As Miss Wardour had surmised, Mr. Aston wished his niece to remove from the farm-house, and take up her abode with him in Cliff Cottage. But Mary declined to accept his offer. She visited her uncle almost daily, and she was glad to receive him in her own humble lodgings. She liked to converse with him of his distant home in the far western wilds of America, and of the cousins living there, with whom she was now anxious to become acquainted. But she preferred to retain possession of the home in which she had spent her evenings with her brother during his final visit to St. David. In her little parlour at the farm-house she could recall to mind her brother's every feature and gesture, and every tone of his voice, more vividly than she could elsewhere; and—it was a foolish idea, but people sometimes cherish foolish ideas—she fancied that if she were to give up that home, the bright hope of her brother's existence in life, and of his eventual restoration to her, upon which she fed, would fade away from her.

Thus three months passed away, and with the arrival of every successive mail-packet from America, during that period, Mary secretly, yet vainly, sought for some confirmation of her hope.

The secret attachment of the young curate to Mary Talbot became known—how, I cannot say—but by some means by which all such secrets become known in small isolated communities; and, now that the young governor's position was altered in consequence of her acknowledged relationship to the wealthy Mr. Aston, there appeared to be no reason why, if the attachment were mutual, the youthful couple should not in due time become husband and wife.

The rector and his niece would have been glad to have seen Mr. Sharpe wedded to Mary. They thought her admirably adapted to become a clergyman's wife. Mr. Aston, had his consent been asked, would not certainly have withheld it, but would have assented, and presented his niece with a handsome dowry into the bargain. Mr. Sharpe was anxious that the period of probation which had been formerly decided upon should be curtailed. In fact, he would have been happy to have had the wedding take place as soon as a reasonable period of

mourning for the (supposed) death of Henry Talbot had elapsed. His mother—a worthy but haughty old lady—proud of the former though now fallen greatness of her own family—had already waived whatever objections she had held, in her desire to see her beloved and only son wedded to the young lady of his choice. In fact, there really seemed to be no obstacle in the way to prevent the marriage from taking place sooner or later. And yet there was one great obstacle—an obstacle that might prove insurmountable. This was the firm refusal of the young lady herself to listen to any arrangements whatever relative to the matter.

It was not that Mary had altered her mind, or ceased to regard the young clergyman with those feelings of affection and esteem without the possession of which she felt that it would be sinful on her part to become his wife. Since she had known Mr. Sharpe more intimately, her affection for himself and her respect for his character had been continuously increasing. She felt assured that she would be happy as his wife; but she refused to listen to any arrangements respecting her marriage, for reasons known only to Mr. Aston and herself—reasons which her uncle vainly attempted to combat, and which she declined to divulge to any one else.

Although, as has been said, she had in a great measure recovered her former cheerful spirits, and was sustained by a secret hope that her brother yet lived and would sooner or later be restored to her, she still felt that a terrible suspicion rested upon his memory. Her uncle professed to entertain the same confidence as she did herself in Henry's innocence; but she doubted the sincerity of his professions, and she felt that, although the suspicions which had once pointed to her brother had been temporarily lulled and seemingly forgotten, they might at any moment break forth again—perhaps through the merest accident—unless the mystery were cleared up and her brother's innocence made manifest, either by himself or by some other means.

"Uncle," she said one day to Mr. Aston, "until the mystery is cleared up, until my brother's character, or his memory, if he be indeed no more, is vindicated from the least shadow of suspicion, I can never—never become the wife of Mr. Sharpe, nor of any other man."

"But, my dear Mary," replied Mr. Aston, "you feel too keenly on this subject. You know my feelings; and you know that it is the belief of all others in St. David, from Mr. Sinclair to the poorest fisherman, that the pocket-book and its contents were lost under other circumstances than those which I at first gave out. In this belief I am desirous that they shall continue until the mystery in which the matter is enveloped shall be cleared up."

Mary shook her head. It was her belief (how could she believe otherwise?) that her uncle still suspected her brother, in his secret heart, and that only in his regard for herself, and his tenderness towards her brother's memory, did he profess to believe that the theft of the pocket-book was shrouded in mystery. She did not blame him. She felt that, were she in his place, she should entertain the same secret suspicions that she believed him to entertain. *She felt and believed* that Henry was innocent. She did not expect that any others, who had not known her brother as she had known him, should believe as she did.

"If Henry should have escaped the perils of the sea, dear uncle," she said, after a pause—and this was the first time that she had ever intimated to her uncle that she entertained the slightest hope that her brother might be still living—"if he should have escaped the perils of the sea, as you did; if he should return to

England, as you have done, would others—if they knew what you know—think of him as they do now? For a while, perhaps, all might be well; but if any trouble were to come upon him, if through some idle gossip any dispute or difficulty were to arise, would not all the former suspicions be cast up against him, unless he were boldly to come forward and vindicate himself? That, in such case, he could, and would vindicate himself, *I* feel assured; but that time may never come. He may never return; the mystery that surrounds the robbery may never be cleared up. Where mystery or secrecy exist, there can never be security; and think, dear uncle, what horror *I* should feel if *I*, as the wife of a clergyman, were to bring odium and disgrace upon my husband, and upon his sacred calling."

"My dear niece," replied Mr. Aston, "you dread what is not likely to occur; and even if your worst fears were to be realised, are *you* to blame because people, whether justly or unjustly, suspect your brother of wrong doing?"

"Uncle," continued Mary, "in the estimation of the world—ever censorious, and perhaps justly censorious in such matters—one member of a family cannot suffer alone under the imputation of crime. Suspicion does not, cannot rest, even though it rest unjustly, upon one of a family, and others escape its blighting breath and influence. Again, *I* say, *I* have a firm belief that some day, perhaps ere long, all will be made clear, and that my brother's honesty and truth will be triumphantly vindicated, or his memory freed from the slightest shadow of suspicion. Until then *I* shall never change my condition; least of all can *I* become the wife of Mr. Sharpe, much as *I* esteem him, strange as he may deem my conduct. A clergyman's wife should be 'like Cæsar's wife, above all suspicion.'"

Mary's voice faltered, and tears dimmed her eyes as she uttered the last words, and for some time the uncle and niece remained silent.

At length, Mr. Aston endeavoured to persuade his niece that it was at least her duty to acquaint Mr. Sharpe with the reasons which had led her to form her present resolve.

"Mr. Sharpe," he said, "is aware that for a short time suspicion was directed towards your poor brother by the village people; but he, and all who had known Henry, were shocked at the very idea. He and they have perfect faith in your poor brother's integrity, and though Mr. Sharpe may feel regret, he cannot but think the more highly of you for having formed this resolution.

"Perhaps," added Mr. Aston, with a smile, "Mr. Sharpe may be more successful in overcoming your resolution, and in inducing you to view the matter in another light, than your old uncle has been?"

Again Mary shook her head. She felt, herself, that it was due to Mr. Sharpe that she should acquaint him with the reasons which had led her to adopt her present resolution; but in doing this, if she were to tell the whole truth, she must acquaint him with matters which were only known, so far as she knew, to her uncle and herself, and she feared that the disclosure would give birth to suspicions in his mind that she shuddered to think of.

Still she thought over her uncle's words. She began to feel that Mr. Sharpe must think her whimsical and changeable—perhaps, in time, he might begin to think that she was unworthy of him. Many a time when they met—and in the regular routine of their several duties they met frequently—she was on the point of disclosing all to him; still, she shrank from so doing:

Three or four months passed away. Several mails had in the meantime arrived from America, and one of these mails had brought strangely confused accounts of the arrival at New Orleans of some of the supposed lost crew and passengers of the Amazon. Some of the newspaper writers seemed to doubt the truth of the report; others stated, that, in the opinion of many who had seen these people, they were impostors, seeking to prey upon the sympathies of the benevolent; others, again, insisted that these poor creatures, who were described as being in the last stage of misery and destitution, were really what they represented themselves to be.

Mary and her uncle read these accounts with the deepest interest; still, they doubted, even if the reports were truthful, whether Henry were among this remnant of the lost crew and passengers of the ill-fated ship. They felt sure, if such had been the case, that he would have written to relieve his sister's mind, and they laid the newspapers sorrowfully aside. Mary, however, urged her uncle to make inquiries as to the truth or falsity of the reports among his friends, and Mr. Aston, at his niece's request, had written to New Orleans, and also to the merchant at St. Louis, as well as to his son and daughter, requesting each and all to furnish him with all the information in the matter that lay in their power. They both hoped that the mail-packet that would be due in a few days would bring them the information they sought.

With a mind full of anxiety, Mary went one afternoon to visit an aged invalid who resided at a distance from the village, and near Dame Hoolit's cottage, whither she had gone to visit the sick child on that afternoon when she had first heard of the robbery of the pocket-book.

She and the curate met at the cottage of the invalid, and they set out together to return to the village. Mr. Sharpe was quick to remark the pre-occupation of the young lady's mind, and in a voice full of sympathy he inquired the cause of her evident anxiety.

Mary told him of all that she and her uncle had read in the American newspapers, and explained that her anxiety was caused by her expectation that the next packet would bring replies to her uncle's inquiries, and her dread lest those replies should prove unfavourable to her hopes.

Mr. Sharpe dared not attempt to re-assure her. He, like all her other friends, entertained no doubt that Henry had perished at sea; but he sought to arouse her from her despondency, and the conversation changed from one topic to another, until at length, for perhaps the twentieth time, he besought her to give him some explanation of the cause of her estranged behaviour towards him.

Mary had been deeply touched by his kindness and sympathy, and his patience with her, under circumstances that might well have aroused his indignation, and she confessed the reasons which had induced her to form the determination at which she had arrived. This confession, strangely enough, was made on the very spot where she had first heard from her companion's lips the story of Mr. Aston's loss, when, as now, she was returning home from visiting the sick.

Mr. Sharpe endeavoured, as she had anticipated, to combat her resolution. He avowed that her fears were groundless; that no one had really suspected for a moment that her brother knew aught of the theft. In fact, he said, Mr. Aston himself had acknowledged that he had probably been mistaken in his supposition that he had been robbed on the beach, and everybody else was satisfied that the pocket-book had been previously lost in Falmouth.

"The people of the village," he went on, "cruelly and unjustly directed suspicion towards your brother, because they felt that they were unjustly accused. They no more believed that your brother was guilty of the crime than you or I do."

"Still," said Mary, almost wavering in her resolution, "they may, as cruelly and unjustly, raise those suspicions again."

"And as my wife, dear Mary, they would the less dare to do so; and were they to do so, you would find me ready to support and defend you. Do you fancy for a moment that idle clamour and vain gossip could prejudice me? But it is folly even to fear such base insinuations, that none save yourself would ever dream of."

"You fancy *now* that you could brave all such mortifications, Alfred," replied Mary; "but it would be different were they really to come upon you. You would then repent of your generosity, and blame me, justly, for having taken advantage of it."

"Never, Mary. I should never blame *you*," said the curate. "I should not blame you even if it were possible that there were a grain of truth in such aspersions. But it is impossible—utterly impossible."

"And then," continued Mary, "there are others to be thought of. Your mother——"

"My mother," interrupted the curate, "has, although she has never seen you, learnt to regard you as a daughter through what I have told her concerning you. She longs to see and know you. I am amused sometimes to see how large a portion of her letters are occupied with questions about you, and expressions of her desire to become acquainted with you. Stay: you are smiling doubtfully; but to convince you of the fact, I have a letter from my mother in my pocket, yet unread. It was handed to me by the carrier as I came through the village, and I put it into my pocket to read quietly on my return to my lodgings. I will read it now, and will guarantee, ere I begin, that I meet with your name before I have read ten lines."

He stopped, and, drawing the letter from his pocket, broke the seal and began to read.

Mary stooped to pluck a wild-flower, and when she rose, said smilingly—

"Well, have you forfeited your guarantee, or——" she checked herself as she looked up into the curate's face and remarked the change that had come over it. He appeared to be annoyed, or distressed, and she went on. "You have received some ill news. I am sorry——"

"No, no. No ill news," he hastily replied. "But it annoys me. It is absurd—ridiculous. I will not believe it. My mother should know better than to listen to such nonsense."

"It does not relate to me, I hope, Alfred?" said Mary, speaking as if in jest, but feeling a sudden pang at her heart.

"No, no. That is, it does relate to you, Mary," replied the curate, hesitatingly. "But it is sheer nonsense. I shall write and tell my mother so at once."

"You will tell me what it is?"

"No. It would annoy you to no purpose, Mary. I am sorry now that I spoke of the letter."

"Alfred," said Mary, "I must entreat you to tell me what it is that annoys *you*, that relates to *me*. I have a right to ask. You should have kept silent if you wished to withhold the matter from *me*, though, under any circumstances, I have a right to know what is said to my prejudice. I claim that right."

"It is such a piece of wicked, malicious nonsense,

Mary. Better let me destroy the letter, and deny the story of which my mother speaks."

"You have no right to deny what you cannot prove to be false," said Mary. "Let me know what your mother has written. If it be false, I will empower you not only to deny its truth, but I will enable you to prove its falsity."

"You will be angry, Mary, and with reason. Still, if you insist. But mind, I disbelieve it *in toto*. Do not, therefore, be angry with *me*? Now listen—"

"After inquiring, as usual, after your health, my mother goes on to say—Really, Mary, I cannot repeat such scandal. If you *will* know what she has been foolish enough to listen to, you must read it yourself. But recollect, I say, before you read it, that it is an abominable piece of scandal."

Mary received the letter from the curate's hand, and glanced at the paragraph he pointed out to her. The writing seemed to swim before her eyes, and the paper fluttered in her trembling fingers. Nevertheless, she read the paragraph to the end.

It ran as follows:—

"I wish, my dear Alfred, to think kindly of Miss Talbot, for your sake; and, without having yet seen the young lady, I have schooled myself to believe that I shall find in her all that I can require in a daughter-in-law—in the wife that is to be of my only son. Nevertheless, I have heard a strange story, which I am unwilling to credit, yet which, if it be true, and cannot be satisfactorily explained, must necessarily alter, or altogether put an end to, the existing state of affairs between Miss Talbot and yourself.

"You will recollect telling me, on the occasion of one of your visits, the particulars of a serious loss sustained by the Mr. Aston (who has so singularly turned out to be a long-lost uncle of Miss Talbot's), under very peculiar circumstances, and while he was walking on the beach with Miss Talbot's brother.

"You said that Mr. Aston believed that he had been robbed while in a state of unconsciousness, by the fishermen who carried him home to his dwelling, and that, among the property of which he had been plundered, was a costly trinket—a locket, which he especially valued as an heirloom, and which was engraved with his family crest and motto—and (if I am not mistaken) you added, that though the gentleman refused to prosecute, you would not be surprised if, some day or other, the thief or thieves were to be discovered through this trinket.

"This brings me to my story.

"The other day Betsy Hoolit, whom I engaged as a housemaid, through your recommendation (and who, by the way, seems to be a very decent girl, though somewhat prone to gossip), went home to visit her mother at St. David, and on her return she told me, as a piece of wonderful news, that her mother knew who had got the 'lock-up,' she called it, that the stranger gentleman, Mr. Aston, had been robbed of.

"Now, my dear Alfred, I do not encourage tales and gossips among my servants; but I confess that, in this instance, my curiosity was excited, and I asked who was in possession of the trinket.

"The young woman hesitated somewhat, and then replied—

"I don't know as I ain't doing wrong in speaking on it, mum; because mother says as it's a secret, and the young lady as has it have been very kind to my little niece, who have been ill; but I'm sure, mum, as you'll not go for to tell on it. It be Miss Talbot, the governess, mum, whose brother was a walking with Mr. Aston when he were tuk ill. Mother went to Miss

Talbot's lodgings to ask her to come and see her gran'darter, and the governess were not at home, so she waited, and she see a curious thing as they calls a "lock-up," all goold and figures, in Miss Talbot's drawer, which was open, and nat'rel she looks at it, and puts it back ag'in; and, when Miss Talbot come in, she went quick to the drawer and shut and locked it, as if she hadn't wanted mother to see what were in it.

"Mother went home, and thought nothin' more of the "lock-up," but it happened that very arternoon, when Miss Talbot came to see my little niece, mother first heard of the robbery, and how a goold "lock-up" were among the things as was stole.

"The fishermen was blamed, mum, but mother says it's more likely as the governess's brother, as was walking along with Mr. Aston, stole the pocket-book and the money, and g'in the "lock-up" to his sister; and that's why the genelman as is her uncle won't make no fuss about it.

"But you'll say nought about it, mum, please." And so Betsy ended her story.

"Now, my dear Alfred, this may be merely a piece of idle village gossip. Still, it *may* be true. You will acknowledge yourself that it has a suspicious look, and I wish you, as cautiously as possible, to endeavour to find out whether the girl has spoken the truth.

"Under any circumstances, I do not for a moment suspect that Miss Talbot had any knowledge of the robbery. Still, *if* her brother was concerned in it (and you know Mr. Aston declined to prosecute), you could not retain your present relations with the young lady, even though you were *not* a clergyman. However, I will say no more about the matter now. Your own good sense will urge you to take such measures as may be necessary to ascertain whether Betsy's story be or be not mere idle gossip."

Mary read this long extract through to the end, and then, with a pale face and with compressed lips, handed back the letter to the curate.

Mr. Sharpe fancied that the emotion she betrayed was caused by indignation.

"Is it not *scandalous*?" he cried. "You insisted upon reading it, though I told you that it would excite your just anger and indignation. Now, I shall write to my mother, and, much as I respect and love her, I shall tell her plainly that she did very wrong to listen to such scandal from a servant. Moreover, I shall beg her instantly to dismiss the young woman, and I shall call on Dame Hoolit, and—"

Mary by this time had gained strength to speak.

"You need take no such trouble," she said, calmly, interrupting the curate's flow of indignation. "I regret the construction that Mrs. Sharpe has erected upon the tale of a servant; but it is quite true that I possess the locket. Mr. Aston is aware of it."

"He gave it you himself, then?" cried the curate, eagerly. "It was not stolen with the pocket-book, after all?"

"It was lost with the pocket-book, and it was given to me by my brother before I—and I believe, as surely as I stand here—before he knew aught of the robbery."

"Poor fellow! I believe he never *did* know of it."

"I remember seeing Dame Hoolit standing near the open drawer of my writing-desk when I entered the room, and, blaming myself for leaving temptation in the way of any poor person—for there was also money in the drawer—I closed it hastily; not that I really suspected the old woman of dishonesty, and certainly not because I then wished to keep the fact of my possession of the

trinket a secret from any one: So you see that Betsy Hoolit has merely told the truth, only she, like Mrs. Sharpe, has placed a false construction upon my action."

"But how—by what means did your brother obtain the locket?" asked the curate, hesitatingly.

"Honestly, I truly believe. How I cannot say. He told me nothing more than that he bought it, because it was engraved with the crest of my mother's family, and contained a portrait (my mother's) that resembled me. Where he bought it I did not think to inquire."

For some moments Mary and her companion walked on in silence. Then she again spoke, though her voice trembled with emotion.

"I feared this," she said; "and I thought it were better that we should cease to be what we have been to each other. I knew that, should suspicion, though that suspicion be false and groundless, close around me, you could no longer regard me as one fit to become your wife; and believe me, I do not, cannot blame you."

Still the curate made no reply; and when at length they reached the end of the lane, Mary wished him good afternoon, and was about to turn aside in the direction of her own lodgings. Then, however, he held forth his hand.

"We must not part thus," he said. "I am amazed at what I have heard. It has come upon me so suddenly. Believe me, Miss Talbot, when I say that I think of you still as I have always thought of you. Do not on your part judge me unjustly. Before I reply to my mother's letter I must see you again. I wish with all my heart I had never mentioned the letter."

"It were better as it is," replied Mary, as she withdrew her hand. And thus they separated, each walking away in the direction of their own home.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

W. WORDSWORTH.

In reproducing a characteristic letter of the poet, I have no comment to offer. It touches upon several topics on which it is interesting to have the opinion of such an authority, and seems to me very strongly to indicate that sound sense can be closely allied with "the sounding verse." In consequence of a conversation in which he criticised some of the sights of London, especially, as I remember, an eccentric "Jessica," by Turner, in the Exhibition, and a ballet at Her Majesty's Theatre, in a very entertaining style, a liberal honorarium was proposed for an itinerary of his trip to the continent, upon which he was then starting. The Mr. Reynolds mentioned was son of the dramatist, himself the author of the striking volume of "Miserrimus," and at this period projecting the annual—the "Keepsake"—which he afterwards edited.

DEAR SIR,—Your letter of the 23rd August I did not receive till my arrival here several weeks after it was written. My stay in London was only of a few days, or I should have been pleased to renew my acquaintance with you.

I really cannot change my opinion as to the little interest which would attach to such observations as my ability or opportunities enabled me to make during my ramble upon the continent, or it would have given me pleasure to meet your wishes. There is an obstacle in the way of my ever producing anything of this kind, viz., idleness; and yet another, which is an affair of taste. Periodical writing, in order to strike, must be ambitious, and this style is, I think, in the record of tours or travels, intolerable, or at any rate the worst that can be chosen. My model would be Gray's Letters and Journal, if I could muster courage to set seriously about anything of the

kind; but I suspect Gray himself would be found flat in these days.

I have named to Mr. Southey your communications about Mr. Perceval's death; he received them, and wrote you a letter of thanks, which by some mishap or other does not appear to have reached you.

If you happen to meet with Mr. Reynolds, pray tell him that I received his prospectuses (an ugly word!) and did as he wished with them.

I remain, dear Sir,
Very sincerely yours,

Rydal Mount, near Ambleside,
October 7th.
W. Jerdan, Esq.

JAMES HOGG, THE ETRICK SHEPHERD.

Of the Ettrick Shepherd I have spoken in the "Leisure Hour" (No. 411) and elsewhere, so that nothing remains for me to say here, avoiding repetition, but that in nature he was as singularly an open-hearted man as if he had the fabled glass in his bosom, and entirely possessed by the impulsiveness that pertains to genius. The annexed letter will illustrate the latter feature under his own hand; and I have only to explain that on his visit to London he frequently met a charming young girl at a private house, with whom he chose to fall in love, *quasi prozy*; and so, having arranged matters in his own mind (just as if planning a new poem), on his return home made the proposal in serious earnestness:—

Alhvie Cottage,
Dec. 27th, 1832.

MY DEAR FRIEND,—I received yours safely, with the bill of exchange enclosed, on the day of the election at Selkirk, where of course we were outvoted. There is such a revolutionary mania abroad that it is quite needless to speak to people; even the eloquence of the Shepherd failed in a place where he is perfectly understood, and the Tories lost by eight votes! * * I would like to know from whom the note came, as I want you and Lockhart to keep a correct list of the subscribers, and publish them in the same way as those for the memory of Sir Walter. But you are the man for these things. I am fully persuaded that you can do more in furthering any benevolent action than all the literary men in Britain put together.

I said nothing to William [his nephew] that my suit had been so equivocally received by the lovely Mary. But I will not, I cannot, give up the hopes of yet having her for my niece, and of her forming by-and-by one of our family circle. I assure you she shall be wooed in due form; but how to effect it I do not know. Does she never visit Kelso? There never was a match my heart was so much set on as that, not even my own marriage, and I got a very lovely and amiable lady; for I regard William as quite a treasure, both for intelligence and gentlemanly demeanour, and since he is come home for a wife, and can so well afford to keep one, I would like that he should take out the flower of his country with him. It is only for a few years; and according to him, the greater part of the Bombay presidency is a very fine and a very healthy country, except for children. He neither requires nor desires any tocher or provision, but merely a helpmate whom he can love and cherish. Don't hand my off-hand letters over to Mary, the wild, sly-looking gypsy. I am even terrified to think of that; but let us suggest some possible plan between ourselves. The allowing a small siege of [blotted] is no departure from the noninterference system.

Alas! what can I do in this wilderness towards the furthering the subscription to commemorate Sir Walter? They have made me a member of committees in London, Glasgow, and Edinburgh, but I can do nothing. Only, as I have written to them all, I request and beseech that, in the first place, that the estate, house, library, and armoury of Abbotsford may be secured to him and his lineal heirs for ever; for that is a great and splendid monument of his genius and research, and the monument that will always be visited in after ages in preference to any other; and people will be proud to possess a stem of

the fruit-trees which he planted with his own hand. Indeed, the idea of raising stone and lime monuments to Sir Walter appears to me quite ridiculous, with the exception of something in Westminster Abbey and Abbotsford. Stick by that, To him and his lineal heirs for ever. I am the more anxious about this, as the next lineal heir to the present Sir Walter is likely to be Wat Scott Lockhart. All other monuments are vain. He has raised two monuments to himself, in building and literature, which are far beyond what any other architect can produce. There is an apt quotation from Horace, but I dare not quote it for want of proper Latin.

As this will reach you about the very day I reached your hospitable dwelling last year, please shake hands with all the interesting family in Grove House, and wish them all a good new year, and many happy returns of the season in the Shepherd's name. You have not said a word about my Tales, which, in the way I have altered and renewed them, I think will do me great credit, and, if in good hands, would, I am sure, bring me great profit. Cochrane has applied for the continuance of them, and as no others have applied I have promised them, with Lockhart's acquiescence.

I would like to have your sentiments about this. It can be no loss to me any way, and if they sell well I shall surely get my share. Smith and Elder have proffered to publish them for me and give me the whole profits; but then I was to give them securities to the extent of £200. As such a thing never had been required, I was perfectly indignant, and refused, thinking the edition in their hands perfect security. As I do not like to offer them to anybody, and no one has applied for them since Smith and Elder's strange conditions, I know not well what to do. I suppose Cochrane must have them. I think him an exceedingly simple good-hearted fellow, with a great deal of ambition and very little calculation how to obtain his object. But I am merely prosing.

God bless your kind heart! Amen is the sincere prayer of
Your most affectionate Shepherd,
JAMES HOGG.

To Wm. Jerdan, Esq.

The marriage proposal occasioned much mirth to the juveniles in the secret, as, unluckily for it, it happened that the wooed one was pre-engaged. Since writing, I observe that the "Quarterly Review" relates some instances of coarse manners on a visit which the Shepherd paid to Abbotsford, and in a letter addressed to Sir Walter Scott. These, I take upon me to say, must have been early ebullitions, such as I have described, as too often disfigure the poetical temperament; but, as I stated of Maginn, the Shepherd knew nothing of bitterness or malevolence, and in a brief intercourse with the world he acquired not only an easy deportment but a happy style, which generally captivated individuals, and literally carried social companies of every class along with him in the outpourings of his natural humour.

I am tempted, by its relation to the Shepherd, to publish parts of a letter of this period, which I trust many readers will excuse, on account of the particulars it contains respecting several men "noticeable" in their day in productions of art, then in the zenith of popularity. It is from John Field, the celebrated profilist, and its want of regular sequence may be pardoned because of my difficulty in divesting it of much of a personal rupture between the writer and his co-partners, the elder Miers and his son, both widely-patronised profilists:—

March 22nd, 1832.

SIR,—I have the pleasure to forward for your acceptance the two enclosed profiles taken from life, one of Mr. James Hogg, the Ettrick Shepherd, who lately sat to me; the other from an original outline in black, which I possess, of Robert Burns, taken many years ago by the deceased Mr. Miers (when in Edinburgh) to whom I engaged myself to execute his profiles from the year 1794 to 1821 inclusive, having in that space of time completed many thousand likenesses to which he attached his name, whereby he acquired a fortune and great reputation in this country to works executed solely by me! On my joining Mr. Miers I found his profiles had been performed by Mr. Barber (now John Thomas Barber Beaumont, Esq., the

managing director of the Provident and County Fire Offices), who had nearly completed his engagement of three years with Mr. Miers as his profile painter, and to this person I am indebted for my instruction, on his leaving for his present lucrative greatness.* On the death of Mr. Miers, in 1821, I was prevailed upon to join his son William Miers in partnership, to continue the profiles, he well knowing my own works to realise from twelve to fifteen guineas per week. I conducted them in the partnership for nearly eight years; they were sent out as the work of Miers and Field.

[He then mentions outlines of persons whose profiles were taken by him in the elder Miers' time, and for which applications were constantly being made for duplicate copies by the friends and relatives, without emolument to him as the original artist.]

I beg leave, in concluding, to observe that I have been appointed by her Majesty's warrant, bearing date the 24th of August, 1830, to be her Majesty's profilist, as also to his Majesty, as communicated by him to her Royal Highness the Princess Augusta, for whom I have executed profiles.

I am, Sir,
Your obedient servant,
JNO. FIELD,
No. 11, Strand.

To William Jerdan, Esq.

SIR DAVID BREWSTER.

Covered with tributes of honour from every quarter of the globe, an old friend has lately finished his mortal span. It is neither the time nor the place for me to discourse upon his many virtues and altogether most estimable character. In his elevated intellectual course he was all that might become a man. Gifted, diligent, persevering, he passed nobly through his long course.

Incidentally, within a few hours of hearing of his death, the annexed letter turned up among my papers, and I at once recognised it as well suited to these selections, and offer it to my readers as a striking trait of the writer's ambition to deserve honest fame, his devoted perseverance—truly *nulla dies sine linea*—and his cordial gratification in receiving the scientific distinctions which were showered upon him, and even extorted from an Arago, the last scientific man in France to acknowledge British merit. It is short and simple, but it tells its tale:—

MY DEAR SIR,—I beg to thank you for the copy of the "Literary Gazette," and for your very kind notice of my election as one of the Foreign Associates of the National Institute. I never saw the state of the election till I read it in your number. The event has been very gratifying to me on many grounds, but particularly from the liberal conduct of MM. Arago and Biot, who were members of the Commission, who unanimously agreed to place my name on the first line, as they call it, for election.

I hope we shall meet at Birmingham, if not earlier.

I am, my dear Sir,
Ever most faithfully yours,

St. Leonard's College,
Jany. 23rd. 1849.
William Jerdan, Esq.

An anecdote, not less characteristic, may, I hope, add something of interest to this brief record. Dr. Paris wrote an amusing volume, entitled "Philosophy in Sport," and, as far as my experience goes, I know no

* With this gentleman I had the pleasure of a cordial acquaintance. His active benevolence and munificence in founding and fostering charitable and patriotic institutions are well known. His energy was untiring. I remember his strenuously urging me to espouse the cause against Lady Byron on the rupture with her husband, but I had had enough to do with his lordship, and no desire to take his part in a quarrel of which the mystery is yet unrevealed.

class of mankind who do enjoy recreative sport so cordially as the philosophers. But be that as it may, Sir David Brewster was one, and Mr. (now Sir Charles) Wheatstone (well deserving to be bracketed along with the foremost of the age) was another, who acted in the little drama. I can hardly describe it, so as to afford an idea of its merriment and laughter. It was after the Bristol meeting of the British Association. These eminent men were, by their country engagements, thrown into companionship with my daughter, her husband, and myself. We had to ascend a Monmouthshire hill together, and the humour veered into a proposition then mooted, that by a certain division of labour any body of people might climb an Alp without the expenditure of any muscular waste, or the sufferance of any physical fatigue. The experiment in proof was suggested by Brewster. He went in front; my daughter held on by his coat-tails, her husband laid hold of her gown, Wheatstone held fast by his coat-tails, and I communicated firmly by the skirts of the founder of the electric telegraph. Thus, in train, and all stooping in canine posture, we commenced, like John Anderson and his wife, to "climb the hill together." Of the success of the experiment I cannot speak positively. Like a good objector, I can only say it was not fairly tried; for very soon we all laughed so much as to be incapable (even if the London police had been there) to "move on." The problem, therefore, was left unsolved; but we demonstrated the philosophic truth of the *dulce desipere*. Oh, for a photograph to have pictured the scene!

HINTS ON SICK-NURSING.

BY A DOCTOR'S WIFE.

THE portrait of Florence Nightingale will suggest far more than we need express in words; for her truly womanly mission in going out at the head of a small body of nurses, in the face of countless dangers, to tend our wounded soldiers in the Crimea, is known to every British subject. A testimonial fund of £50,000, raised in acknowledgment of her services, which was at her special request spent on the establishment and maintenance of an institution for training nurses, shows how generally her work was appreciated; but few, except her personal friends, know the self-devotion and energy she brought to bear upon her task, or the difficulties she surmounted.

Florence Nightingale, the youngest daughter of W. E. S. Nightingale, of Embley Park, Hampshire, and Lea Hurst, Derbyshire, was born at Florence in May 1820. She enjoyed all the advantages of education which wealth could command; it was said of her—"In knowledge of the ancient languages, and of the higher branches of mathematics, in general arts, science, and literature, her attainments are extraordinary. There is scarcely a modern language which she does not understand, and she speaks French, German, and Italian as fluently as her native English."

It is also recorded of her that "the schools of the poor round Lea Hurst and Embley first felt her kindly influence as a visitor and teacher." But from early childhood her great delight was to minister to suffering. The little girl would bind up the broken limbs of her dolls; the young maiden would visit and soothe the young and suffering on her father's estates. But when she attained womanhood she craved a broader scope for her special instincts, and she gathered fresh knowledge from visits to the reformatories and hospitals of London and Edinburgh. In 1851 she sought further

experience by spending three months in the German institution at Kaiserwerth. On her return to London she devoted her personal services and private means to re-organising the Hospital for Sick Governesses in Harley Street. In 1854, at the request of the War

rally far into the night before she again reached her quarters."*

After her return to England, in 1856, her health suffered so severely from all she had undergone, that she was debarred from active service, but her pen has been

Florence Nightingale

Secretary, she took the conduct of a body of nurses sent out to alleviate the sufferings of our soldiers in the hitherto woefully mismanaged hospitals at Scutari. What her ministrations were there is best described by the pen of an eye-witness.

"Night is specially trying to the sick and wretched; then on all sides arose the moans of pain or the murmurings of delirium. At this period there were no night nurses; but Miss Nightingale, lamp in hand, each night traversed alone the four miles of beds. How many lives this lady has been the means of saving during these rounds, by calling medical aid, or by administering little alleviations, is known only to herself and to the Unseen, who watches our steps. She was peculiarly skilled in the art of soothing; her gentle, sympathising voice and manner always appeared to refresh the sufferer. It was gene-

busily at work. In 1859 she published "Notes on Hospitals," and in the same year, "Notes on Nursing," a book rich not only in the dictates of good sense, but in such enlarged experience as few women possess. We earnestly wish the maxims of this book were more known and acted upon by English women. Every woman cannot be a Florence Nightingale, but every woman is more or less called to nurse the sick; and unfortunately it is a most fallacious idea that every woman is a born nurse. No one can be a nurse without a fair share of that most uncommon quality, common sense—and a professed nurse requires more; the ear, the eye, the mind, must be educated for this as for any other profession. The art of bandaging, dressing wounds, making sick-beds, applying

* "Experiences of an English Sister of Mercy."

blisters, leeches, etc., is best learned practically at a hospital; and here too the method, punctuality, and petty management required by the sick is best studied. Hospital training is now open to ladies whose natural tastes, health, and freedom from home claims leave them free to choose nursing as their vocation.* But comparatively few ladies can avail themselves of such opportunities; for one woman who can be taught nursing in a hospital, there are thousands of mothers, wives, daughters, and sisters who have to nurse sick relations, and hundreds of patients who are sacrificed unnecessarily to the ignorance and incapacity of their attendants. This applies as much

hardly have one child out of every seven in England, two children out of every five in London, die before they are one year old, if mothers knew and acted on those general laws of health which in God's providence cannot be broken without entailing illness or death.

We venture, then, to throw out a few hints for nursing, gathered partly from observation, partly from the experience of Miss Nightingale and others, premising that they are only hints; for the requirements of the sick are as varied as their complaints, and nothing but practical observation, directed by ready tact and forethought, will make a woman a nurse.

LEA HURST, THE EARLY HOME OF MISS NIGHTINGALE.

to the rich as to the poor. In serious illness a poor patient is removed to a hospital, where he has not only the best advice, but the most skilful nursing, and hospital patients sometimes recover from diseases which prove fatal in private cases.

Can a woman, then, train herself, or be trained, in family life, for those duties to the sick which will infallibly devolve upon her sooner or later? We believe to a great extent she may, and ought to do so. Moreover, the knowledge required for efficient sick-nursing is as necessary for the healthy as the sick; it is chiefly the knowledge of those physical conditions, those laws of health, which are quite as needful to maintain health as to assist in its repair when broken. Child-life is the most delicate test of healthy conditions, and we should

* The Nightingale School has accommodation for eighteen free probationers, and five special or paid; these latter must be women of education and good social position, to whom the superintendence of the nursing and nurses in hospitals and general and workhouse infirmaries may be with confidence entrusted; no menial service will be required of them. Before admission, personal application should be made to Mrs. Wardroper, St. Thomas's Hospital, Newington, Surrey, S. The regulations and previous information required may be obtained by writing to the Secretary, H. Bonham-Carter, Esq., 91, Gloucester Terrace, Hyde Park, W.

I. *Pure Air.* Miss Nightingale tells us—"The very first canon of nursing, and the first and the last thing upon which a nurse's attention must be fixed, the first essential to the patient, is to keep the air he breathes as pure as the external air, without chilling him." If food and medicine be important, the air breathed is tenfold more so. We eat three or four times a day, we breathe sixteen or twenty times in a minute, and on that breathing depends the renovation of our whole system. Poisonous influences are more directly absorbed by the blood when breathed than when swallowed. Our own breath is poison even in health; the crowded work-room, the unventilated school, the close bed-room, are poisonous with carbonic acid gas; but also the air in an uninhabited room, if shut up, becomes stagnant and positively injurious. There must be a current of air to ensure healthy ventilation; one inlet is not enough: there must be a window and open chimney. It is always best to air from without, from the fresh open air. What is the use of airing a room by opening the door into a passage full of house smells, mustiness, and shut-up air? But nurses are so afraid of giving their patients cold by exposing them to a draught. Of course,

when the window is open the door must be shut; but there is little or no danger in opening the window when the invalid is warm in bed. The time to be careful about a patient's catching cold is when he first gets up after the continued perspiration of days in bed, and the effort of dressing, as at such times he is peculiarly susceptible. Then warmth is essential; but warmth may be secured by other means than shutting up a room, such as hot bottles, a good fire, and warm though not heavy clothing. And fresh air does not mean a draught. The window should be opened from above, or the room should be furnished with a ventilator near the ceiling. The simplest and best we know is one invented by Squire (the Queen's chemist); it consists of an oblong hole cut through the wall to the open air, close to the ceiling, furnished with a grating outside, and a valve which can be opened or shut at pleasure from within. This ventilator may be adapted to any flat-ceiled room for about fifteen shillings. The air as it enters clings to the surface of the ceiling, and only gradually diffuses itself, creating a pleasant freshness without any sensible draught. Another way of airing a room without draught is to have a piece of wood, some inches deep, fitted to the bottom of a sash window; the sash is opened and closed again upon the wood; the current of air which now steals in between the lower and upper sash is directed upward, and while no sensible draught is felt even under the window, the room is effectually ventilated.

An intelligent testimony to the value of open windows was given by a poor woman. "Ah! that was a wonderful evening when you told us what air we could live on, and what we couldn't. I says to Mrs. L., as we were going home, 'There, now, we've been a shutting up our windows, and thinking we were shutting the pizen out, instead of which we were shutting it in. I soon got my window made to open at the top, and it has never been quite shut since, for we always sleep six in this room. The neighbours did say at first that we should catch our deaths, but they soon saw that we were so much better, that half the people in the streets open their windows at the top now.'"

The nurse must be equally careful to remove from the room everything that can taint the air. Bed-hangings, window-curtains, carpets, are all absorbent, and noxious effluvia will cling about a woollen substance for months, being given out whenever the air is damp. Generally speaking, the lighter and more free from furniture a sick-room is, the better.

II. *Cleanliness.* Another all-important duty of the nurse is to look well to the cleanliness of her patient. The thousands of small pores which you may perceive on the surface of the skin are all the outlets of so many tiny pipes conveying waste matters out of the system. Every healthy person steams from one to one-and-a-half pint of moisture from the skin in twenty-four hours; in sickness, perspiration is often much increased, for in many important diseases nature relieves itself almost entirely by the skin. But perspiration remains on the skin, clogging its pores unless washed away; and if this be neglected, the patient will suffer from skin-poisoning. Every one knows the comfort and physical relief of a good wash; none experience greater benefit from it than the sick; but with them, as the power of reaction is small, care must be exercised not to expose too great a surface at once, so as to check perspiration, which would renew the evil in another form. It should also be remembered that soft water should be used, not hard.

For "water dressings" soft water is absolutely necessary; hard water produces an opposite effect. If soft water cannot be got, you must collect rain water, or, failing this, boil the water, which removes half its hardness.

In fevers great relief is frequently found in sponging the face and arms with quite hot water. Restless patients are often soothed by having their feet bathed with water as hot as they can bear, and dried with a hot towel; but the bed must be previously protected by a mackintosh and towels spread underneath the feet.

Cleanliness in bedding and clothing is not less essential. Much of the moisture of which we spoke saturates the bed-clothes and linen of the patient. Hence, frequent change of linen is necessary for an invalid. The poor, who cannot afford frequent change, should have at least two of each article in wear, *i.e.*, two night-shirts and two pairs of sheets, that those not in wear may be hung out of the window, or in a yard, and purified by exposure to the open air, being well warmed before they are again used. If possible, no soiled garment or bedding should be aired in a sick-room. If the invalid is able to rise, his bed should be entirely stripped and exposed to the air. A spring mattress is the most healthy and comfortable for the sick.

Again: *all the things about a patient should be kept clean.* The floor and furniture must be carefully wiped with a damp cloth, to avoid raising dust. The medicine glasses should be rinsed and wiped whenever used. In giving liquid food, see that none is spilled into the saucer, or it will drop on the sheet or bed-gown. Before every meal spread a clean napkin from the chin of the invalid to the tray, to catch any crumbs which may fall, and which are a great worry to the sick, if they get into the bed. These minute things make a real difference in a patient's comfort and his willingness to take food.

A nurse's duties are positive as well as negative; not only is watchful attention to ventilation and cleanliness needful to protect the sick from injurious influences, but any vital power they may have must be cherished and strengthened; for it is their best hope of throwing off disease or living through it. In nursing, it eminently holds good, "A penny saved is a penny gained." The doctor alone may prescribe tonics, but the nurse may economise the strength of her patient by attending to his warmth, rest, and food.

III. *Warmth.* If some substances, such as starch, fat, and sugar, are burned in the open air, they disappear, changing into carbonic acid and steam. Such changes are always accompanied by light and heat, or, if more slowly effected, by heat only. Now, such changes are continually going on within us, and are the continuous natural source of our animal heat. While part of our food, the gluten, fibrine, and curd goes to repair our wasting frames, a scarcely less important part, the fat, butter, sugar, etc., forms fuel for the vital fire on which our warmth depends. Any cause, then, which reduces the temperature of the animal makes a demand upon its substance. Now, "in certain diseased states much less heat is produced than in health, and there is a constant tendency to the decline and ultimate extinction of the vital powers by the call made upon them to sustain the heat of the body. Cases where this occurs should be watched with the greatest care from hour to hour, almost from minute to minute. The feet and legs should be examined by the hand from time to time, and whenever a tendency to chilling is discovered, hot bottles, hot bricks, warm flannels, with some warm drink, should be made use of, until the temperature is restored. The fire should be kept up. Patients are frequently lost in

the latter stages of disease from want of attention to such simple precautions. A patient may sink from want of a little external warmth. Such cases occur even in summer; this fatal chill is most to be feared towards early morning.*

Warmth must be *judiciously* applied; for instance, blankets should never be doubled over the chest, as weak patients are always oppressed by weight of bedding. Again, hot bottles must not be filled with *boiling* water, nor left in the bed when cold. You should always be able to touch a hot bottle with your naked hands; if it is required to keep hot some hours, it should have a flannel cover or bag.

IV. *Sleep.* Who can estimate the renovating power of sleep? During sleep all the processes of life go on more slowly; the wear and waste of substance is so much less than in waking as to justify the expression "nourishing sleep." Never allow the sick to be waked; if you let them be roused out of their first sleep you secure a bad night for them. Be absolutely quiet while a patient is *trying to get to sleep*; whatever has to be done must be left rather than risk his night's rest by fidgeting about. Far better wake him after some hours of sleep than rouse him when drowsy; for sleep perpetuates itself, and in sickness the more a sick man sleeps the more power he will have to sleep. A good nurse ought to be able to change warm bottles, and even to give nourishment during sleep, without rousing the invalid. A comfortable arrangement of the pillows helps to sleep. This requires some little knack. "Every weak patient, be his illness what it may, suffers more or less from difficulty in breathing. To take the weight of the body off the poor chest, which is hardly up to its work as it is, ought therefore to be the object of the nurse in arranging his pillows. Now, what does she do, and what are the consequences? She piles the pillows one a-top of the other like a wall of bricks. The head is thrown upon the chest, and the shoulders are pushed forward so as not to allow the lungs room to expand. The pillows, in fact, lean upon the patient, not the patient upon the pillows. It is impossible to give a rule for this, because it must vary with the figure of the patient. But the object is to support, with the pillows, the back below the breathing apparatus, to allow the shoulders room to fall back, and to support the head without throwing it forward. The suffering of dying patients is immensely increased by neglect of these points."†

All noise is painful to the sick, but sudden or unnecessary noise is far the worst. Any noise which excites expectation, such as a slow, shuffling step, or a whispered conversation, is to be avoided. A nurse should have a light, quick step, and a noiseless dress; the rustling of silk, the creaking of hinges or shoes, and the rattling of window-frames or flapping of blinds are peculiarly irritating to nerves rendered sensitive by fever or weakness. It needs but little care (a touch of oil, a wedge of paper, a stout stick to stir the fire, etc., etc.) to avoid them, and the patient should never have to tell you of them. Never speak to your patients while they are moving, or keep them standing, or interrupt them when occupied, or jar their bed or chair by leaning against it.

V. *Food.* Thousands of patients, we are told, are annually starved in the midst of plenty, not from neglect but from ignorance. A patient may only be able to take food at particular hours, or he can take some particular kind of food at one hour which he cannot at another.

Chronic cases of illness tax all the ingenuity, perseverance, and observation of a good nurse, and in careless hands become cases of protracted starvation. "As a general rule, weak patients cannot take solid food before 11 A.M., and yet require liquid food to sustain them from hour to hour; a spoonful of beef-tea, arrowroot and wine, egg-flip, every hour, will give them the requisite nourishment and prevent them from being too much exhausted to take at a later hour the solid food which is necessary for their recovery. Every patient who can swallow at all, can swallow those liquid things if he pleases."

The *times* for taking food must be carefully planned, and punctuality in sick-room meals is essential; life often hangs on minutes in taking food; but it must not stand by the bed-side, or a capricious appetite will be disgusted. The *quantity* of food must be watchfully regulated; if a teacupful ordered every three hours is thrown up, try a tablespoonful every hour. The *kind* of food must be judiciously selected. Jelly is of little nutritive value: one hundred teaspoonfuls only contain one teaspoonful of gelatine. Beef-tea has a restorative power peculiar to itself, and can be relished when all other food is rejected.*

Cream is the lightest form of nourishment, and is much more easily digested than milk; but great care is needed to ensure its being perfectly sweet. Wenham Lake ice is an excellent preservative. Tea and coffee, like beef-tea, have a remarkably restorative power. Chemists have found out why. They have weighed the man, and found that the infusion of one ounce of roasted coffee daily will lessen the waste going on in his body by one-fourth. As a rule, however, tea and coffee are too exciting for the sick after 5 P.M., and interfere with sleep. Sleepiness in the morning, on the other hand, is often caused by exhaustion, and is relieved by an early cup of tea or coffee. A patient must not be talked to, or allowed to attend to anything else while at his meals: all his nervous strength will be needed for digestion.

A nurse who is true to her vocation will study the tastes and feelings, as well as the physical wants, of her patient. We do not need psychologists to prove the intimate connection between mind and body: it is patent to every-day observation. What invalid has not felt the better for a bunch of fresh flowers brought into the room? It is an exploded fable that a few flowers will deteriorate the air. A bouquet or a growing plant refresh both mind and body. You can hardly realise the weariness of constant confinement within four walls, without occupation, till you experience it. The sick should be indulged with as much variety as possible; only let it be a slow variety, which may amuse without fatigue. Invalids should be able to see out of the window, and the sunshine, with its cheering, renovating power, should not be excluded from their room. In public hospitals it has been noticed that almost all the patients lie with their faces towards the light.

A glad, pleasant face is peculiarly welcome to the sick. A cheerful word is a positive tonic. An instance occurs to us. "One of the Light Brigade, who had escaped from the Balaclava charge, long after was kicked by a horse in the chest, and sent to the Sentari Hospital. He was depressed in spirit, which prevented him from throwing off the disease engendered by the blow. The

* If the essence of beef-tea is wanted, cut a pound of raw beef into small slices, put it in a covered jar without any water, cover it and stand the jar in a saucepan of water to simmer for six hours. When you take it out you will find about a teacupful of the strongest beef-juice. For other receipts, see "Plain Words about Sickness, addressed to the Mothers and Wives of Working Men."

doctor remarked he wished the soldier could be roused, and among other remedies leeches were prescribed. While watching them I tried to enter into conversation, but received only monosyllabic replies. A copy of Tennyson's poem having been sent to me that morning, I took it out and read aloud—

“ ‘Half a league, half a league,
Half a league onward,
All in the valley of death
Rode the six hundred.
‘Forward, the Light Brigade!
Charge for the guns!’ he said.
Into the valley of death
Rode the six hundred.

“ ‘Forward, the Light Brigade!’
Was there a man dismayed?
Not though the soldiers knew
Some one had blunder’d;
Theirs not to make reply,
Theirs not to reason why,
Theirs but to do and die.’

The man at once forgot his pain, and entered into a spirited description of that terrific gallop to and from the cannon-crowned height. In a few days the invalid requested the doctor to discharge him for duty, being now in health; but, whether the cure was effected by the leeches or the poem, it is impossible to say. On giving the card, the medical man murmured, ‘Well done, Tennyson!’”*

Many fancy a nurse is only needed to spare her patient *bodily exertion*; but it is far more necessary to spare him *mental effort*. If the sick have to think for themselves, they might as well have no nurse. They must not have to remind you of their medicines, their meals, their night-light, etc., nor require to answer the same questions again and again when once would suffice. You must plan for them, remember for them, and anticipate all their wants, and all this without expatiating on what you are doing or mean to do. “A nurse ought to understand every change of her patient’s face, every change of his attitude, every change of his voice. And she ought to study them till she feels no one else understands them so well. She may make mistakes, but she is *on the way* to being a good nurse. Whereas, the nurse who never observes her patient’s countenance at all, and never expects to see any variation, any more than if she had the charge of delicate china, is on the way to nothing at all. She will never be a nurse. ‘He hates to be watched,’ is the excuse of every careless nurse. Very true. All sick people and all children hate to be ‘watched.’ But find a nurse who really understands her children and her patients, and see whether these are aware that they have been ‘watched.’ It is not the staring at a patient which tells the really observant nurse the little things she ought to know. The best observer I know, the man whose labours among lunatics have earned for him the gratitude of Europe, appears to be quite absent. He leans back in his chair with half-shut eyes, and meanwhile sees everything, hears everything, and observes everything.”†

This habit of correct observation will enable you to give a concise and serviceable report to the doctor; you can tell how many hours the invalid slept, and at what hours of the night; you will be a fair judge of how many ounces of food he swallowed; you will learn to distinguish the indication of the pulse, so valuable when rightly interpreted, so fatally delusive to a novice; and you will notice many other points on which we cannot here touch.

Yet observation alone is not sufficient, without thought and judgment, to make use of the details with which it supplies us. A nurse should be a thoughtful, responsible person; nor must her thoughtfulness benefit her patients only while she is in actual charge over them. Her own health requires that she should leave the sick-room for rest and daily fresh air, and it is during her absence that so many *accidents* (?) occur; the visitor is injudiciously admitted, the afternoon rest is broken, the medicine omitted, and the meal delayed. All this might be prevented by previous arrangement; and it is the duty of a nurse not so much to do the things which are actually required, as to know they are done. Indeed, the same principle applies to every person in charge; we should so conduct our affairs as to be able to devolve them on others when needful.

Have we sketched too high a model? Yet, less than this will not meet the wants of the suffering and helpless. For this, as for every other vocation, we must through prayer obtain a strength beyond our own. This will help us to meet patiently the irritability of nervous invalids, calmly and promptly to fulfil duties of critical importance, and to reflect Heaven’s own light to those walking in the shadow of death.

At this time, when so much is said about the employment of women, and the difficulty of procuring it, it is well to know that in the nursing department the demand far exceeds the supply, and this although ample remuneration is offered. Even probationers at St. Thomas’s Hospital are allowed a stipend during their year of training, after which, immediate employment is obtained for them, commencing at not less than £20 a year, with extras. Will not some of the women of England, then, come forward and embrace this truly womanly vocation?

INDIAN THIEVES.

COMMUNICATED BY MAJOR-GENERAL SIR THOMAS SEATON.

In that most interesting work, “Modern Egyptians,” by Lane, the translator of the “Thousand and One Nights,” I met with this paragraph:—“Even the common thieves used not many years since to respect a superior, who was called the Sheikh. He was often required to search for stolen goods and to bring offenders to justice, which he generally accomplished. It is very remarkable that the same strange system prevailed amongst the ancient Egyptians.”

I think it is equally remarkable that not many years ago—1823—a somewhat similar system prevailed in various districts in India, and may possibly prevail in a modified form to this day. The thieves in those districts were banded together under acknowledged leaders, to whom they all paid implicit obedience, and through whose influence stolen property might be recovered. But the strange feature in these Indian brotherhoods of thieves was that they and their leaders were always ready to earn an honest livelihood, and their peculiar and favourite line was that of chokeydar, or watchman. To sober-minded Englishmen it may seem a strange and most dangerous plan to employ a professed thief to watch and guard property from thieves—his own comrades, in whose company he had robbed and plundered many a time; but it is one of the many remarkable anomalies that are to be met with in that most remarkable, and still little known country. I have never known these chokeydars other than honest and faithful; the goods and chattels of any person entrusted to one of these thieves were respected by the band; his house was never robbed. Sometimes a thief, disappointed, perhaps,

* “Experiences of an English Sister of Mercy.”

† “Notes on Nursing.”

in his share of a booty, would "run rusty," and, to show his spite to his leader, would commit some small depredation on a protected house; but he could not do much, he could get no assistance, and there were too many of the fraternity on the watch.

In October 1823 I reached Cawnpore, on my way to join my regiment, and as I should be some time getting together my marching establishment, tents, horses, servants, etc.—for I had come up by the river—I hired a small bungalow. As soon as I had taken up my residence, I was waited upon by the cutwal of the chokeydars, as he was called, a respectable looking individual, well-spoken, dignified, stately, but with an eye that seemed to glance round and to catalogue and appraise everything in the room in that glance, who advised me to take a watchman whom he was prepared to supply. I did not "see the fun" of paying ten shillings a month, for (as I thought) a mere incumbrance, and I refused. Fortunately a friend came in at the moment, and told me the story of a young officer who had been recently robbed; he would not hire a chokeydar, so everything he possessed was taken out of his house, the very sheet he was lying on was taken from under him, and his sword, as a warning, was thrust through his mattress.

This clever and seemingly impossible feat was effected in the simplest and neatest way possible. The young officer was warned that his house would be robbed, the thieves knew that he would watch, but they knew also that his youth would soon succumb to the heat of the climate and the fatigue of watching, and then he would slumber most profoundly. So on the third night, as day began to dawn, and when, as anticipated, overcome by the fatigue of the two previous nights' watch, and lulled by the coolness of the morning air, in fancied security the young officer had sunk into a profound slumber, the thieves commenced operations. They had but a few minutes for their work, for daybreak was close at hand, and it dawns near the tropics as rapidly as light departs; there is very little twilight; dawn springs at once into broad daylight. To get into his room, remove all his boxes, his furniture and other things, to take the pistols from under his pillow, and gently remove the sword from his now relaxed grasp, was the work of a few minutes only, and the main body of the gang moved rapidly away, carrying off the plundered property. The leader of the gang remained with two of his men. They first drew off gently the single sheet that covered the sleeper, then they rolled up the under one until it was parallel to, and touching his back as he lay on his side. Then all left the room but the leader. Squatting on the ground close to the sleeper's head, as it hung over the pillow, he took a feather and gently tickled his nose. Thinking it was a fly, he instinctively rolled over to the other side, and when he had again settled into sleep, the rolled-up sheet was easily withdrawn. Then, thrusting the sharpened sword through the mattress, the thief walked off in triumph, following his gang, who with the stolen property had effected their retreat in safety.

This story settled the matter. The cutwal kept his promise to supply me with a good man, and before evening I was master to a hearty, jolly old fellow, called Bhowanny, who, to my great surprise and the surprise of all my friends, proved to be a Brahmin of the highest strain. How one of the purest caste came to be connected with the guild of thieves I never could understand. I thought at one time that he might be their Friar Tuck. At all events, he was the most straightforward, honest, good-tempered old fellow I ever met with. He left his old wife and family to follow me, when I left Cawnpore, and looked after me as if

I was his son. He remained in my service over eleven years—in fact, until I came home on furlough. My other servants treated him with the greatest respect, always addressing him as Maha Rajah, or great prince. This, in everyday intercourse, was shortened to Mārāj; and they constantly kissed his feet, embraced his knees, or stood before him in the attitude of supplication.

About a year and a half after I had engaged him, I found myself at Seetapore, in Oude, a place celebrated in those days for skilful and desperate thieves and dacoits. My chum and I thought that we might as well have one of the local practitioners to help Bhowanny, who, from being a stranger, and unknown, might not at first have any influence with the professionals of the district. Bhowanny knew what he was about, and went and engaged for our service the leader of all the thieves in the place, and a more wild, desperate-looking, audacious, intelligent, outspoken, civil, and obliging blackguard I never met with. He had attained to his pre-eminence in the thieves' fraternity by his numerous skilfully-planned and audacious robberies, by his thorough knowledge of the whole country, his aptitude at disguise, ability in getting intelligence, and in disposing of his plunder.

He was a perfect picture, and would have been a "joy," a small fortune, to an artist, could any have seen him as he stood before us—his head covered with rope like rolls of red muslin wound into a turban, that covered his ears and the back of his neck; his spare muscular frame stripped to the waist; his beard flowing down nearly to his breast, his long locks curled and matted together; and his keen piercing eyes glistening with excitement; while leaning upon a six-foot bow, and flourishing in his right hand half a dozen ugly-looking arrows, giving emphasis to his words, he recounted his adventures, sometimes tragical, but mostly ludicrous.

I will give an outline of one of his stories, which may amuse, though it loses half its interest for want of the man's rough language, his grand expressions, and the force derived from the gesticulations with which he acted his tale.

One day in the rainy season, Tokee—the name by which we knew him—received intelligence from a sure and trusty spy, that a well-to-do "Bunniah" grocer and Chandler in the town had several hundred rupees concealed in his shop; that the Bunniah was going out the next night to attend some merry-making in a neighbouring village, and that he would be absent all that night and part of the next day.

The man and his shop were but too well known to Tokee. He had somehow contrived to borrow a small sum of money from the Bunniah, which was constantly increased by enormous interest, by usury; or, if Tokee contrived to pay off any portion, the debt was speedily brought up again to the original amount, by some process which seemed mysterious to the unfortunate debtor. "Sahib," he said, "I was being eaten up. I paid him ten times over."

So here was an opportunity for personal revenge, to plunder the old extortioner, reimburse himself of all of which he had been defrauded, live at the old fellow's expense, and enjoy his anguish of mind at the loss of his treasure.

Towards sunset, when the great heat of the day had passed, and people were thronging the bazaar and streets, Tokee, who was determined that this *coup* should not fail for want of proper precautions, went to reconnoitre, accompanied by his second in command, a sort of Little John. Tokee charged himself with the delicate task of

reconnoitring the inside. His comrade was to examine the outside of the shop, and all connected with it.

The shop was of the kind common throughout India and the East, generally a square room of a convenient size built on to the dwelling-house, with which it communicated by a low strong door. The front of the room was open towards the street, but closed at night by strong sliding shutters. This contained the bulk of his goods, and was the shop proper. Outside this was a broad verandah, with a floor raised eighteen inches above the street. On this floor was placed a stand, on which were vessels of various sizes, containing convenient quantities of the article to be sold; and here the Bunniah sat, and his customers came to buy and sell, and haggle over their pennyworths.

Whilst Little John scanned the walls and doors of shop and house, and examined the neighbouring walls and houses, Tokee, who had put some money in his girdle, watched his opportunity, and when no other customer was there, and the Bunniah had gone into the inner or shop proper, he boldly entered after him, and plumped himself down on the floor. Startled by this sudden and unceremonious entrance, the Bunniah hastily snatched up an old sack, and threw it over something, which Tokee instinctively divined was the hiding-place of the treasure. To avoid suspicion, he immediately diverted the Bunniah's attention by talking about his debt, and tendering payment of a portion; then, purposely taxing him with usury and fraud, he drove the old fellow into a fury, and when the tempest of altercation, mingled with volleys of abuse, "waxed fast and furious," Tokee, who was cool and collected, had ample time to take an accurate survey of everything in the shop, the position of the sacks, the shelves, the shutters, stands, and such like, and calculate the chances of a successful attack. Having found out all he desired, Tokee calmed the Bunniah by seeming to be convinced; then, paying the money he had brought, he left the shop, and, parting on good terms with the Bunniah, he went to meet his confederate.

On comparing notes, Tokee instantly decided to attack the shop by breaking through the wall from the lane: the discoveries of his confederate seemed to render this mode of attack both safe and certain. The wall of the shop was built of *kutchā puckā*, that is, of kiln-burnt bricks laid in mud plaster; and, of all kinds of wall, this is the easiest to break through.

It may be as well to explain that in India there are several modes or kinds of building: the first is *puckā*, that is, with kiln-burnt bricks laid in lime-mortar; the next is, *kutchā puckā*, kiln-burnt bricks, laid with tempered clay instead of mortar; then *kutchā*, or sun-dried bricks laid on tempered clay; and lastly, walls built of tempered clay, like what is called *cob* in Devonshire. It may be well imagined that there cannot be much cohesion between kiln-burnt bricks and the tempered clay used instead of mortar, and that of these several kinds of building it is most easy to break through.

The shop stood at the corner of a lane leading down to the river, which was in flood at the time. Half-way down the lane was a narrow winding gully, that led to the bridge, most convenient for advance or retreat. A small stock of firewood had been laid in the lane against the wall of the shop, in such a manner as to form a snug dark corner against the centre of the wall of the shop, as if on purpose to favour the intended attack, by securing the actors from prying eyes of chance passengers going down the main street.

But to counterbalance these great advantages, the

position of the shop, the dark gully, the screen of firewood, and the nature of the walls, were several serious disadvantages: the nights were moonlight, and the moon would not set till late, thus contracting the time for their operations; then the Cutwallee (police station) was within two hundred paces; the district watchman was close by, and the door of the courtyard of the Bunniah's dwelling-house opened into the lane a few feet beyond the stack of wood. This was most awkward. The near vicinity of the police station, or of the district watchman, Tokee cared little about: the latter could easily be provided for; and in respect to the former, "You know, Sahib," he said, "the old proverb, *Cheragh ke neechē undeyāra*—there is a shadow below the lamp—the police would not think of looking for a robbery just under their noses." But the door of the courtyard opening into the lane, so near the place of attack, was the real danger; for on any alarm whilst they were at work, the enemy might sally out and take them in flank, or if they happened to be in the shop at the time, they would be caught in a regular trap. But nothing venture nothing have; the prize in view was too great, and the desire for revenge for the Bunniah's extortion too strong to be foregone, and as the dangers were all in the way of business, and rather a pleasurable excitement, the attack was decided upon without the least hesitation.

Next day the shop was narrowly watched, and every move of the Bunniah and his people duly reported to the two principals by some of the gang. As night came on the shop was closed, and the Bunniah went off to his engagement; the sky became overcast with heavy clouds, the people disappeared from the streets one by one; the shops were closed; lights were extinguished; all sounds died away except the occasional warning cry of the watchmen, the barking here and there of a dog, or the wailing howl of the jackalls, and sleep settled down on the weary inhabitants.

As the night advanced, and the moon went down, the clouds grew heavier; a soft, drizzling rain came on. Chokeydars, men, dogs, and jackals took shelter from it, and then all was silence. Presently four or five figures, wrapped in black blankets, entered the town; three went off in different directions towards the Cutwallee (police station), and up and down the street; and two, divested of all superfluous clothes, stopped in a dark place, took off their blankets, oiled their bodies, and, resuming their blankets, advanced towards the Bunniah's shop, and squatted themselves in the dark corner formed by the stack of wood.

The confederates had effectually provided against interruption from the distant chokeydar, by sending one of the gang, an amusing, chattering fellow, to engage him in a gossip over sundry pipes of good tobacco—temptations that no native of India can withstand; and of course the chokeydar was to be intoxicated by a little *bhāng* mixed with the tobacco.

Secured by the weather, and the manœuvre of their comrade, from all immediate fear of interruption, the confederates set to work. To get out the first brick was one great difficulty; no blow could be struck by any instrument: it would ring through the wall and inevitably rouse the sleepers. But these skilful operators picked the clay-mortar out with tools made for the purpose, and without much delay got the brick out. The others followed closely. The bricks were of the old Indian pattern, five inches square, one-and-a-half inch thick. After getting out a few, it became necessary to exercise the utmost judgment and caution to ascertain which was the inside layer of bricks, and to get out the first without letting it fall into the shop; this was successfully

done. As the hole every moment was made larger, more and more care was required to prevent materials falling inwards and making a noise. All went on prosperously and silently until the hole was large enough to admit a man's head, when a brick fell into the shop with a dull, heavy thump on the earthen floor, and at that very moment their scout in the main street signalled that some one was coming.

The confederates shrank into the dark corner formed by the pile of wood. Cowering down under their black blankets, they held their breath, listening for sounds from the inmates who might have been disturbed, and for the footsteps of the belated person. Slowly the passenger came along, pace by pace; then, turning down the lane, and passing within two feet of the crouching men, he paused as if he saw something. Their hearts beat wildly, and Tokee's comrade was about to spring up and rush away; but Tokee seized him by the arm and forced him to keep his place. Then the drizzle, which had almost ceased, began to come on thicker, and the man moved slowly away.

As soon as he was out of hearing, they listened intently at the hole to ascertain if any of the inmates had been disturbed. All was quiet. The work was resumed with increased vigour, and in a short time a breach was made large enough to enable a man to creep in freely. Putting his head and shoulders through the breach, Tokee listened intently for any sound that would indicate the vicinity of an inmate—any one sleeping in the shop or stirring in the house. All was silent, and the confederates crept in and groped about, Tokee to find the hiding-place of the treasure, his comrade to help, or find anything of value. The hiding-place of the treasure was soon found, the bags piled over it moved away; then, with some difficulty and care, to avoid noise, the box containing the treasure was forced open, and they got possession of the bag.

Again their faithful scout in the main street gave the signal; but this time the house was stirring, for day-break was close at hand. Quick as thought, Tokee made a dart at the hole, and got out into the lane, grasping the bag of rupees. His confederate, following at his heels, was equally quick, but not equally lucky; for, in the hurry of getting through the breach, Tokee's foot caught in a string that hung from a shelf above, and, in the struggle to free himself, he brought down on the head of his follower a large round earthen pot, that proved to be full of treacle, and felled him to the ground.

"Bāp ré bāp!"—oh dear, oh dear! called out the man, in his surprise; but in an instant he was up again, struggling to get out through the hole. Half of the broken pot, however, stuck on his head, and the treacle, streaming down, filled his eyes and half stupified him.

The crash of the pot and the man's involuntary exclamation roused the Bunniah's family; some rushed into the shop, others into the courtyard, and one stout old lady ran into the lane, all screaming at the top of their voices, "Chor, chor"—thieves, thieves—"Dawro,* dawro"—help, help—"Dhakoo, dhakoo, dacoits, dacoits." The neighbours, roused by the well-known cry, took it up, and the police, who were on the move, came running up from the Cutwallee, calling out "Māro, māro"—kill, kill—"Pukrō, pukrō"—seize them, seize them. Just as they reached the corner of the lane the unfortunate thief had staggered out of the hole with the instinct of self-preservation, had thrown off the broken pot, had drawn his hand across his eyes to clear away

the treacle, and dashed down the lane. Coming full butt against the stout old lady, he knocked her down and fell over her. Up he jumped, and off again, running for dear life, for the police were within a few yards of him; but the fall of the old woman saved him. On being knocked over, she fell on something hard, and, being terribly frightened and much hurt, and feeling herself covered with something wet, which she thought was blood, she believed herself to be wounded, and groaned out, "I'm killed, I'm killed." The foremost policeman stopped a moment to see if a murder had been committed, and this gave the fugitive some yards start. Running and staggering on, he missed the narrow gully (fortunately), blundered on to the end of the lane, stumbled over a heap of rubbish, and went souse into the river. This washed the treacle out of his eyes, and he struck out boldly for the other bank, but with much noise, for he was a poor swimmer.

In the meantime Tokee, who on the first alarm had darted off like an arrow, fled down the gully, and threaded its various windings with the silence and speed of a night hawk; but as he emerged from the lane and got to the bridge head, he was suddenly confronted by three chokeydars. Believing that his comrade was close at hand to second him, he instantly dashed at the three. The right-hand man was knocked down and hurled several paces away, but the others, though staggered, seized hold of him, one by the blanket, which was hanging loose from his head and shoulders, the other seized by the arm; and now the precaution of oiling his body stood him in good stead. Struggling on, he abandoned his blanket to the man who had seized it, and, giving himself a sudden wrench, he twisted easily out of the hands of the other, who had no firm hold on account of his greasy skin. Then, bounding forward, he crossed the bridge, the chokeydars in full cry after him, leaped the low wall at the end of the bridge, and dived at once into a perfect rabbit-warren of mud huts close at hand, the resort of himself and gang, and he was safe, for the chokeydars dared not follow him. Hiding his plunder, and putting on some clothes, and taking another blanket, he went boldly on to the bridge, and calmly listened to the uproar in the town.

When his less fortunate comrade fell into the river and swam towards the opposite shore, some of the police came up armed with matchlocks, and, directed by the noise he made, began to fire at him. Tokee instantly guessing that his comrade was swimming the river, ran swiftly and silently to a bend in the stream, gave the signal to his follower, and, reaching out, he soon caught him by the hand and got him ashore. Then, making a wide circuit, to avoid the police, they reached their haunt in safety, and on examining their booty found that they had got nearly six hundred rupees.

Of course, Tokee did not fail to visit the old extortioner next day and enjoy his despair, whilst he lectured him on the folly of keeping so much money in such an insecure place. It was tempting, he said, all the rascals in the country to try and rob him; and on being shown the breach made in the wall, he quietly remarked, that it must have been done by a pukka chōr (a skilful thief), and an impudent fellow, to attack a house so near the police-station.

BEE-BATTLES.

AFTER reading "The Battle of the Bees" in No. 840 of "The Leisure Hour," I waited to see if any bee-masters could afford to the writer trustworthy information on

* Dawro means run; but, as used here, it means "run and help us."

the subject of his very interesting paper. Having made the habits of the honey-bee a careful study for many years, I offer the following observations.

That the uninitiated may be the better able to judge of the extent and consequences of these occasional wars called bee-battles, be it known that each community of bees consists of one queen, from 500 to 1,500 drones, and from 10,000 to 30,000 working bees. The drones,

"Those lazy fathers of the industrious hive,"

are allowed to enjoy their life of ease and pleasure but for a few months—generally from May to July, sometimes from April to August.

In the contests between the drones and workers the fighting is all on one side. This we pass over for the present, only observing that the hive is placed in a better position by the contention.

A battle between the workers of different communities is a much more serious affair. Bee-fights generally originate in those persistent attempts to rob, which are to a greater or less degree indulged in at various times, but mostly in the autumn. In the richer part of the honey-season, if the weather is very hot, the strong odour of pollen and honey attracts the bees recently hatched, so that, instead of following the older ones into the fields, they enter the fragrant domiciles of their neighbours, and many fall a sacrifice to this indulgence of their natural instincts. But newly-hatched bees are not the only robbers. Bees, though proverbially industrious, will always save themselves labour when they can, and help themselves to honey when it can be had. A swarm of bees sometimes enters a hive already occupied, causing serious strife. Queens never take part in these desperate struggles, commonly called bee-battles. Bees have many enemies; but the inhabitant of the adjoining hive is the one most to be dreaded. Strong, or at least well-to-do hives, are as a rule the aggressors, and weak hives, especially queenless ones, are the first victims. When weak hives are overpowered and robbed, the marauders seek other prey, and occasionally the most disastrous consequences follow.

When bees are about to swarm, certain scouts select a place suitable for a new home, and it often happens that the neighbouring hives are examined for this purpose. This leads to quarrelling, and to some loss of life, but never to a bee-battle. Such loss may in some degree be prevented by keeping near the apiary a hive or two, with a little comb in position.

After a battle the defeated hive is always robbed; indeed, the robbery goes on during the fight, and the few remaining bees (if any) are dispersed—mostly, perhaps, in their search for food.

Some years ago, at Newtown, a hamlet belonging to this parish (Tisbury, Wilts), two stocks of bees, the property of cottagers, occupied each its own garden, the highway lying between. At the close of the honey season one hive attacked the other with such violence, that, after several days' hard fighting, the whole population of one of the hives was destroyed, and the fruits of the summer's industry transferred to the stronghold of the invaders. I had not the opportunity of ascertaining the origin of this battle, but have not the slightest doubt but that it began in the usual way, by a raid in search of plunder.

In my own garden, where I have had from thirty to sixty hives, I have frequently prevented a serious fight by contracting or closing the doorways of the hives. Upon one occasion the strife had assumed such serious proportions that I was obliged to remove the invaded

hive to a distant part of the garden. Even this did not suffice, probably on account of a few of the invaders being left in the hive. I then took the stock about five hundred yards from the scene of conflict. This succeeded, and in a few days the bees went to work as if nothing had happened, although during the fray they had lost many bees, and some pounds of honey. It is a difficult matter to separate the belligerents after a fight has fairly commenced, because in their exasperation they continue the strife long after working-time.

Within the limits of this parish is a farm called Withyslade, the property of Lord Arundell of Wardour. The dwelling-house is situated about a quarter of a mile from any other residence. Many years ago the occupier of this farm lost a mare when her foal was in a helpless condition. It was taken and "brought up by hand," and thrived in a most satisfactory manner. As was likely under the circumstances, it became quite the pet of the family, and was allowed to go in doors with the freedom, if not the frequency, of a lap-dog. When it had grown quite a nice colt it found its way into the garden and upset a stock of bees. The infuriated insects attacked the poor animal with such fury that after a short time he died in extreme agony.

Some years afterwards, this same garden was the scene of one of the most determined and disastrous bee-battles perhaps ever recorded. The farm had passed into other hands, a new house had been built, and an apiary erected at right-angles with the house, and close to it. In the spring (I forget the year), four or five communities occupied the apiary. My aunt (the bee-mistress), considering her bee-house too much exposed to the wind, placed all the swarms of the season out of doors, in the usual single-pedestal cottage style. Five or six swarms came off during the summer, and were placed just outside the apiary, and in a line with the front of the farm-house.

At the usual time for freebooting, a serious disturbance amongst the hives took place. Very soon the strife had become alarming, and my aunt concluded that some mysterious cause of quarrel between the old hives and swarms had arisen. From this time to the end of the conflict the battle raged so furiously that no person dared do more than look on from a respectful distance, and, with regretful amazement, let the thing take its course.

My aunt's suspicions as to the combatants were not verified. Whilst this fierce war was raging, something equally enigmatical was taking place in the garden of a cottager living about a quarter of a mile distant. He kept a number of bees, and was not a little astonished to find them in the early part of the day leaving their homes in the most excited manner, as if some half-dozen swarms were coming off at the same time. The bees were evidently intent upon something that engaged all their energies, and that was not in the line of common bee-work. This was the invading host, so skilfully marshalled, and that seemed to understand the cause of the uproar. Off to the seat of war in "double quick time" seemed to be the order of the day. Day after day was this terrible conflict continued, till every hive of my aunt's was destroyed, and every cell rifled of its treasure.

It would be quite useless to attempt a description of the scene of desolation that appeared after this fierce battle; it can be more easily imagined.

It seems somewhat ungrateful to our industrious and useful little friends thus to hold them up as quarrelsome neighbours; but I hope to make them some amends by adding, in a future paper, a few facts relating to their "love and labour."

J. B.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

A TROUBLESOME MISSIVE FOR SQUIRE FOLEY.

THE MORTONS OF MORTON HALL.

CHAPTER XXXVI.—IN WHICH SQUIRE FOLEY, OF BRIER HALL, RECEIVES AN ANONYMOUS LETTER.

WHILE the various events recorded in the several preceding chapters of this history were transpiring at St. David and elsewhere, nothing of importance had occurred to disturb the even tenour of the way of the inmates of Brier Hall.

As I have heretofore stated, Mr. Foley, in his sudden affright upon hearing of the mysterious visit of the stranger to Fordham, had caused some inquiries to be

instituted after his former ward, Mary Morton, of whom he had heard nothing since a year or two after her marriage with Lieutenant Talbot. These inquiries, however, not very earnestly pursued, had resulted in failure; and, hearing nothing more of the stranger, who had come and gone, and left no sign, the squire had settled down to his former quiet routine of life. Though he was still looked shyly upon by his brother county magnates, he consoled himself with the reflection that, let them be as distant as they pleased, he was still lord of the manor of Fordham, and the wealthiest commoner, and one of the largest landowners, in the county.

One morning, however, about the same date as that to which the preceding chapter relates, Squire Foley, on unlocking the letter-bag, which had been placed on the breakfast-table, as usual, by the footman, drew thence, among other correspondence, a strange-looking, square-folded letter, fastened with a wafer, which had evidently been impressed by a large and dirty coarse-grained thumb. This odd-looking epistle was directed in a large, schoolboy hand, to

"Mister Squire Foley, with speed,

"at brier Hall, near by fordham,

"B—shire, England."

"What's this? What's this?" cried the squire, irritably, as, with a look of intense disgust, he held the queer-looking letter daintily between his finger and thumb, and glanced at the postmark through his gold-rimmed double eye-glass.

"Falmouth, Cornwall!" he went on. "I've no correspondents in Cornwall. And, I declare, thirteen pence postage! Here, you Thomas!"

Squire Foley, like most people, rich or poor, before the era of cheap, uniform postage, had a mortal aversion to paying the high rates that were charged in those days; and, turning angrily to the footman, who appeared at his summons, he growled—

"You tell Jackson (the groom) that the next time he dares to take an unpaid letter from the post-office, unless he knows the writing to be that of some one of my regular correspondents, I'll stop the amount out of his wages. People who don't pay their postage would as soon as not pick a pocket.

He seemed half inclined to throw the letter into the fire. "Some begging epistle, I warrant," he muttered to himself. "Or some rascal of a servant whom I've discharged at some time or another writing for a character. He'll get one with a vengeance!"

Upon second thoughts, however, though with an expression of disgust upon his features, he tore the letter open, and glanced disdainfully at its contents. But his attention became immediately so absorbed in what he was reading, that his daughter, who was seated at the breakfast-table, said, with a smile—

"At all events, papa, the letter seems deeply to interest you."

"Eh, what?" cried the squire. "Interest me! I can hardly make out the dirty, ill-spelt scrawl."

"Perhaps I can assist you in deciphering it, papa."

"Perhaps you can attend to your own business, miss, and not interrupt *me*," growled the squire; and, thrusting the letter, which but a moment before he would scarcely deign to touch, into his pocket, he commenced breakfast, without even looking at the remaining letters in the bag. He seemed, however, to have lost his usual good appetite; and, the moment the meal was ended, he retired to his study.

"I'm sure papa's dreadfully annoyed by something in that odd-looking letter, mamma," said Miss Foley, as soon as her father had retired.

"Something about the elections, I daresay, my love," replied Mrs. Foley. "I'm sure, when I was a girl, and your grandpa stood for the county, he used to get letters from all sorts of vulgar people, asking for favours of one kind or another, and sometimes he was very much annoyed. I often wonder why gentlemen care to get into Parliament. I'm sure it costs a great deal of money, and causes terrible disappointments. Think of your brother William, when we all went up to London to hear him make his first speech, and they laughed at him so much, poor fellow, and your papa lost thousands of pounds."

"Nay, mamma," interrupted the young lady, "it surely cannot be that which annoys papa. William, I've heard, hasn't a chance to gain the next election, and I should think he and papa too have had enough of Parliament. That letter's nothing to do with the election. It comes from Cornwall, a hundred miles from any part of our country. I *should* like to know what it contains to vex papa so, though. It quiet spoilt his breakfast."

Mr. Foley, however, did not choose to enlighten his daughter, nor any member of his family, as to the contents of the epistle in question.

Immediately upon reaching his study, he perused the scrawl again and again, and then sat down and penned a letter to his lawyer, requesting that gentleman to favour him with a visit immediately, as he wished to consult with him upon a matter of possibly great importance.

"In fact," he went on to write, "I have received an anonymous letter, which may be but a scheme to extort money, and *may* have some meaning in it. The writer—vulgar wretch as he evidently is—has obtained some knowledge of my family affairs; and though I was at first inclined to burn the vile epistle, I have subsequently thought it better to advise with you.

"Come down immediately. I shall look for you to-morrow night. You will find a bed at the Hall.

"Yours truly,

"WILLIAM FOLEY.

"Edward Ferret, Esq.,

"Furnival's Inn, London."

The missive which had caused Squire Foley so much annoyance ran as follows—the writer having generally dispensed with points and capitals:—

"Falmouth Cornwall

[no date.]

"HONNERED SIR,—i have in a way wich i don't need to explane got a paper wich I have kep carful a good wile thinkin it were of no use till on consultin' a frend who knows the lor he say it is of grate importance to Squire Foley and none others, but one as mite bring you to rune by takin the estates of Brier Hall to them as is the true hares—honnered sir to pruve my words I say that the tru hare which has a family his name is Morton by rites, and he is living as was thort to be drownd forty years ago my Frende say without the paper the tru hare is nothing, wich seeing the estates is yourn so many years will be only rite and fair to you honnerd sir.

"I am only a pore man or I would give the paper for nowt, but what is nowt to you honnerd sir is to me a fortun so please sir *rite immedyet* else I shall think you don't care for the paper wich I shall send to the tru hare wich will be *thankful* and *grateful* for sich luck, and no doubt willin to *pay handsome*.

"Dreck to A.B. post-office Falmouth, Cornwall—lef till called for—statin what you are willin to pay et setterer.

"Don't try to seke out the riter wich will lead to me sendin' the paper dreck to the lost hare wich is livin. So no more at present from your honnerd sir to command—A.B."

CHAPTER XXXVII.—IN WHICH SQUIRE FOLEY CONSULTS WITH HIS LAWYER.

ON the third morning after the receipt of the ill-spelt scrawl which had caused him so much inquietude, Mr. Foley was seated in his study in earnest conversation with his lawyer, Mr. Ferret, a small keen-visaged, though mild-spoken gentleman-like man, exceedingly neat and

prim in his attire, whose professional avocations were largely directed to the investigation of disputed claims to title-deeds and other property.

Though a sharp practitioner, and a man who considered it to be his duty to devote his subtle intellect and restless energy to the interests of those who engaged his services, Mr. Ferret was an honourable man in his way, and one who would not willingly assist to further any dishonourable or dishonest transactions. He was a very different man from the lawyer who had been one of the joint guardians of Mary Morton, and who had aided to deprive his ward of the small fortune which she ought to have received on the day when she attained her legal majority. That individual had been many years dead, and Mr. Ferret had succeeded him in the management of Mr. Foley's affairs. He, however, was ignorant of the family history of the Mortons, and of the manner in which the present proprietor of the Morton Hall estates had inherited the property.

"What was the age of this Henry Morton at the date of his disappearance and supposed death?" he inquired, after he had read the letter, and Mr. Foley had acquainted him with certain facts, of which he had had hitherto but a partial knowledge.

"About fourteen years, I should say."

"And you are sure that no authentic report of his death was ever received by his friends?"

"His death was taken for granted after the lapse of several years, during which nothing was ever heard of or from him."

"He was, you say, a midshipman in the navy?"

"A midshipman on board the Lurcher sloop of war, some forty years ago. The vessel was attacked and sunk in the British Channel, only two days after she sailed from Portsmouth, by a French frigate. All the officers and crew were killed or drowned, except two or three seamen, who were rescued by the Frenchmen's boats, and confined as prisoners of war at Montauban. These seamen managed to escape in course of time, but nothing more was heard of them. It was said that there was a boy among them, but he was believed to have been one of the ordinary ship-boys. Every possible inquiry and search was made after young Morton, by his father and elder brothers, in vain; and when, a few years later, there was a short term of peace, and the youth neither returned home nor wrote to his friends, they, of course, gave him up as dead."

"Still, my dear sir, there appears to have been no proof of the boy's death; and in my experience I have known quite as strange instances of return after long absence."

"Have any of the people of the village or neighbourhood got any relatives or friends at sea?" inquired the lawyer, after a brief pause.

"Not that I am aware of," replied Mr. Foley.

"I ask," continued the lawyer, "because it has struck me as being possible that this letter comes from some sailor who has acquired some knowledge of your family affairs, and hopes to profit by means of that knowledge. Such a man might have been one of the crew of the sloop of war who were picked up by the Frenchmen. He might, by some means, have become possessed of some letters or documents which belonged to young Morton, and which he might have retained until now, and until—as the letter seems to infer—some wily associate has put him up to this scheme to extort money."

"Then you do not really believe that Henry Morton is still living?" said Mr. Foley, his face brightening at the idea.

"I neither credit nor discredit it. It is very possible—still, it is not probable. Had the boy been of humble parentage it would appear more probable; but a youth in Henry Morton's position would, one would imagine, have returned to his friends at his earliest opportunity, particularly if he heard—as one would suppose he must have heard—of the death of his elder brothers, and his own consequent heritage to the estates. Still, as I have said, it is possible that he is living. There is no accounting for men's vagaries."

"And if he should be living?"

"In that case, my dear sir, if he can prove his identity, as I should think he could easily do, he is, by your own showing, the present proprietor of the Morton Hall property; and, what is more, he could claim the back rents for a term of years, which, allowing the annual rental to be ten thousand pounds, would amount to the large sum of sixty thousand pounds!"

"It is shameful!" exclaimed Mr. Foley. "There ought to be a statute of limitation."

"There is, my dear sir. Six years, I believe——"

"I mean, sir," interrupted Mr. Foley, "a statute of limitation disallowing even any claim to possession after the lapse of a reasonable number of years. As to the claim to back rents, it might as well be made for sixty as for six years, so far as my ability to meet either demand is concerned. 'Is it just that I and my family may be deprived of property which has been for thirty years in our own undisputed possession?'"

"If you, my dear sir, were the claimant in such a case," replied the lawyer, with a quiet smile, "I suspect that you would think it very hard, and very unjust, if, because through error or mischance of any kind, some other person had become possessed of property that was rightfully yours, and had held that property for a term of years, the law of the land forbade you to claim your rights? I think, however, that you are disquieting yourself without adequate cause. I believe the letter to be merely the clumsy expedient of some, evidently ignorant, uneducated individual, who has some knowledge of your family history, to extort money from you. There is no proof that Henry Morton is still living. The letter does not purport to come from himself. Nay, more, the writer infers that though the rightful heir is living, he has no knowledge that he is the real owner of the Morton Hall estates. Not a very likely thing, I should imagine, under any circumstances in which Henry Morton—if he be still living—may be placed."

"You would advise me, then, to take no notice of this anonymous epistle?" said Mr. Foley.

"Nay, I do not say that," returned the lawyer. "I should advise that you answer the letter, if only that you may discover the writer, and learn if there be really any truth in his statements. Of course send no money—make no bargain. I'll tell you what I think the best plan. I will, if you think proper, go myself immediately to Falmouth. Meanwhile write to this A. B. at the post-office, to the effect that you care very little about the matter of which he has written, though, as he appears to be actuated by good feeling towards yourself, you are willing to grant him a personal interview—of course promising the utmost secrecy. I will watch the post-office narrowly, and find out who calls for the letter. Whoever it may be, I will track him to his home, without making myself known to him. If he consent to a personal interview, I will, in your name, or on your behalf, await his appearance at whatever place we may decide upon. If he do not call—which I think most probable—I shall know where to lay hands upon him,

and I warrant you that I frighten him into giving me all the information he *may* possibly be possessed of, or into a confession that he is an impostor. I shall be guided by circumstances how to act, and I think you are satisfied that your interests will not suffer in my hands."

To this arrangement Mr. Foley gave his ready consent. He wrote, from the lawyer's dictation, to his anonymous correspondent, requesting A. B. to call at a certain hotel (designated) whereat he would meet a confidential friend of his (Mr. Foley's), to whom he might safely communicate whatsoever he had to disclose, and who would then judge of the value of the information he received.

This letter Mr. Ferret posted himself, and that evening quitted Morton Hall for London, and immediately upon his arrival at the metropolis set out for Falmouth.

CHAPTER XXXVIII.—MR. FERRET MAKES SOME STARTLING DISCOVERIES.

A FEW days later Mr. Foley received a letter from Mr. Ferret, written in friendly more than professional strain:—

"Golden Lion Hotel,

"Falmouth, Cornwall,

"Friday, Aug. 10th, 18—.

"My dear Sir,—I arrived at Falmouth on Tuesday, noon, and immediately engaged a room at the hotel above mentioned, from the window of which I can obtain a view of all that passes in the vicinity of the post-office, nearly opposite; and after I had secured the room, I stepped over to the office and inquired of the postmaster whether he had received a letter directed to 'A. B. till called for?'"

"Such a letter," he replied, had that moment arrived—as I expected to hear, since I travelled myself by the mail-coach. He was about to hand me the letter, thinking that I was the person to whom it was addressed; but I, of course, undeceived him. I, however, informed him that, for certain reasons, I wished to see the person who would call for it, and begged him to take particular notice of the said individual, in order that he might, should A. B. prove to be, as I suspected, a native or resident of Falmouth, perhaps be able to acquaint me with his true name and occupation.

"To this the postmaster agreed—taking me, I suspect, to be a detective officer. Scarcely, however, had we made this arrangement ere the individual in question entered the office, and, as I fancied, somewhat to the astonishment of the postmaster, he proved to be a respectable looking man, dressed in the garb of a gentleman's groom.

"What, Thomas!" cried the postmaster, who was evidently acquainted with the man, at the same time casting a side glance at me, 'how comes it that you have your letters directed to "A. B.?" Are you ashamed of your own name?'"

"No, Mr. Jarvis," replied the fellow. 'I h'a'nt no call to be ashamed o' my name; but this here be a little matter o' bis'niss as I wants to keep secret awhile;' and with this he put the letter in his pocket and walked away.

"You know that man?" said I to the postmaster.

"I know him well, sir," was the reply. 'I should hardly think he'd be up to do anything off the square, though there's no saying. If he have been, however, you can find him at any time; for he lives as servant with a gentleman at St. David, a few miles distant.'

"What is his name besides Thomas?" I asked.

"Thomas Dickson, sir," replied the postmaster. 'He used to live in the town, as his father and grand-

father did before him, until he went to live servant to the gentleman I spoke of.'

"I then told the postmaster that he was mistaken in imagining that I suspected the man of wrong-doing, and that I merely wanted to discover who he was, in consequence of his having written an anonymous letter to a friend of mine.

"I learnt furthermore from the postmaster that this man, whose father was a mechanic employed in the dockyard, had been for several months in the service of a gentleman of fortune whom he (the postmaster) believed to be an American, or at least to have lived a great many years in America, and who had settled at the village of St. David, some twelve or fourteen miles distant.

"When I inquired the name of this gentleman, however, the postmaster hesitated in, I thought, a singular manner, and then replied that the gentleman's name was Aston. He furthermore stated that the servant, Thomas Dickson, was, he had understood, thinking of quitting service, and taking the lease and goodwill of a public-house situated near the quay, and much frequented by sailors. He added that the present landlord of the public-house, or 'public,' as they say here, was growing old, and was about to retire with a comfortable independence; and when I hinted that Thomas Dickson had been fortunate in saving sufficient money in service to purchase the lease of such a house, he replied that he and many others wondered how that was. Some thought his master had promised to set him up in business; others, that he had come into a legacy; but, be that how it might, he had offered to pay down two hundred pounds cash for the lease and goodwill of the house.

"There was something in this information, coupled with Mr. Dickson's letter to you, and the fact that he was living as groom with a gentleman who had been many years living in America (for I did not believe in his being an American by *birth*, who had left his own country to reside in England), that struck me as singular, and I resolved to take a trip to St. David, and, if possible, learn something further respecting Mr. Dickson and his master. So I set out for the village the next morning early—strangely enough, Thomas Dickson, who had remained in Falmouth all night, returning to his home in the same conveyance with me, though, as I was inside the coach, and he outside, we had no communication with each other; nor do I think he had any notion that the stranger he had met at the post-office at Falmouth was his fellow-traveller.

"I must now prepare you for unpleasant intelligence.

"On my arrival at the village, I put up at the only house of entertainment in the place—a small but very comfortable little tavern, called the Fisherman's Arms, and kept by the widow Bolitho, a chatty, pleasant-looking and pleasant-spoken little woman, who only wanted priming to let out everything she knew about her neighbours of every degree.

"From her I learnt that this Mr. Aston is an English gentleman, who has been abroad since his boyhood—a period of forty years; that he was shipwrecked off the coast, on his passage from America, somewhat more than a year since; that, after his shipwreck, he was for some months the guest of the rector of the parish; then he went away, and returned in the course of a few months, and took up his residence in a villa called Cliff Cottage.

"This was not all the information I obtained from the gossiping little widow. I learnt that Mr. Aston had come to England to seek out some of the relatives he

had neither seen nor heard of since his boyhood, and that he had failed in his endeavour, when he returned, in a state of ill-health, to the village. After his return, however, he, strangely enough, discovered in the young woman who occupies the position of governess over the village schools the daughter of the sister whom he had sought in vain; and, though he kept his discovery a secret for some time, he lately acknowledged himself to be her uncle.

"The name of this young lady (who, by the way, had a brother who is supposed to have been lost at sea) is Mary Talbot, and there exists not the slightest doubt in my mind that she is the daughter of the young lady—once your ward—who, as you informed me the other day, married one Lieutenant Talbot, of the Royal Navy.

"The inference to be drawn from this is plain enough, though you will say, 'How can it be that her long-lost uncle's name is Aston?'

"I reply that Aston is an assumed name, adopted, I have no doubt, for purposes of secrecy, when he first returned to England. It is now pretty generally known in the village that his real name is Morton—*Henry Morton*—though he is still spoken of as Mr. Aston by the people who first knew him by that name, and I suspect he still wishes his real name to be kept secret, for reasons of his own, which you, as well as I, will readily divine.

"Why he has not heretofore made known his return to you, I cannot say, though I have no doubt that he was the stranger whom you spoke of as having visited Fordham, and made so many strange inquiries during your absence in London.

"Now comes the question. Was he the writer of the anonymous letter taken by his servant from the post-office?

"I reply, most certainly not. I believe the servant himself to be the writer; and here hangs a mystery, which, though I cannot yet fathom it, I can partially see into.

"Some months ago, I learn, Mr. Aston, or Morton, was robbed of a pocket-book, which contained a large sum of money and certain important papers. Some of the fishermen of the village were suspected of the theft; subsequently, suspicion was removed from them, and it was even hinted that the young man who is supposed to have perished at sea was concerned in the matter; and, though this again was denied, the thief has never yet been discovered. I, however, have my suspicions that Mr. Thomas Dickson was the thief, and that he, foolish fellow, will, through his greed to obtain more money for the papers of which he writes, bring the crime home to himself.

"While I was chatting with the widow Bolitho, an old wooden-legged sailor, named Jemmy Tapley, dropped in, and took part in the conversation. A shrewd old fellow he appears to be; and when I—inadvertently, I own—mentioned that I had heard from the postmaster at Falmouth that Thomas Dickson was negotiating for the purchase of the lease of a public-house in that town, I saw by the look of the old man, that he had no very good opinion of Master Dickson.

"You will perhaps ask how I, under the circumstances, would advise you to act. I cannot yet advise one way or another. I must see you again, and we must talk the matter over more fully.

"I cannot understand why this *soi-disant* Mr. Aston, if he be the veritable Henry Morton—as I have little doubt that he is—has not yet seen fit to put forward his claims to his father's estates. He is a rich man, and may not care to disturb your possession; but that is very

improbable. I should rather suspect that he is biding his time for some purpose of his own.

"He *may* not be, after all, the Henry Morton whose return you have so much reason to dread; but I fear that you must not build your hopes upon that.

"Of this you may be assured, that if he really be the youngest son of the late Edward Morton, he will be able, beyond a doubt, to establish his identity whensoever he thinks proper to do so. Possession is a great advantage, and if a generation or two had elapsed since the disappearance of the direct heir; if some descendant of the direct heir were to advance his claims, there *might* be some chance of your successfully contesting them. Against Henry Morton himself, success would be out of the question. He is not yet an old man, and there must be many persons living who are able to identify him.

"However, I will say nothing more at present. As I have said, we must talk the matter over—though I may say, that if, after further inquiry, we feel perfectly satisfied that he is the real Simon Pure, it would be, in my opinion, most advisable for you not to await the putting forward of his claims, but immediately, and—as it will then appear—generously, to come forward yourself, and inform him that you have heard of the return of the direct heir to the Morton Hall estates, whom you have supposed to be many years dead; that you acknowledge his claim, and are ready to resign the property into his hands. Thus you will disarm him of any wish to act revengefully, which a legal contest on your part might incline him to do, and—especially as he is a very wealthy man—the matter may be arranged on terms advantageous to yourself.

"Believe me, my dear sir, I would not even *hint* at such a course, if I saw the slightest prospect of a successful issue to a legal contest on your part.

"There is not the *shadow* of a chance.

"Of course, if *you* decide to oppose, I will use every exertion to gain your cause; but the result would, I fear, be absolute ruin to yourself. However, I repeat, we must talk the matter over seriously together.

"I expect to reach the Hall by Wednesday night.

"Until then, believe me, my dear Sir,

"Your faithful obedient servant,

"EDWARD FERRET.

"William Foley, Esq., Morton Hall, B—shire."

MUDDLERS.

THE verb to muddle has a twofold signification—meaning, in the first place, to render foul or dirty, as when a pool of water is muddled by being stirred to the bottom; and, in the second place, to throw into confusion and disorder, as when a man's ideas are said to be muddled by drink, or his affairs are muddled for want of management and arrangement. To muddle is, moreover, sometimes used in the sense of to waste, as when money spent without return is said to be muddled away. With the first, or primary signification of the word, we shall not now concern ourselves, but will say a few words on the subject of muddling as a human characteristic, in the hope of saying something that shall be of use.

Muddling in business—that is to say, in matters of trade, commerce, and speculation—is the first thing that demands attention, seeing that it is a thing that every man suffers from more or less. This it is which is the fruitful source of half the bankruptcies and private compoundings, which, while they disgrace our commercial character, inflict endless loss on the community. Were there no muddlers, there would not be half the difficulty

in carrying on business that there is, and the black column of the Gazette would not exhibit half that frightful list which is now the daily bugbear of capitalists and creditors. The muddler in business is a man generally eager to do great things, without having any definite ideas to work out, and who, therefore, cannot exactly make up his mind, or keep it made up, on any one thing for long together. He is apt to begin one thing and then another, and then a third, and, by complicating all three, thus muddles away his time and, it may be, his capital too. He is the last man among your acquaintance upon whom you can rely to keep an appointment punctually. When he makes it, he intends to keep it; but his memory, like other things belonging to him, is apt to get into a muddle, so that he will make one engagement on the back of another, and, by rendering himself due in some half-dozen places at once, will put it out of his power to present himself at any at the proper time; and if he does arrive at all, he is sure to arrive just too late, when the business, whatever it may chance to be, has been transacted without his participation. Some men, who know what punctuality involves, pride themselves on the exactitude with which they keep appointments; and there are men in London who can say with truth, after having carried on their business for twenty, thirty, forty years, that they never broke an appointment in their lives. The muddler has no conscious pride of that sort. He thinks half an hour is of no consequence, and that one time will do just as well as another; and so it will—for muddling, but not for business.

If you look into the muddler's private affairs—and unfortunately they have to be looked into pretty frequently—you will be sure to make the discovery that his accounts are in a muddle; and, if you want to get them into an intelligible shape, it is not to him that you must look for assistance, but to the experienced professional accountant who, versed from his youth up in all the acts and complexities of blundering, can alone unravel the tangled threads, and spread out the naked facts on the balance-sheet. Then it will most probably come to light that the muddler has been for a long time past losing capital, when he thought he was making a profit; and, while neglecting sources of gain which should have been patent to him, has been pushing his trade in a direction where nothing but loss could be reasonably looked for. One of the most edifying sights in the world to a business man, especially if he be a young man, is the interior of the working establishment of a genuine muddler. If it is an industrial workshop it bears the aspect of chaos. All is litter, rubbish, and confusion. Valuable material is mingled with waste and refuse, and new material has continually to be bought, because the old, from want of order and arrangement, cannot be got at, and is therefore virtually lost. If it is a warehouse it is not much better. There is no system in the arrangement of stock. New consignments get stowed away out of sight, where they are forgotten, it may be, for months, to be unearthed after they have deteriorated and lost half their value through neglect. Goods are sent out without being duly entered and debited to buyers, and so are never paid for; and goods received get thrust aside in corners, instead of being forwarded to their destination. If it is a shop, the same characteristics prevail—confusion everywhere, waste everywhere, and repeated loss of custom, because the things which customers want are not to be come at at the very time they are wanted. When the muddler takes to trade speculations, it is seldom that he fixes on one thing alone, and sticks to that; he is more likely to

begin a thing and forget it when it is half done, in his eagerness to set about another thing which fascinates him. A curious instance of this kind of muddling recurs to our memory. Some few years ago a bustling young publisher, ever in a flurry, conceived the idea of a new almanack, on a plan not hitherto tried. We may call it the P. Q. Almanack. Full of his scheme, he rushed to the study of a literary friend, and, imparting his plan, commissioned him to set about it, putting him at the same time in communication with his printer, and urging both to get on with the work, as the season was getting late. The work went on rapidly, and the whole was completed in good time. A large impression was struck off, and the huge bales of printed paper—no other orders having been given—were delivered at the publisher's, where they were sent down the lift into the underground store. But the enthusiastic publisher had forgotten all about his wonderful P. Q. Almanack, and there the whole impression remained until the end of January in the new year; and, in all probability, they would not have been thought of then but for the untimely presentation of the printer's bill. It was too late to publish now: any man would be laughed at who should bring out an Almanack in February, and no other resource remained than to pay the litterateur, the paper-maker, and the printer—and to sell their joint production to the mill-owner for waste. That this enterprising trader should fail for an enormous sum after a few years' experience, and not pay even a microscopic dividend, is perhaps not to be wondered at.

When the professional man or the student is a muddler he has to pay the penalty in his own person; the business man may and does, by his muddling, annoy and injure those who do business with him; but the studious man can damage only himself. Books and papers have an extraordinary knack of getting muddled before one is aware, and if they are not watched with a wary eye they will get into a chaotic condition almost of themselves. The appearance of litter and confusion, however, is not always a proof of muddle—what looks all disorder to the casual visitor may be the perfection of arrangement as regards the work going on—and no man is to be stigmatised as a muddler because you find him up to the chin in loose sheets, unfolded letters and documents, and books lying open one upon another. The real muddler of the study is he who does not know where to look for his materials when he wants them; who has more trouble to find his books of reference than his references are worth; whose notes have gone fluttering into the waste-basket, or have got twisted up into pipelights—in short, he is the man who has no instincts of order, with whom nothing belonging to him will arrange itself. How such students manage to keep their ideas and intellectual faculties clear of the general muddle in which they live and move is a mystery.

The domestic muddle, after all, is perhaps "the greatest plague in life." A house and home that is thoroughly muddled—that is, not under the influential control of some presiding spirit of purity and order—is no house at all, in the sense of home. Order, which "is heaven's first law," is home's first law also, and one might as well expect to feel at home in Billingsgate Market as in a dwelling whence order is banished. Where the mistress of a household is a muddler, woe to that household. There, you may be sure, the golden maxim "A place for everything and everything in its place" is altogether ignored. Instead of that, there is no place for anything, and whatsoever thing happens to be wanted at any time will have to be looked for in the last place where it was used, if anybody can remember

where that was. The result is not only loss of time but loss of temper, loss of comfort, loss of rest and ease, and loss of money too; and, worse than all, is the moral deterioration of the atmosphere, and the setting up of a chronic condition of irritation and annoyance in place of the genial kindness, forbearance and mutual self-abnegation which, wherever they prevail, make a man's home a blessing prized far above all that lies beyond it. It is to be feared that the simplicity of our homes has suffered not a little of late years from the march of a rather doubtful civilisation and quasi-refinement which have made prodigious changes within the four walls of our dwellings. Muddle of a certain kind is much more common within doors than it used to be in days gone by. The fashion which drapes our limbs according to its own unreasoning and despotic will has for years past been busy in draping our apartments and furniture. Time was when chairs and sofas were for sitting and reclining on, and tables and sideboards stood ready for the reception of anything you wanted to place on them; now we have changed all that. Our seats, in the present day, are not so much for sitting on as they are to look at—they are swaddled in masterpieces of Berlin wool-work, of crocheting, of tatting, of netting, or of some other needlework or knitting mystery; but they are not allowed to be comfortable quarters for the weary body. If you sit down in an easy chair you are clutched in the poll by the fibrous fangs of an anti-maccassar; you can't get on to the sofa without disturbing some of the embroidered pillows that cover it from end to end. If you drop on to an ottoman you run the risk of damaging Miss Clementina's last grand *chef-d'œuvre*. Then, as for using a table in any practical way—say for folding a newspaper damp from the press, or for spreading out a map you wish to consult—you might almost as well think of swallowing it; for the tables are all covered with what the French call *pieces de luxe*, that is, with a crowd of knick-knacks under glass shades, wax-flowers, statuettes, small sham bronzes, illustrated books in gaudy covers, and without end as to variety; ink-stands with no ink in them, and tiny vases each with its little flower, artificial, or half faded. There is no household polishing of furniture now-a-days; but, French polished once for all, it has to be loaded with treasures of a doubtful kind, or it has to be draped in crochet-work, or netting, or some new-fangled industry or other, the only use of which is to prevent as far as possible one's costliest articles of furniture from being of any practical use at all. The height of fashion as to drawing-rooms and boudoirs would seem just now to consist in rendering them as much like the shops of the dealers in *bric-a-brac* and all kinds of fancy goods as may be. The thing is considered done to perfection—as we have seen it done again and again—when a large, richly-carpeted room is so crammed with elegant furniture that it is impossible to move about in it, and every piece of furniture is so loaded with brilliant-looking objects of one kind and another, that it could not be used even were there space to use it. Strangers and visitors are expected to admire these elaborate displays, and to ignore the fact, of which all are secretly aware, that this heterogeneous mass of valuables is but a congregation of dust-traps, necessitating a grand and frightful muddle when dusting-day comes round. We shall spare the reader the pulverous details of the dusting process; and we shall spare him also a descent into the regions below, where a sight of the muddler's kitchen is enough at average times to banish one's appetite for an indefinite period.

Some people who are orderly enough in their homes

are invariably thrown into a muddle on undertaking a journey. They can never make up their minds what they will take with them, and what they will leave behind, or whether, indeed, they will leave anything behind. The worst subjects of this class are the elderly dames who have lived much alone; one sometimes sees them in their nervous distrust travelling about with all their worldly possessions—say fourteen or fifteen small packages and bags, together with a huge barge of a port-manteau, a poodle-dog which is too fat to walk, and has to be carried like an infant, and a squalling green parrot in a cage. When such a forlorn traveller has to change trains at the Mugby Junction, and is left late at night high and dry amidst her surroundings on the dreary platform, then it is that the travelling muddle is at its climax. It is edifying to compare such a picture with Sir Charles Napier setting off for India to belabour the Sikhs, and carrying an outfit of half-a-dozen shirts, socks ditto, a pocket boot-jack, and a set of shaving tackle.

Such are some of the every-day phases of muddling which we are sure to meet with now and then in our experience of life. Looking to the stream of hindrances that muddlers throw in their own way, and the confusion in which they live and move, it is really wonderful what an amount of business some of them will manage to get through. The reason must be, that, though deficient in order and system, they have other qualities, which, in the long-run, compensate the want of order and system, and enable them to triumph in spite of such want. They can never be so efficient as the men to whom order and system have become a kind of instinct, in consequence of their having trained and disciplined their minds in subjection to the great first law. The connection between clear thinking and orderly action is too obvious to need pointing out. Muddle is the outcome of the want of mental discipline. If you note the unlogical sequence of ideas among the unlettered lower classes when you attempt to reason with them, you will see that whatever their habits and routine of life, their minds are for the most part muddled. It may be that they do not get into muddles in the ordinary conduct of their affairs, because these require no great sagacity, and habit has rendered them matters of rote rather than of thought; but give such people anything to do that demands a preconceived plan, and they get muddled directly. The most fatal results of muddling take place when they who should control and administer, become themselves bewildered and confused. The administrative faculty cannot coexist with a habit of muddling and mixing things together. A clever administration does not aim at doing what Julius Cæsar is said to have done, that is, to employ himself in four different ways at once; he finds that it answers better to do one thing at a time; and, best of all, to do the right thing at the right time.

TWO MONTHS IN SPAIN.

II.—MADRID.

THE journey from Paris to Madrid, by mail train, takes thirty-six hours. If you register your luggage, and take a bottle of Bordeaux wine and a cold fowl in your bag, you may eat and sleep all the way to Madrid, without breaking the journey. I stopped at four or five places, but that was a matter of taste. I had no night travelling, and consequently saw the country to the best, or rather to the worst advantage; for, in regard to scenery, I was greatly disappointed. The line of rail through the Pyrenees, by the pass of Bidassoa, involves

no great work of engineering compared to that from Vienna to Trieste, or that still more wonderful and interesting journey through the Apennines, from Bologna to Florence. Perhaps in early autumn, through some of the central passes of the great range, there may be picturesque beauty and grandeur, but on these western spurs from Irun to Ernani and San Sebastian, it is a rugged, barren, dreary prospect; no green bush or tree to relieve the eye or break the monotony, but as we burrow from ridge to ridge, it is the same collection of ugly boulders and serrated peaks, as if the ashes of a primeval world had been heaped into mountains, and the storms of time had washed them into sandy ruts and jagged angles. After you have left the great range behind, the barren undulations continue till you approach the hills round Madrid, when they become more rugged and fantastic.

But to return to the Escorial. After a short night's rest, I got up at 7 A.M. I had engaged a man for that hour to take my luggage down to the station, but found there was no one stirring, and no appearance of the porter. The train left at 8 A.M., and we had three-quarters of a mile to go, and I began to get a little anxious. At length the door was opened, and I believe I might have gone away without paying my bill; and it was not till the man had shouldered my portmanteau that I said that I wished "pagar mia cuenta." You see it is not so difficult after all to make a foreigner understand when money is in question. The landlord appeared; there was no occasion for an account; the amount was only 36 reals; I gave him a 10-franc piece, and we parted very good friends.*

I arrived in Madrid the day on which Marshal O'Donnell was interred with great military pomp. The evening on which I watched the setting sun over the Bay of Biscay, that general was closing his troubled career on the next floor to me. He was only fifty-eight, and forty years of this time must have been spent in constant excitement and never-ceasing intrigue and ambition—sometimes going with the party of progress, and again becoming sycophant of the court, but withal, perhaps, about the best man among them; for "Cæsar and Pompey are very much alike." *Demortuis nil nisi bonum* seems the maxim just now, and all parties joined in doing honour to his remains. It was a grand military display—the Duke of Wellington's funeral on a small scale. The same evening there was

a bull-fight in the Plaza de Toros; but more of this hereafter.

There are boarding-houses in Madrid, where one may procure board and attendance for 30 reals; and if one had a knowledge of the language, this arrangement might give him a chance of becoming better acquainted with the place and people than at a hotel among English and Americans; but on a rapid journey, the mere stranger has no alternative but to go to a first-class hotel. I may mention here that the Spanish *maitre d'hôtel* still retains his reputation for exaction where he can, and I found, when rather late, the absolute necessity of making arrangements and terms before entering my apartments. It is not usual, nor very pleasant, for an English gentleman to stand with his carpet-bag in hand, and drive a bargain with the landlord. At the Hôtel de Paris I was shown into a room on the third floor, and when I got my account, after eight days, I found they had charged me 60 reals a day. I thought this a mistake, and remonstrated, but was assured it was the regular charge. I made the acquaintance of a Spaniard who occupied the next room to me, and on comparing notes afterwards, on a railway journey, I found he was charged 40 reals for the same room that I had paid 60 for. I confess this was rather humiliating to an old traveller; but I found it was a common practice to take it for granted that an Englishman should pay double the amount of a Spaniard. There are three or four large hotels in and near the Puerto del Sol, which claim to be on the English and French principle, and certainly they are a great improvement on the old Spanish *fondas*, as I came to know afterwards. At the same time, there are second-class hotels in this neighbourhood, such as the Hôtel de France, of almost equal comfort, and quite equal cuisine, at 30 to 35 reals, or about 7s. 6d. a day, including all charges. The great complaint, however, about them all is the indifference with which they treat their customers when they have secured them. I had few wants, and was out all day, so that I had not much to complain of, but the English and American families complained most grievously of the absence of all ordinary attention.

For a city of less than 300,000 inhabitants it is marvellous the number of people you see idling about the streets of Madrid. I happened to have my room on the third floor of the Hôtel de Paris, overlooking the Puerto del Sol—the centre of the city, and great rendezvous of all the idle *quidnuncs*, "waiting to see what may turn up." Friday was the fiesta of St. Eugénie, whoever she may have been. The shops were all shut. We went with orders to see the Queen's stables and the Armeria (the Royal Armoury); they could not be opened, it was a fiesta. It was the same everywhere. All Madrid seemed turned out in the street. There were neither religious exercises nor profane amusements going on. It was simply a day to idle about the streets, to talk, smoke the paper cigarettes, and drink sugar and water. I learned that they had nearly a hundred of these fiestas, or saints' days. Once, in a fit of reform, the Government petitioned the Pope to make some reduction, and his Holiness' compromised the matter by reducing them to forty or fifty, on condition that they would shut their shops on Sunday, and thereby "assume a virtue, if they had it not"—an engagement which they seem to have kept.

There is very little difference now in any of the capitals of Europe with regard to dress. The old Spaniard has still the mantle thrown over his shoulder; but tweed great-coats and comforters are more common. The ladies are dressed in the last Parisian style, except that

* I may state here that the Spanish coins are very easily understood. The copper coins in use are the quartos.

1 quartos=about $\frac{1}{2}$ d.
8 $\frac{1}{2}$ quartos=1 real=2 $\frac{1}{2}$ d.

SILVER COINS.

8 $\frac{1}{2}$ quartos=1 real.
4 reals=1 peseta, or franc.
8 reals=2 peseta, or 1s. 8d.
10 reals=half duro, or 2s. 1d.
20 reals=1 duro or dollar, or 4s. 2d.
A five-franc piece goes for 19 reals.

GOLD COINS.

1 duro=20 reals, or 4s. 2d.
2 duros=40 reals, or 8s. 4d.
1 doublon=80 reals, or 16s. 8d.
5 duros=100 reals, or 1 Isabelino.

The intrinsic value of the Isabelino is not a sixpence beyond our sovereign; but the exchange being now against England, instead of getting 98 reals for a pound, we only get 96; so that if 96 reals=£1, 1 real will be exactly 2 $\frac{1}{2}$ d. Bank-notes are a legal tender, but gold is preferred, and should be taken in exchange for circular notes. To make the matter quite clear, if you wish to cash a £10 circular note at Madrid, and the exchange is nearly par, or say 98 reals, you get 980 reals for your note, say in 40, 80, and 100 reals of gold, or of silver 4, 8, 10, and 20 real pieces. And let me caution the traveller not to take in his small transactions an 8 real, or 2 peseta piece, for a half-duro or 10 reals; the latter are known by having the "two pillars" on them.

many of them, instead of bonnets, have a black veil thrown gracefully over the head. With the appearance of Madrid I was agreeably surprised. It is a small Paris, with a dash of the Oriental; the green jilmills, moved up and down with a connecting bar, the small balcony before

near to the Escorial, and the upper part of brick, stuccoed. The streets are broad and clean, and not badly paved. The Puerto del Sol, the centre of the city, is about the size of Trafalgar Square, in London, and from it radiate nine streets. The town stands on a plateau

ROYAL PALACE, MADRID.

each window, and the matted floors, reminded me a little of old times in India.

There is little interest attached to Madrid, simply because it is a modern city, partaking more of French than Spanish character. It was raised by Philip II from a small town of 10,000 inhabitants to the dignity of the capital of Spain, under whose auspices it rose to nearly 200,000 inhabitants. The site was chosen as being near the centre of Spain; but experience has shown that he could not have chosen a worse situation as regards climate, production, and trade. The River Manzanares for many months of the year is almost a dry bed; the Guadarama, a snow range of mountains a short distance to the N.W., send their chilling, killing breezes over the plateau on which the city stands. It is, therefore, exposed to great heat and cold, or, according to the Spanish adage, "three months of winter, and nine months *del inferno*." Strangers are cautioned "to be careful against night air and sudden changes from sun to shade;" and, perhaps, "prevention is better than cure," though some of the natives seem to carry their caution to a preposterous extent, muffling themselves up to the nose in their spacious Roman togas, and just leaving room for the cigarette.

The city, as I have said, being of comparatively recent date, possesses no remains of either Roman or Moorish architecture. The houses are mostly of five to six storeys; the lower storey of the fine light granite got

of eight miles circumference, about 200 feet above the plain, and 2,600 feet above the sea. The Royal Palace stands on the western face, and the Retiro, or public gardens, to the east, and between these the *Callé de Mayor* and *Callé de Alcalá* form the connecting link—the latter, leading into the Prado, is one of the finest streets in Europe. It expands, as it goes eastward, into a broad boulevard, with double rows of lime and acacia trees. The Prado is the Rotten Row of Madrid, a mile and a half long, with four broad avenues, skirted with rows of rather stunted trees. Near the Prado are situated some of the most interesting objects to be visited.

First in interest and importance is the Museo, or gallery of paintings. This is the only place that is thrown open to the stranger daily, and it is a never-failing source of interest and information, and in many respects is second to no gallery in Europe. To give you an idea of its value and importance, I may mention that there are 2,000 pictures, of which seventy are by Velasquez, fifty by Murillo, fifty-four by Ribera, a painter not so well known to us, and the remainder by some twenty other national artists of note. They have also many fine works of Raphael, Titian, Tintoretto, Guido, P. Veronese, Rubens, Vandyke, etc. But if you wish to become acquainted with Spanish art, I would recommend you to read "The Artists of Spain," by William Stirling, now Sir W. Stirling Maxwell.

On the same side is the Artillery Museum, for which I got a private order. It is admirably arranged, and contains many specimens of arms, from the earliest to the present day; a great variety of models of cities and fortifications, and of every kind of military equipage. One would fancy they were the most military nation in the world, so perfect are all their arrangements. A little farther on is the Botanical and Zoological Garden, containing little to be seen; and beyond, the convent and church of Atocha. Here, at five p.m. every Saturday, the Queen comes to pay her devotions. The family and attendants drove up in four state carriages, drawn by three pairs of mules each. I had no idea that these animals could be trained and dressed up to look so smart and sprightly. I had a good view of her Majesty and the family, who were in a side gallery overlooking the high altar. She is very stout, and rather plain, but with a pleasant face. Queen Isabel was on her way to this chapel when she was attacked and stabbed by an assassin; and the dress and jewels which she wore on that occasion were presented to the Virgin of this church, with many other valuable offerings. There are no churches in Madrid of much beauty or interest.

The Palace, which overlooks the river on the western promontory, is a noble building, the basement story of fine granite, and the upper part of white stone, which at a little distance has the appearance of marble. This building is little more than a hundred years old; part of the original design is still unfinished, and, like everything Spanish, it looks best at a distance. The courtyards, or patios, within the quadrangles, and the passages round the building, are in a state of great neglect and dilapidation; but, viewed at a little distance, the fine classic outline, lighted up in the rays of a bright sun, has an imposing appearance. I am told that the interior is ornamented with a profusion of white and coloured marbles, and no end of gilt capitals and cornices, but with scarcely any real works of art, as these have been removed to the Museum. The palace is not open to the public. Beyond the palace, and over the bed of the Manzanares, is a scene of barren desolation, and it is a relief when the eye is brought up with the snowy peaks of the Guadarama.

The Queen's birthday was celebrated while we were in Madrid, and we had an opportunity of seeing all the public officers and grandees arrayed in their court dresses, fine equipages, and no end of tinsel and show. There seemed as much gold lace about their uniforms as would have paid the interest of their national debt.

The system of lotteries is carried on here as extensively as at Rome. It is known to the reader that the profits of the Government lottery is one of the sources of the Pope's revenue, and perhaps it may be from this holy sanction that the institution has taken such a strong hold on all intensely Roman Catholic countries, such as old Naples, during the Bourbons, the cities of the Church States, and in Spain. There are numerous places open for the sale of tickets in every street, and they are thrust in your face at every corner; and this corrupting and demoralising system of gambling becomes a passion in every Spaniard, from the beggar to the prince.

There are at each of the principal hotels a number of ciceroni, ready to attend the stranger over the city at a charge of 5s. to 6s. a day; but these men seem to have little influence in gaining admission to public places, and I found I got on much better without them. Nothing will rouse the Spanish official out of his *laissez aller* and perfect indifference to the curiosity of the stranger, where he has nothing to gain by the effort.

The shops in the main street of Madrid are filled with goods from north of the Pyrenees, and at prices 20 per cent. above London and Paris. Even the cigar boxes are marked "Londres, two reals." We expected something better for 5d. than a London cigar. It is a strange inconsistency that a country which still possesses Cuba and the Philippine Islands, and has made tobacco a monopoly and a chief source of revenue, should be entirely without a Manilla cigar, and should charge four reals, i.e., a franc, for an ordinary Havannah. I raise this question of smoke, merely to show how the wind blows. It is the case with everything else. Their blind monopoly and restrictive tariffs close every avenue to healthy trade; and unless you are content to go in rags, or brush up the old mantle, and live on garlic and brown bread, you must pay for "the protection of trade and the necessities of the State."

I have said that you pay a stated sum for board, attendance, and table wine. It may be from 8s. to 16s. a-day, according to apartments. You are not expected to add to the expenses of your dinner by ordering a pint of sherry at 4s., and I am sure we are all the better for it. There are, however, some exceptions to this rule. Formerly the English were blamed by the natives, and perhaps with some justice, for raising the prices of hotel bills, labour, conveyances, and everything else where they were known to travel. That charge can be brought against us no longer. We have been entirely eclipsed, and almost left out in the cold, by our wealthy American cousins. They travel with their couriers, get the best rooms, and without any exception are the almost exclusive patrons of champagne and the best French wines. They go in for the best, and to see the best, of everything, and perhaps they are right; but it has to us Britishers sometimes the appearance of ostentation. This does not apply to many of the "good old families," than whom no more kind, genial, and agreeable companions can be found in the world.

Three or four days may suffice to see the lions of Madrid. The chief are the Royal Museum and the Artillery Museum. The Armoury they profess to open to strangers one day in the week; but if the day be wet or damp, or a fiesta, there is no admission. After some little trouble we got an order, and were admitted; and it is certainly worth some little delay and trouble. The arms and armour, Roman, Gothic, Moorish, and Mediæval, are all of historical interest. Ranged along the wall are equestrian figures of knights in rich German and Italian armour, and suspended over their heads are the flags taken in battle during their long wars—in fact, forming a history of the chivalry of Spain, such as it has been, and which will not bear much reflection. Passing from this, we visited the royal stables and coach-houses, with which we were somewhat disappointed. The best horses are those imported from England and France. The Queen's mules are the finest in Spain, and will do double the labour of horses.

In coming up from the palace to the great square Palaza Mayor, I noticed houses completely riddled with large and small shot, and many of the windows still broken and the glass shattered, from the attacks of the insurgents in June, 1866. Nothing could be more disgraceful to a nation than the heartless sacrifice of human life on that occasion. It was no question of national liberty, but simply who should be at the head of the army; and after all danger and disturbance were over—after a mock trial—some fifty or sixty deluded beings were shot in cold blood. But what were sixty lives to the intrigues and ambition of the Narvaezes, Prims, and O'Donnells?

The soldiers of the line make a poor appearance: they range from five feet four inches to five feet six inches. They are pressed into the service by a forced conscription, and are consequently the poorest specimens of Spanish humanity—very inferior even to our militia during the Crimean war, who seemed to be the rakings of our prisons and workhouses. It is not on these, however, that the Government depend: they have in the army a sort of *imperium in imperio*, a corps of horse and foot of 20,000 picked men from the most intelligent, safe, and most unscrupulous soldiers, that may be depended on, and take their orders from the men of power—whoever they be—and ask no questions. They are hated by the people, and this feeling is reciprocated, for the “guard civic” hold the *posse comitatus* in utter contempt. We were treated every morning with a military parade of a regiment of foot with their band of forty men, a squadron of lancers or guards, and a brigade of four guns, marching through the Puerto del Sol to relieve the guard at the Royal Palace. I remarked to a Spaniard that many of the boy officers, with peg-top trousers and waists like wasps, had two or three medals—where or how could they have gained them so early? His reply was that these were gained for passing examinations, or in civil broils that no gentleman would feel honoured by. These were his words, and we will pass them for what they are worth; it is sufficient to mention the fact as stated to me.

In the Calle Alcalá there is a Royal Academy called San Fernando. There are about 300 pictures here, but only three or four of any note, by Murillo—that of St. Elizabeth of Hungary curing the sore heads of the pauper children, called El Tinoso, or The Scabby; two of “The Roman Senator and his Wife,” etc. On the upper floor is a small cabinet of natural history, with the skeleton of a megatherium, found in Buenos Ayres. I do not know if Mr. Owen or Mr. Hawkins had this specimen before them when they modelled those in the garden of the Sydenham Palace, but this is the most perfect fossil of that pre-Adamite animal that has ever been found. The body is fifteen feet, and the tail, with all the joints complete, is about eight feet long.

I had hoped to witness the proceedings of the Parliament, as the Senado and Congress should have been opened in November, but when I made inquiry, I was told that no one knew when they might open, and few cared, as they were by no means “popular assemblies.”

I soon got tired of visiting these places; there is such a constant desire here to get out in the open air to enjoy a delightful lounge in the gardens of the Retiro, a stroll in the afternoon along the Prado.

JUAN DE VALDES.

JUAN DE VALDES* was a Spanish nobleman who, with his twin brother Alphonso, formed part of the court of Charles v. They resembled each other so wonderfully in appearance and character that Erasmus, writing to the one, says the other must as a matter of course be included in his epistle. They were devoted to study and literature; and early in life appear to have embraced Protestant doctrines, for which Juan was in great danger of being imprisoned by the Inquisition. His brother seems to have thrown over him a pro-

tecting arm, which he was able to do from the high position he occupied at court. Juan afterwards retired to Naples, where he exercised a deep and lasting influence on the characters of many, some of whom were, like himself, of high and noble birth. They became inquirers after truth, and he was their spiritual father. Among many remarkable for their Christian character were Peter Martyr, Giulia Gonzaga, Bernardino Ochino di Sienna, Pietro Carneseccchi, secretary of Clement vii., who was afterwards burnt to death; and Jacopo Bonfadio, who followed Valdès with poetical enthusiasm, and said of him after death—“Where shall we go, now Señor Valdès is dead? This has truly been a great loss for us and the world; for he was one of the rare men of Europe, and those writings he has left most amply show it. He was, without doubt, in his actions, his speech, and in all his conduct, a perfect man. With a particle of his soul he governed his frail and spare body; with the larger part and with his pure understanding, as though almost out of the body, he was always raised in the contemplation of truth and divine things.” The remainder is very lively and descriptive.

J. de Valdès’ “Hundred and Ten Considerations” (styled “Divine” by some) were written in connection with the conversations he had with those friends, and so highly were they then esteemed that they were translated into Italian, Dutch, German, French, and English—the latter under the sanction of George Herbert, who says of them—“There are three eminent things observable therein. *First*, that God in the midst of Popery should open the eyes of one to understand and express so clearly and excellently the intent of the gospel in the acceptance of Christ’s righteousness (as he sheweth through all his Considerations), a thing greatly buried and darkened by the adversaries and their great stumbling-block. *Secondly*, the great honour and reverence which he everywhere bears to our dear Lord and Master; concluding every Consideration with his holy name, and setting his merit forth so piously, for which I do so love him that, were there nothing else, I would print it, that with it the honour of my Lord might be published. *Thirdly*, the many pious rules of ordering our life, about mortification and observation of God’s kingdom within us, and the working thereof, of which he was a very diligent observer. These things are very eminent in the author, and overweigh the defects, as I conceive, towards the publishing thereof.”—George Herbert, Bemerton, Sept. 27 (1637).

These “Considerations” were treasured up and read along with their Bibles by the Christian martyrs of Spain, in secret places, until the Inquisition rooted out all “heresies” by its prisons and the stake. We give two specimens of the work.

The twentieth Consideration is thus headed:—“That men should regulate the mind, when disordered, convalescent, and in health, as they are wont to treat the body under similar circumstances.”

I conceive that they who belong to the Kingdom of God should regulate the mind, when disordered, convalescent, and in health, as discreet men regulate the body, when disordered, convalescent, and in health. I mean to say that, as the discreet man, in bodily sickness, seeks out wise and experienced physicians, who, by prescribing suitable medicines for him, and by subjecting him to a proper regimen, cure him; so he who finds himself mentally sick ought to seek out an experienced spiritual physician, or, indeed, several such, who may put him in the way of knowing Christ, in order that, being made a member of Christ, he may be cured of his mental ailment; of which, I take it, all those are cured who, being called of God, believe in Christ, while all others remain diseased.

Again, I mean to say that, as the discreet man, when convalescent from bodily ailment, always lives most attentive and

* “The Life and Writings of Juan de Valdès, Spanish Reformer in the Sixteenth Century, by Benjamin Wiffen; with a Translation from the Italian of his Hundred and Ten Considerations.” By John T. Betts, London: Bernard Quaritch, 15, Piccadilly.

observant of himself in all things, careful lest he should eat anything that might cause him to relapse, as also careful not to commit any other excess that might cause him to fall into the same disorder; so he who is endowed with a tolerably sound mind will have, while only convalescent, to live very careful of himself in all things, and very self-observant, seeing well to it that every obstacle be removed out of his way, and not engaging in anything that might cause him to relapse, or to lose aught of the health that he has acquired, being equally attentive and vigilant, when in conversation and other worldly matters, not to take any part in them that may do him harm—just like a convalescent at a banquet or elsewhere, who fears lest he should err in anything whereby he may possibly injure his bodily health; feigning to eat, but not eating, and so conducting himself that he neither damages his own health, nor offends those persons who have their eyes upon him.

Moreover, I mean to say that, as he who, having been sick, and having been convalescent, although he may find himself in health, if he be discreet, does not permit himself to indulge in eating things prejudicial to the body, nor to injure himself by excessive exertion, although he may not live with that attention, nor with so great care as he did when convalescent, fearing lest he should again be overtaken by that sickness of which he was cured; so, likewise, he who finds himself cured from some mental infirmity, feeling himself much mortified and much quickened, ought not to live negligently, nor to deviate into practices and conversations relating to things of the external world, fearing lest through mental depravity he should return again into the past disorder, considering that relapses in diseases of the mind are worse than relapses in diseases of the body. Though from this relapse God himself ever preserves those who have gained health by regeneration and renovation, wrought by the Holy Spirit in them who are incorporated in Jesus Christ our Lord.

The seventieth Consideration is "Of the Nature of those three Gifts of God, Faith, Hope, and Charity; and wherein their eminence amongst other gifts consists; also the pre-eminence of Charity."

Considering that the apostle places Faith, Hope, and Charity amongst the highest and most excellent of God's gifts, I have frequently occupied myself in examining in what this eminence consists, and not having been able rightly to understand of what they consist, it appears to me that I have not been able to understand wherein consists their eminence over the rest.

But beginning now, as it appears to me, to understand of what they consist, I begin likewise to perceive wherein their pre-eminence consists.

I understand that Faith consists in this: that a man believes and holds for certain all that is contained in Holy Scripture, placing his trust in the Divine promises contained in them, as if they had been peculiarly and principally made to himself. As to those two parts of faith, Belief and Confidence, I understand that the human mind is in some measure capable of the one; I mean to say, that man is self-sufficient to bring himself to believe, or to persuade himself that he believes; but I understand him to be incapable of the other. I mean to say, that he is not self-sufficient to bring himself to confide, nor to persuade himself that he does confide. So that he who believes and does not confide, shows that his belief is due to mental industry and human ability, and not to Divine inspiration; and he that in believing confides, shows that his belief is due to inspiration and revelation. Whence I understand that confidence is a good sign in a man whereby to get assured that his belief is due to inspiration and revelation.

I understand that Hope consists in the patience and endurance with which the man that believes and confides awaits the fulfilment of God's promises, without impiously engaging himself in the service of Satan, or vainly in that of the world, or viciously in that of his own fleshly lusts. Like an officer who, having been promised by the emperor that on his arrival in Italy he would give him a commission, although the emperor delays, and he is solicited by many princes, who would avail themselves of his services, he declines to accept any terms, awaiting the emperor's arrival, fearing lest, if he should come and find him in the service of another, he would be unwilling to employ him. This hope presupposes faith. I mean to say, that to wait involves necessarily faith upon the part of him who hopes, by which he credits what has been said to him, and places trust in what has been promised him, for otherwise he could not keep up his expectation. And that hope properly consists in this, I understand from some passages which we

read in the Gospel, like that of the ten virgins who wait for the bridegroom, and that of the servants who await their Lord's return (Matt. xxv).

I understand that Charity consists in love and affection, which the man who believes, confides, and hopes bears to God and Christ, and similarly to the things of God and Christ, being peculiarly attracted and enamoured by faith, confidence, and hope; so that, because the man who has these three gifts of God is united to God in believing, hoping, and loving, it is with great reason that these three gifts rank above all others as the highest and most excellent.

Having understood in what these three gifts of God consist, and what constitutes their pre-eminence, and desiring to understand for what cause the same apostle places Charity above Faith and Hope as being most eminent (1 Cor. xiii.), I think and hold it for certain that the pre-eminence consists in this: that he who believes and confides will never be firm in faith, unless he find pleasure and relish in believing and confiding; nor will he who hopes be firm in hope, unless he find pleasure and relish in hoping.

Charity, then, being that which gives the taste and relish with which Faith and Hope are sustained, it plainly follows that Charity is more eminent than Faith and Hope, forasmuch as it maintains and sustains the others, whilst unaided it maintains and supports itself; and, inasmuch as Faith will fail when there will be nothing to believe nor to confide in, and Hope will fail when, Christ having come again and the resurrection of the just having been accomplished, there will remain nothing more to hope; but Charity will never fail, because it will always have objects to love, and will always have what it can enjoy; for in the life eternal we shall love God and Christ, and we shall find pleasure and relish in the contemplation of God and Christ; we who in this life have lived in Faith, Hope, and Charity, incorporated in Jesus Christ our Lord.

LIFE IN JAPAN.

IV.

GRAVEYARDS.

REVERENCE for the departed is a striking feature in the Japanese character. The most lovely spots are selected as burial-places, generally on hill-sides, and commanding magnificent views of the surrounding country. Only small plots of ground here and there can be made available for the purposes of interment; and each plot is carefully terraced and levelled, and set apart for the graves of a single family, reminding us of the chapels and vaults in our own country churches, reserved as the last resting-places for the owners of one name.

The graves occupy but little ground, being circular, and not more than about two feet in diameter. Above each the ancestral tablet is raised, and small figures are also frequently placed upon them. Terrace above terrace, far up the hill-sides, rise these little open-air chapels, connected one with the other by a few steps, each with its row of solemn grey granite figures and tablets.

Every one is carefully tended; the bamboos hold fresh flowers, gathered sometimes from the hill-sides, sometimes brought from home gardens. Day by day the relatives sweep and garnish these last resting-places of their beloved ones, burning the votive incense-paper, the sweet perfume from which hangs about these favoured spots, and is borne on the breeze. Rising ground is almost always selected for these beautiful cemeteries, and the mountains surrounding a large town are covered with these mementoes of the dead. A temple is generally attached to each.

Wandering at sunset amongst these tombs, one sees so much evidence of repose, and tender, thoughtful care, that the mind becomes insensibly soothed and filled with a sentiment of tender regret for those who lie around. From beneath rises the distant hum of a busy town, situated on the shores of a land-locked bay. On all sides lofty hills raise their rounded or pointed

summits, testifying to the internal igneous agencies, which are still so actively at work in producing geological changes in these beautiful regions. Below, one sees the carved and fantastic roof of the temple, whose priests are guardians of the tombs; and the frequent sound of

ripple, and the tracks of the fishing and pleasure-boats that glide quietly over its surface. The delicious perfume of orange and citron blossoms, mingled with the scent of the Rivei-wha, is wafted on the air, and to some extent compensates for the absence of the rich concert

REVERENCE AT THE TOMBS. (Facsimile of a Japanese drawing.)

silver-toned bells, and the chanting of monotonous prayers, which ascend from the building, indicate their presence, and the observance of the prescribed services. The tall pines and graceful bamboos wave overhead in the gentle evening breezes, which breathe softly over the surface of the bay, where are mirrored the gorgeous crimson hues of the sunset sky and the outlines of the opposite hills, behind which the sun sinks slowly down. The smooth water is broken only by a gentle

of song with which the birds in our own country usher in the evening. One would have thought that amongst these quiet groves, hallowed to the dead, birds of all kinds would have abounded, choosing these spots as a special and safe retreat. There is, however, a singular absence of winged life in Japan, particularly of the finch tribe, that contributes so many sweet songsters to our English woods.

The ideas of the Japanese as to the immortality of the

soul are vague, though the solicitude bestowed on the body's resting-place can only be given under the impression that their loved ones are conscious of their care.

HOMAGE AT THE TOMBS.

When a death takes place a priest is sent for, who offers up prayers. Friends assemble, all the women dressed in white garments and hoods, white being the colour emblematic of mourning and death.

The tablet, with the deceased person's name carved upon it, in figures resembling Chinese characters, is prepared during the owner's lifetime; after death the priest gives an additional name, which is also inscribed on the *sisak* or tablet. The funeral generally takes place an hour or two before sunset. The body is placed in a sitting posture, in a coffin shaped like a tub; a white wand and a pot of powdered charcoal with some lime are placed within, the antiseptic and deodorising properties of these substances having been made use of for a long time by the Japanese. The grave is made circular, and the inside is smoothly plastered with mortar made with a superior kind of lime; the coffin is deposited within, slabs of stone are placed across, and a temporary wooden structure is erected over it. At the end of fifty days, the prescribed season of mourning, this is removed, the ancestral tablet raised to its place of honour, with the temporal and spiritual names of the deceased, the latter in gilt characters, engraved upon it.

Two pieces of bamboo, to hold flowers, and a tray for the incense-paper, are put in front, and relatives pay homage at the tombs by replenishing the flowers, and setting alight the slow-burning incense-paper. In the accompanying facsimile of a native drawing, a man, woman, and child are thus worshipping in front of a tablet. The man is on his knees, and holds in his hands a rosary, which is identical in its uses with that of the Romish church. The woman directs the child's attention to the holy name on the upraised tablet. Flowers have been gathered by affectionate hands, and placed in the stands prepared for them; water is kept in a bucket, from which the bamboos are replenished, that the flowers may retain their freshness as long as possible. The floral treasures of Japan yield their tribute to the dead, scarcely a grave being without its sprays, flowers, or blossoming shrubs.

In the month of August a festival is celebrated, called *Bong*, when the dead are supposed to revisit their homes. On the first night of the feast lanterns of every shape and kind, ornamented with the greatest variety of coloured devices, silk tassels, etc., are suspended round the tombs, which, extending as they do in every direction up the hill sides, cause them to appear as if streams of light were gently flowing down. On the second evening the departed spirits are supposed to return to their resting-places; and, to convey them thither, small boats are made of straw, and so constructed that lanterns can be placed within. These are conveyed to the sea shore by the relatives, with much ceremony, and floated on the waters, which carry them whither they will, unless the frail bark chances, as is frequently the case, to be consumed by the light from the candle within—the consummation most wished for.

Amongst the *Sin-toos*, the most widely spread of the Japanese creeds, the idea is prevalent that on the death of the body the spirit passes at once to a place of happiness or misery, according to the way in which the life has been spent—their standard of virtue being very similar to our own, but unhappily it is just as seldom attained.

There is a curious custom which assists the bonzes in

extracting money from the pockets of the believers; namely, that of obtaining loans, for which they return bills of exchange payable in another world; and these bills are buried with the lender. Again, near one of the inland monasteries there is a lake, and a devotee will sometimes present himself to the priests, desirous of conveying messages from this world to the next, by plunging into its sacred waters. Papers with writing, from living friends to dead, are placed upon his person; weights are attached to him; and in the sight of the monks, who assemble on the shores to perform various rites, he paddles himself in a small canoe to the centre of the lake, and plunges into the deep waters, never to rise again.

All these strange and terrible customs show that the Japanese, together with all nations that are not utterly degraded, possess the idea of a future state, though in a most imperfect and uncertain form.

MOURNING.

The period for the outward display of mourning for the dead varies with the relationship to the deceased, and with the custom of the different provinces. The body remains unburied for six or eight days, during which time friends and relatives assemble round the coffin, dressed in white garments. The near relatives fast from the death until the funeral, eating neither flesh nor fish; they also abstain from drinking every description of sakee; tea, rice, and vegetables being all they are allowed to partake of while the corpse lies unburied. Smoking, however, is permitted.

All the mourners present at the funeral are dressed in white clothes. After the coolies have retired, who have brought the coffin to the grave, the chief mourner lights several incense-sticks, and distributes them amongst those present; then waves his before the tablet, bowing nearly to the ground each time; all the other mourners (men and women) in succession repeat these movements.

If a husband or wife dies, a space is left by the grave for the remains of the surviving partner.

The shroud of the wife is formed of the veil she wore at her wedding. After the funeral, the dress is modified, black being the colour of the principal garments; but something white is, however, worn around the neck until the expiration of the accustomed period.

For a father or mother, the mourning continues for sixty days, in the province of Nagato; and for fifty at Yeddo and Osaka. For a brother, sister, or wife, they are diminished to thirty, and for a young child to three.

It is worthy of remark, as bearing on the relation of the sexes in Japan, so different to that which exists in other eastern countries, that the same rites are performed, and the same period of mourning is observed, whether the deceased relative be male or female.

The higher classes do not visit nor appear in public while mourning for their relatives, but every day go to the grave and pay the accustomed honours to the dead. The necessary occupations of the lower or working classes prevent them maintaining the strict seclusion which etiquette demands from the members of the upper ranks of society.

NAMING.

When an infant, either male or female, is about a month old, all its near relatives assemble to take it to the temple to be named.

It is not considered a feast time, although sakee and sweetmeats are handed round. The child is borne in its mother's arms, while she is conveyed in a *norimon*,

escorted by her friends. On arriving at the temple, they stand before the family shrine, and the priest places his hand over the child's head, and calls it by the name which is to individualise it, and which corresponds with our Christian name.

The names of brothers and sisters bear a certain relation to each other, being distinguished by an affix; for instance, if the name of a brother be *Yos-yero*, the sister's name will be *O-yosi*, making use of the two first syllables, with the prefix *O* to distinguish the sex.

The priests sometimes choose these names, because they are supposed to be learned in the knowledge of lucky and unlucky designations; at other times the name is selected by the parents. When a female child has been thus named, she is taken to her nearest kinsman, who gives her a shell filled with paint.

There is no religious sentiment connected with this ceremony of naming, which yet, in its outward form, bears a curious resemblance to our christening service. The family name is added to the one conferred at the temple, exactly as amongst ourselves.

WORLDLY WISDOM OF BENJAMIN FRANKLIN.

READY MONEY.—In buying goods it is best to pay ready money, because he that sells upon credit reckons to lose five per cent. by bad debts; therefore he charges on all he sells upon credit an advance that shall make up that deficiency.

KEEPING ACCOUNT OF EXPENSES.—If you take pains to write down particulars, it will have this good effect: you will discover how wonderfully small trifling expenses mount up to large sums, and will discern what might have been saved, and may for the future be saved, without occasioning any great inconvenience.

HEAVY TAXES.—The taxes are indeed very heavy; and if those laid on by the Government were the only ones we had to pay we might more easily discharge them; but we have many others, and much more grievous to some of us. We are taxed twice as much by our idleness, three times as much by our pride, and four times as much by our folly, and from these taxes the Commissioners cannot ease or deliver us.

THE WAY TO BE RICH.—The way to wealth, if you desire it, is as plain as the way to market. It depends chiefly on two words, *Industry* and *Frugality*; that is, waste neither time nor money, but make the best use of both. Without industry and frugality nothing will do, and with them everything. He that gets all he can honestly, and saves all he gets, necessary expenses excepted, will certainly become rich—if that Being who governs the world, to whom all should look for a blessing on their honest endeavours, doth not in his wise Providence otherwise determine.

CHEAP BARGAINS.—You call them "goods," but if you do not take care they will prove "evils" to some of you. You expect they will be sold cheap, and perhaps they may, for less than they cost; but if you have no occasion for them they must be dear to you. Buy what thou hast no need of, and ere long thou shalt sell thy necessities.

DOING GOOD.—"When I was a boy," wrote Dr. Franklin to Dr. Cotton Mather, of Boston, "I met with a book entitled 'Essays to do Good,' which I think was written by your father. It had been so little regarded by a former possessor that several leaves of it were torn out, but the remainder gave me such a turn of thinking as to have an influence on my conduct through life; for I have always set a greater value on the character of a doer of good than any other kind of reputation; and if I have been, as you seem to think, a useful citizen, the public owes the advantage of it to that book."

TIME IS MONEY.—He that can earn ten shillings a day by his labour, and goes abroad, or sits idle one half of the day, though he spends but sixpence during his diversion or idleness, ought not to reckon that the only expense; he has really spent, or rather thrown away, five shillings besides.

BUNYAN'S PILGRIM'S PROGRESS.—Honest John is the first that I know of who has mixed narrative and dialogue together, a mode of writing very engaging to the reader, who, in the most interesting passages, finds himself admitted as it were into the company and present at the conversation. De Foe has imitated it with success in his "Robinson Crusoe," and other works, as also Richardson in his "Pamela."

WATER OR BEER?—I drank nothing but water. The other workmen (at Watts's printing-house, near Lincoln's Inn Fields), to the number of about fifty, were great drinkers of beer. I carried occasionally a large forme of letters in each hand up and down stairs, while the rest employed both hands to carry one. They were surprised to see, by this and many other examples, that the American Aquatic, as they used to call me, was stronger than those who drank porter. The beer boy had sufficient employment during the whole day, in serving that house alone. My fellow-pressman drank every day a pint of beer before breakfast, one between breakfast and dinner, one at dinner, one again about six in the afternoon, and another after he had finished his day's work. This custom appeared to me abominable; but he had need, he said, of all this beer in order to acquire strength to work. Every Saturday night he had to pay a score of five or six shillings for this cursed beverage, an expense from which I was wholly exempt.

HOW TO BORROW £100.—For £6 a year you may have the use of £100, provided you are a man of known prudence and honesty. He that spends a groat a day idly spends idly above £6 a year, which is the price for the use of one hundred pounds. He that wastes idly a groat's worth of his time per day, one day with another, wastes each day the privilege of using one hundred pounds.

EARLY RISING.—How much more time than necessary do we spend in sleep! forgetting that "the sleeping fox catches no poultry, and that there will be sleeping enough in the grave." Sloth makes all things difficult, but industry all easy. He that riseth late must trot all day, and shall scarce overtake his business at night; while laziness travels so slowly that poverty soon overtakes him, as we read in poor Richard, who adds, "Drive thy business, and let it not drive thee; and early to bed and early to rise makes a man healthy and wealthy and wise."

WASTING TIME.—Dost thou love life? Then do not squander time, for that's the stuff life is made of. If time be of all things the most precious, wasting time must be the greatest prodigality. Lost time is never found again, and what we call time enough always proves little enough. Let us then be up and doing, and doing to the purpose.

PRIVATEERING.—The United States of America, though better situated than any European nation to make profit by privateering (most of the trade of Europe, with the West Indies, passing before their doors) are, as far as in them lies, endeavouring to abolish the practice, by offering, in all their treaties with other powers, an article, engaging solemnly, that, in case of future war, no privateer shall be commissioned on either side; and that unarmed merchantmen on both sides shall pursue their voyage unmolested. This will be a happy improvement of the law of nations.

DEISM.—I soon became a perfect deist. My arguments perverted some other young persons, particularly Collins and Ralph. But in the sequel, when I recollected that they had both used me extremely ill, without the smallest remorse; when I consider the behaviour of Keith, another free-thinker, and my own conduct, which at times gave me great uneasiness, I was led to suspect that this doctrine, though it might be true, was not very useful.

DIVINE PROVIDENCE.—Let me with all humility acknowledge that to Divine Providence I am indebted for the felicity I have hitherto enjoyed. It is that Power alone which has furnished me with the means I have employed, and that has crowned them with success. My faith in this respect leads me to hope, though I cannot count upon it, that the Divine Goodness will still be exercised towards me, either by prolonging the duration of my happiness to the close of life, or by giving me fortitude to support any melancholy reverse which may happen to me, as to many others. My future fortune is unknown but to Him in whose hand is our destiny, and who can make our very afflictions subservient to our benefit.

Varieties.

THE ATLANTIC TELEGRAPH.—At an anniversary banquet given by Mr. Cyrus Field at the Buckingham Palace Hotel, London, the western telegraph lines were brought into the room and messages interchanged with America; these messages were delivered at their respective addresses, and the replies to them were received back in the room in the following periods:—From the President at Washington, two hours 10 minutes; from Mr. Seward at Washington, two hours 25 minutes; from several persons in and near New York, average one hour 45 minutes; from the Governor of Cuba, who apologised for the delay caused by his residing at a distance from Havannah, two hours 24 minutes; from the Governor of Newfoundland at St. John's, 38 minutes; and from Heart's Content, Newfoundland, 6 minutes. But even these performances are thrown into the shade by an ordinary message sent from London to San Francisco on the 1st of February. The wires in America were joined up for experiment from Heart's Content to California, and the message was sent from Valentia at 21 minutes past 7 in the morning; the acknowledgment of its receipt was received back in Valentia at 23 minutes past 7, the whole operation having only occupied 2 minutes; the distance travelled was about 14,000 miles, and the message arrived, according to San Francisco time, at 20 minutes past 11 on the evening of January 31, or the day preceding that on which it left England.

ABD-EL-KADER.—The most recent intelligence about the great Emir occurs in a letter from Eli Jones, an itinerant Friend:—"The day previous to our leaving Damascus it seemed right to seek an interview with this noble exile, and from a full heart, in my own name and in behalf of my country and fellow-professors, thank him for his kind and humane interposition, by which, under Providence, so many fellow-beings were rescued from an untimely and cruel death during the massacres in 1860. Passing up the street upon which the house of the great chief stands, and having Abou Ibrahim, a Jew, for guide (who, by the way, claimed descent from Aaron), we observed Abd-el-Kader enter the gateway just before we reached it, where he was standing when we arrived. Our guide having addressed him, he kindly noticed A. L. Fox and self, and, beckoning us to follow him, led us into a simple reception-room, where, being seated, we had the opportunity of saying what lay nearest our hearts, and enjoyed the pleasure of feeling that it was kindly taken. Before leaving, coffee was brought—the universal token in the East of hospitality and friendship—and as we drank and spoke kind words each to the other through the medium of the Arabic, German, and English (having to use all three languages), the Jew, the Mohammedan, and the Christian felt that there is deep down in human hearts a sympathetic cord that binds man to man, and that, whatever may be our nationality or creed, we belong to a great brotherhood which embraces all, peoples, and whose God is the Lord."—*The Friend*.

ROYAL LITERARY FUND.—At the last annual meeting, Earl Stanhope presiding, it was stated that the sum of £784 had been produced during the year in dividends from the permanent fund. The permanent fund now amounted to £26,300, producing an annual dividend of £789. The stock of the Newton property consisted of £8,167 in Three per Cents. Reduced, producing an annual dividend of £245. The sum received in rents during the past year, including a quarter's rent under the new lease of the Newton estate, amounted to £274 5s. The grants awarded in 1867 numbered 43, and amounted to £1,270. The grants were classified as follows:—History and Biography, 6; Biblical Literature, 1; Science and Art, 6; Periodical Literature, 2; Topography and Travels, 5; Classical Literature and Education, 4; Poetry, 6; Essays and Tales, 7; Drama, 2; Medicine, 1; Law, 1; and Miscellaneous, 2. Nineteen authors had been relieved for the first time, six for the second, two for the third, eight for the fourth, three for the fifth, one for the seventh, one for the ninth, and three for the tenth time. Of these 27 were males and 16 females. Of the latter six were actresses, six widows, and four orphans. There had been awarded four grants of £10 each, three of £15 each, six of £20 each, six of £25 each, two of £30 each, eight of £40 each, seven of £50 each, one of £75, and five of £100 each.

TRADE WITH JAPAN.—On New Year's Day, 1868, the ports of Hiogo and Osaka were formally opened to European traffic.

Osaka, one of the five imperial cities, is situated in Nippon, on the banks of the river Jodogawa, at the north-eastern extremity of the inland sea. No vessels larger than barges can approach within two miles of it. It is intersected by canals cut from the river, deep enough to be navigable by small boats, which bring the goods to the merchants' doors. Upwards of a hundred wooden bridges, many extraordinarily beautiful, span these channels. The town is certainly the most important commercial *entrepôt* in the empire. It abounds in manufactures of every kind, and is also the resort of rich people from all parts of the country, who are attracted by the numberless theatres and other diversions which have made some writers call Osaka the Paris of Japan. It is also celebrated as being the place where the best *saki* is brewed. This, the only intoxicating liquor made in Japan, is sent to all parts of the empire, much as Burton ale is with us. It is very superior to the *samsu* of the Chinese, but latterly many of the princes have taken to bitter beer and champagne. Hiogo, also a large and important city on the sea-coast, about eighteen miles from Osaka, possesses the inestimable advantage of good and secure anchorage for ships of any size and in any numbers, at a short distance from the shore. It is built on a plain between the sea and the mountains. A London or Liverpool merchant, hearing of the opening up of a new country, is apt at once to suppose that he will find for his goods a new market there. But really it is difficult for any one who knows the Japanese to believe that any trading of much consequence will be carried on with them, at any rate for a long time to come. A few articles of *luxe* for the very upper classes, with which, by the way, the markets out here have been literally deluged lately, are all we can expect to sell them. All the things of every-day use and consumption they make cheaper and very often better than we do. No doubt some day, when the enormous mineral wealth of the country is developed by the employment of European skill and capital, Japan may become of the very last importance to us. But that will hardly be in this generation. At present a few bales of silk, a few loads of timber, and certain bronze and china curiosities are about all she is likely to give us.

FIDDLE AND HARP STRINGS.—The manufacture of strings for musical instruments has been carried on from time immemorial in some of the small villages in the Abruzzi, and at the present time the Neapolitan provinces maintain their superiority in the production of this article. They require the greatest care and dexterity on the part of the workman. The treble strings are particularly difficult to make, and are made at Naples, probably because the Neapolitan sheep, from their small size and leanness, afford the best raw material. They are made from the small intestines, which must be very carefully scraped; the intestines are then steeped in alkaline leys, clarified with a little alum, for four or five days, until the guts are well bleached and swollen. They are next drawn through an open brass thimble, and pressed against it with the nail, in order to smooth and equal their surface; after which they are washed, spun or twisted, and sulphured during two hours. They are finally polished by friction and dried. Sometimes they are sulphured twice or thrice before being dried, and are polished between horse-hair cords. The strings manufactured in Italy are noted for their strength, transparency, brilliancy, and clearness of tone. The manufacture was introduced into France by a Neapolitan nobleman, in 1766, who established a manufactory at Lyons. This industry is carried on in various other towns in Italy, namely, Gobbio, Foligno, Bologna, Venice, Vicenza, Padua, Verona, and Bassano.

LIFE INSURANCE IN THE UNITED STATES.—A recent compilation of insurance statistics gives the following interesting facts:—On the 1st of January last, there were in existence in the United States, 55 life insurance companies, and 5 branch offices of foreign companies. The number of policies in force at the beginning of the year was 352,131, and the total amount insured was 976,431,560 dols. 11 cents. The total assets were 112,211,771 dols. 37 cents. Twenty-four of these companies are located in New York, 17 in the New England States, 5 in Pennsylvania, and the remainder scattered throughout the Western States. Of accident and casualty companies there are 10. The number of policies in force, 433,775; the amount insured, 1,195,583,205 dols. 11 cents; and the assets, 114,763,233 dols. 82 cents.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Corper.*

A TALK WITH THE OLD HOUSEKEEPER.

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER XXXIX.—IN WHICH MARY TALBOT DISCOVERS HER BROTHER'S OLD SCHOOLFELLOW.

MR. SHARPE returned to his lodgings after his interview with Mary Talbot in the lane, in no very happy frame of mind. He felt that he had acted ungenerously towards her. He had almost urged her to confide to him the cause of the apparent change in her manner towards himself, and after he had declared the impossibility of any alteration taking place in the feelings with which he regarded her, he had shrunk from her, as it were,

as soon as the first breath of calumny approached her. He was angry with himself, angry with the idle gossips of the village, vexed with his mother for having listened to the tales of her servant-maid, and vexed with Mary, he could hardly say why, unless it were because she had confessed to the truth. He felt that she was right when she intimated that she knew *him* better, in one respect at least, than he knew himself, and that, however confident he might be in his own strength of purpose, he would be unable to breast the tide of calumny or suspicion, if it assailed him through the woman whom he had made his wife.

"It would be a terrible thing," he thought to himself, "to be the husband of one against whom, however innocent she might be, the finger of doubt, suspicion, or scorn were pointed. It would be ruinous to all my hopes of advancement. I might as well retire at once, and hide myself from the world." And then, when he had reflected upon all the evils that such an union would bring upon him, a change came over him, and he fancied that he could willingly dare all these evils—that he could bear up against them and outlive them—anything rather than separate himself for ever from the object of his affections, and from one who was, so far as she herself was concerned, worthy, as he believed, to be the chosen helpmate of the best man living.

They were both young—himself and Mary; the world was all before them. Why need they remain in England? They might emigrate to the colonies, where there was a wide field of usefulness open to them, and where neither the breath of suspicion nor calumny could reach either of them.

He had been restlessly pacing to and fro in his room. He now sat down and wrote a note to Mary, assuring her that the confidence she had reposed in him, the candid acknowledgment she had made, and, more than all, the opinions she had expressed, had but increased the affection and respect with which he regarded her, and begged her to rescind her resolution, and let matters be between them as they formerly had been. He wasted many sheets of note-paper before he was able to frame a letter to his mind. Even at last he was dissatisfied with what he had written; but he felt that he was utterly unable to express himself as he wished. He sent the letter off by a messenger that night, and then thought how he should write to his mother, and explain all that had passed between himself and Miss Talbot, and acquaint her with the determination at which he had arrived. This he felt would be as difficult a task as that which he had so feebly accomplished, but it was one that could be postponed, at least, until after he had received Mary's reply; and, glad at the respite he had given himself, he retired to rest.

He received a reply to his note before he was up in the morning.

Mary wrote that she had received his note, and had been surprised, as well as pained and pleased, with its contents. She expressed her gratitude for the estimation in which he held her, but added that it were better for the happiness of both, that matters should remain as they were between them. She intimated that the determination at which she had arrived had not affected her feelings towards him, and that it was not impossible that circumstances might arise which would induce her to rescind her resolution; but the time when those circumstances would occur might be far distant—perhaps it might never come—and meanwhile she felt that it were better that he should hold himself free to act as he thought fit, without regard to her; and she ended by saying that, whatsoever the future might have in store for either him or her, for weal or woe, she would ever pray for his welfare and happiness, and, so long as she lived, would look upon him as a valued and respected friend.

Cold and distant as Mary's letter appeared to him who received it, it had caused her much pain and many tears to write. It had seemed to her as though she were wilfully casting from her her only hope of earthly happiness, and yet she felt that was but doing her duty to herself, as well as to him whom, for a brief period, she had regarded in the light of her future husband.

None save Mr. Sharpe and herself knew what had passed between them. None others knew the pain which each felt whensoever they met, as they were compelled to meet, almost every day, and sometimes several times in a day.

Time wore on: and, though the looked-for American packet arrived and brought no reply to Mr. Aston's letters asking for correct information respecting the rumoured arrival at New Orleans of the pinnacle of the lost ship Amazon, with several of the crew and passengers who were believed to have perished, Mary still continued to be supported by the secret hope she so strangely cherished.

If less cheerful than she had formerly been, she appeared to her friends to submit herself with calm resignation to the irremediable loss she had sustained; and no one even suspected that another secret sorrow was rankling at her heart, though, at this period, she and the curate were—as in after days they frequently acknowledged to each other—probably the most unhappy youthful pair in the village or parish of St. David.

Another month passed away, and towards its close old Mrs. Margaret came from Hammersmith to pay a long-promised visit to Mary Talbot. The old *ci-devant* housekeeper had heard from Mary all that she knew respecting the loss of the Amazon, and it was the old lady's earnest yearning to comfort her former mistress's child in her affliction which had induced her, at her advanced age, to undertake the long journey from London to Cornwall, at a period when travelling was much more tedious and wearisome than it is in these later days.

The day before Mrs. Margaret's arrival, however, the American mail-packet again came into Falmouth, and on this occasion it brought letters to Mr. Aston from his friends at New Orleans and St. Louis, as well as from his son and daughter at Watertown.

There was no longer any doubt about Henry Talbot's escape from the perils of the deep. The New Orleans merchant, who had been absent from that city when the miserable remnant of the pinnacle's crew arrived, knew nothing more than he had learnt from the British consul at that port; but the merchant at St. Louis spoke of Henry's arrival and temporary sojourn in that city, and subsequent departure for Watertown. He alluded also to the apparent mystification in the mind of the young Englishman, who spoke of Mr. Morton as Mr. Aston.

"I did not deceive him," the merchant went on to say, "as I supposed that you had some motive in assuming in England the name of your deceased father-in-law. He must, however, have found out his mistake on his arrival at Watertown, whither he went to visit your son and daughter."

A perusal of the letters from Henry and Mary Morton proved to their father, however, that though Henry must have discovered that he (Mr. Aston) had assumed another name in England, he had kept this knowledge to himself; though Mr. Aston (as I must still style Mr. Henry Morton) was unable to discover, from anything in his children's letters, whether Henry Talbot had any notion of his relationship to his cousins.

This, however, was now a matter of little consequence. He was rejoiced to learn that his nephew still lived, and his first thought was how—upon his return from Falmouth, whither he had gone, as usual, to receive his letters from the postmaster—he should break the happy intelligence to his niece.

There was no cause for anxiety on this score, however. The same mail brought Mary a letter from her brother

—the letter with which the reader is acquainted, and which was written after Henry had obtained employment as purser on board the Franklin.

It is needless, as it would be vain, to attempt to describe the mingled emotions of joy and thankfulness which filled the soul of the young lady on the receipt of this letter. The strange hope, almost amounting to a belief, that her brother had escaped the perils of the sea, if it had not its origin in her knowledge that her uncle had, more than once or twice, escaped from similar dangers, and had at length returned to England in safety after many years of wandering, had been greatly strengthened by this remembrance. Still it had at all times been mingled with doubt; and sometimes—when she was alone in her room at night, and the wind howled and the rain fell around the farmhouse, and the mournful murmur of the storm-lashed sea sounded in her ears—had been almost overshadowed by despair. But now she was assured of her brother's safety, and in her heartfelt gratitude to the gracious Providence that had protected him amid all her hopes and fears, she forgot for the time being all that was unsatisfactory in the letter, she forgave Henry for his cruel silence maintained for so many months, and rejoiced in the one great fact that he was still living, and now prospering.

It was not until she had read the letter three or four times over that she felt her gladness clouded by doubts and anxieties. She had often thought that if her hopes of her brother's escape were ever to be realised, and she were to receive a letter from him, how proudly she would show that letter to her uncle, as a vindication, in itself, of Henry's innocence. She had fancied herself saying—"Read what my brother—your nephew—has written, and then say whether any one with the dark shadow of guilt upon his soul could write in such a strain!" Then, too, she would also say to *him* who, in spite of her resolve to think of him only as a friend, still constantly occupied her thoughts, and whose every word and look was stored in her memory—

"Alfred, the dark shadow that came between us and shrouded our future hopes in gloom is removed, and we may be again to each other as we have been."

Could she do this now? No. Her brightest hope had in one sense been realised; but the letter that she had sometimes feared that it were madness to hope for, had not brought the assurance she had anticipated. On the contrary, it almost dealt a fatal blow to her own secret assurance of her brother's inability to commit the grievous sin of which she knew him to be suspected by the two persons who were nearest and dearest to her.

When, after her first overpowering emotions of joy and gratitude, she was able calmly and understandingly to read what her brother had written, she blamed the spirit of pride which, under the flimsy excuse to his conscience that he was saving her from a renewal of her grief, had led him to conceal from a loving sister his providential escape from death, rather than acknowledge to her the wreck of the sanguine hopes with which he had left her; but still felt that he wrote with the guileless frankness of one whose conscience was not burdened with the consciousness of guilt, until she came to the passage in which he spoke of the hardship and misery he had suffered, as being a judgment upon him for his wrong-doing; of his present inability to make restitution to him from whom he had obtained the money he had lost, and his satisfaction in the confidence he felt that he would not be put to any trouble through what he had done, until the time came when he might be in a position to restore the two hundred pounds.

So Mary understood her brother's words, and though she could not yet make up her mind to believe him guilty, though she yet forced herself to believe that there was some mystification in the matter which she could not comprehend, she was shocked by the equivocal manner in which—if his words had the meaning in which she felt they would be read by all but herself—he spoke of a base and terrible misdeed.

She hardly understood the remainder of the long letter, although she read it to the end. If she had been asked what her brother had said about the son and daughter of Mr. Aston, she would have been unable to explain. She did not even remark that, though Henry must have been aware that Aston was an assumed name, he had studiously avoided any allusion to the fact; all her thoughts, all her faculties, were concentrated upon the passage in the letter in which Henry spoke regretfully, and yet with a strange apathy, of some wrong-doing for which he had to make restitution; and in the first bitterness of her heart she felt that she would much more gladly have received confirmation of her brother's death, if at the same time she had obtained evidence of his innocence of crime.

Then she blamed herself for her readiness to place the worst construction upon her brother's words, and tried to believe that he alluded only to his inability to repay the money he had borrowed.

"Perhaps," she thought, "in his sanguine expectation of immediate success, he spoke of soon being in a position to repay the loan, and now regrets that he raised those expectations of speedy repayment in the mind of the lender? It must be so. Surely he would never have written thus—to *me*, had he any other meaning."

She took up the letter to read it again, at the moment when Mr. Aston (as I must still style him) called at the farmhouse to break to her the news he had received of his nephew's escape from the perils of the sea, and of his visit to his unknown cousins at Watertown.

Mr. Aston had dreaded the excitement that his news would occasion; but a few words of explanation gave him to understand that Mary herself had received a letter from her brother, and that she was already aware of all he had to acquaint her with.

After he had expressed his congratulations, therefore, he spoke at once of Henry's visit to his cousins.

"It is very strange," he said; "but neither my son nor my daughter appear to entertain any notion that Henry is their cousin; and yet they must have spoken of me to your brother by my proper name. *They* had no idea that I had assumed the name of Aston on my arrival in England; nor do they appear to have learnt from Henry that such is the case. Henry himself must, from what they have told him, have surmised that I am his lost uncle Henry. Yet he has concealed his knowledge from them. Perhaps he has explained his reasons for this reticence to you?"

Thus questioned, Mary was under the necessity of reading more attentively the latter portion of her brother's letter. Gladly would she have handed the letter to her uncle to read, but for the mysterious passage which she was resolved no eyes should see but her own. However, she read aloud her brother's account of his visit to Watertown, greatly to Mr. Aston's delight, and not a little to her own satisfaction, inasmuch as it now appeared evident to her that, had Henry been guilty of such base conduct towards his uncle, as his words would, she feared, imply to the minds of others than herself, he could not have written of his visit to Watertown as he had done. He would, in fact, have avoided the place altogether. His letter, however, gave no inti-

mation of his knowledge of the fact—which he must have been aware of—that his friend, Mr. Aston, of St. David, was really Mr. Henry Morton, or that he had any idea of the relationship that existed between himself and Henry and Mary Morton.

Mary and her uncle both wondered at this.

"The boy *must* have some suspicion of the fact that I am his long-lost uncle. He could not have lived for a week with his cousins without hearing enough—if he have any knowledge whatever of his mother's family—to satisfy him that such must be the case. Had I not believed him dead, I should ere now have written to my children to explain the facts to them. I intended to do so when Henry left England, in order that they might have been prepared to receive him as their cousin. I thought it needless, afterwards, to explain to them the reason why I had adopted their mother's maiden name. Perhaps, however, it is as well that Henry has kept his suspicions to himself. It shows good sense in the boy. He naturally supposed that I had some good reason for acting as I have done, and he has done well in leaving the explanation to me.

"However, my dear Mary, whatever suspicions may have clung to me, in spite of my efforts to banish them, I feel satisfied now, from the manner in which Henry writes, that he is entirely innocent of crime. There is some strange mystery connected with the loss of my pocket-book, and your brother's possession of the locket; but I entirely acquit *him* of all knowledge of the matter. So set *your* mind at ease on that point. Let nothing damp the joy you feel at the happy escape of your brother from the perils of the deep."

Mary's eyes filled with happy tears as she took the hand her uncle held out to her as he rose to return to Cliff Cottage. She was unable to reply save by an eloquent look, which spoke more than words; but she felt as if a great burden of shame and sorrow were lifted from her mind. Her uncle believed, as she did, that her brother could not have visited Watertown, and could not have acted or written as he had, if he had felt the burden of a guilty conscience. Still she would have been glad if the mysterious words towards the end of the letter had been left unwritten.

Mr. Aston did not remain long. On such a happy occasion he judged that his niece would rather be left alone to her own thoughts; and, with a gentle pressure of the hand he had all along held in his own, he bade her good-bye, and returned home.

Early the next morning Mrs. Margaret arrived at St. David, and was joyously welcomed by Mary.

The good old lady, who had come expressly to condole with the daughter of her beloved mistress of former days, was equally rejoiced and surprised to hear the happy news that Mary had to tell.

"You must write down, my dear, where Master Henry be livin' in 'Meriky, so's I may give directions to the young gentleman when next he comes to my place to ask after your brother," she said, when she and Mary had talked for some time over Henry's past mishaps and present prospects.

"A young gentleman has called at your cottage to inquire after Henry, she exclaimed. "Who is he? What is his name?"

"Well now, my dear," returned the old lady, "I disremember just now. I 'ave sich a bad memory. But he 'ave called twice, and the last time he asked me where Henry's sister lived, that he might write to her, and ask her about her brother. In course I wouldn't tell him that till I got leave from you, though he be quite a gentleman, for sure; and 'an'some and well-spoken as

any young man I ever see. Howsomever, I 'ave his card in my box."

"When did he call to make these inquiries?"

"On'y o' late, my dear. He said how he'd a been travellin' abroad, and on'y heard when he came home of the loss of the Amazon. He be gone away ag'in for a short time; but he said as he should call as soon as he came back, to ask if I'd a' got leave for him to write to *you*."

"But what can he want to know that I can tell him?"

"I can't say, my dear; on'y he 'peared to be much cut up about poor Master Henry's misfortun's. He said as he'd been a favourite schoolfellow of Henry's at Eton, and I mind, when Master Henry called to see me at Hammersmith afore he went back to St. David, this same young gentleman, whom he'd been visiting, came with him to the garden gate, where he bid him good-bye, and a pleasant v'yage—poor fellow!"

A sudden light broke upon Mary. She felt her heart leap in her bosom. This stranger was the mysterious schoolfellow at Eton, whom her brother had come across in London. It was he who had invited Henry to visit him, and it was he who had lent Henry the money which had been productive of so much misery to herself.

"Go on. Tell me all about him, my dear Mrs. Margaret," she cried impulsively. "Tell me all he said about my brother."

"He said nought but good, my dear," replied the old lady, mistaking Mary's excited manner for alarm. "I never see a nicer young gentleman, on'y a year or so older than Master Henry hisself. Though, in course, as I 'ave said, I wouldn't tell him where *you* lived till I had your leave."

"I wish you *had* told him. I must write to him immediately. You say you have his card in your box? You must let me see it. Oh, how I wish I had known of this before!"

"Twon't be no use writin' immediate, my dear," replied Mrs. Margaret, much amazed at the young lady's impetuosity. "He 'ave gone away abroad ag'n, I don't know where. Howsomever, I'll get the card, and if you write I'll give him the letter when he comes ag'in, arter I go 'ome. He said he'd be sure to call."

"When? How long will he be away?" inquired Mary.

"About two months, he *said*, my dear."

"The better plan will be for me to write to the address on his card; the letter will then, in all probability, be forwarded to him, wherever he may be."

Mary put numerous other questions, to which, however, Mrs. Margaret was unable satisfactorily to reply. The old lady had simply replied as best she could to the questions the young gentleman had put her, and had asked none herself; but she manifested so much surprise at the young lady's anxiety, that Mary, who did not care to conceal anything from her, related to her the story of the theft of the pocket-book, of which she had hitherto been ignorant, and spoke of the misery and anxiety she herself had suffered in consequence of the suspicions which had lighted upon her brother.

In Mrs. Margaret, Mary found a warm supporter of her brother's innocence. The old lady declared that it was impossible that Henry could be capable of such wickedness, and agreed with the young lady that it was advisable to write to the young gentleman immediately. She commenced at once to uncord her box that she might find the card which bore the gentleman's name and address, and while she was thus employed launched forth upon another topic of conversation.

"My dear," she went on; "if I didn't know as 'twere impossible for sperrits to return to this earth in their nat'ral form, and if 'twere n't sinful to believe in sich things, I'd have sworn as I seen Squire Morton, your grandpa, who died afore you were born, this very mornin', as I were gittin' down from the kerrage as brought me from Falmouth. 'Twere the very spit on him, as he were, as I recollect him, though as I came closer to him, I see as he were some years younger than the squire was when he died. But he were standin' with his hands in his pockets looking out of the garden gate, just as the old squire used to stand. Never, in all my life, did I see such a likeness. He had your grandpa's walk and look and everything."

Mary knew at once to whom her visitor alluded. Without replying, she went to her desk, drew forth the locket her brother had given her, and placed it, open, in the old lady's hand.

"Do you know whose likeness that is?" she asked.

The old lady carefully adjusted her spectacles; but no sooner did her glance rest upon the miniature than she exclaimed—

"It is your own dear ma' when she was a child!" Again she gazed at the portrait, and then, with a bewildered look, as if she thought it was not real, or that she herself was dreaming, she examined the case.

"This locket, sure as I live, belonged to your mamma," she went on. "How did you come by it, my dear? It were given by your mamma, when she were a little girl, to her brother Henry—your poor uncle who was lost at sea. Many's and many's a time have I hung this round your poor mamma's neck! Sure I am not dreaming?"

"No, dear Mrs. Margaret," replied Mary, "you are not dreaming. It was not indeed my grandfather Morton whom you saw," she went on with a smile, "but my uncle Henry, who, as you know, was supposed to have perished at sea when a boy. He was saved by the French sailors, and put in prison, and has lived many years abroad. At length, about ten months since, he returned home to England. You shall hear all about his return by and by. The locket I have shown you has been the cause of all my pain and misery. My uncle treasured it carefully for mamma's sake, and brought it home to England with him. It was lost with his pocket-book, and subsequently purchased and given to me by my brother. Where Henry purchased it has yet to be explained, and I am sure will be explained satisfactorily. My uncle saw it in my possession, and was naturally surprised and grieved; but he has now given it to me, and I hope that all will soon be made clear, for dear Henry's sake. Now, dear Mrs. Margaret, you know almost as much as I do myself—though I was not aware that my uncle was so like grandpapa."

It is impossible to describe the surprise and amazement of the old lady when she heard this explanation. She was so much overcome with joy that the tears coursed freely down her still unwrinkled cheeks. Mary furthermore explained to her why her uncle had assumed the name of Aston.

"He wished to keep his return secret from Mr. Foley," she said. "He may have taken secret measures to prove his identity to others, before he sees Mr. Foley. I cannot say. My uncle is very peculiar in some of his ways."

"What need of any measures being took?" said the old lady. "He 'ave but to show himself for everybody to see as he is a Morton. Didn't I reckonise him as soon as I see him?"

"Perhaps mere personal identification would be in-

sufficient in the eye of the law," returned Mary. "However, my uncle knows best his own views."

"You must let him know as I am here," said Mrs. Margaret, "I'm sure he'll come to see me directly. I wonder indeed as he didn't reckonise me, though, for sure, I be much changed."

"He was but a boy when he saw you last," replied Mary. "But, dear Mrs. Margaret, all this time we are forgetting the card!"

Thus reminded, the old lady opened her box and produced a card bearing the following inscription in old English characters:—

"SIR ARTHUR LOCKYER, BART., WINSTONE PARK, KENT."

"A baronet! So I remember Henry said," exclaimed Mary, as she eagerly seized the card. "Well, be he whom he may, I will write immediately to his address, and beg him to explain all that passed between himself and my brother."

This task, however, she found to be a more arduous one than she had anticipated. It was a difficult matter for a sister to write to a stranger and explain the suspicions which had been directed against her brother. More than once her heart failed her; but her eagerness to establish her brother's innocence beyond doubt or cavil, moved her to complete the task, and at length the letter was written and despatched to Winstone Park.

It was not until the letter had been sent away that the thought occurred to Mary's mind—

"What if Sir Arthur should reply that he never lent Henry any money?"

TRADE TRAMPS.

By trade tramps the reader will understand those travelling artisans and craftsmen who perambulate the country ostensibly in search of employment. They are an entirely distinct class from the tramps who have no trade, from whom they for the most part keep aloof, with a feeling, it may be, that too close a contact with them would lower their respectability. The tramping artisan deems the tramp who is no artisan a vagabond, and resents the notion of being mixed up in the same category with him. He will tell you sometimes that, if he takes to a wandering life, it is not because he is driven out of society, as the vagabond is, but because he elects to travel and see the world and the ways of life before he settles down to his share of its responsibilities. It is probable that he really does intend to settle down some day or other, or at least that such was his intention when he began his travels; but that idea grows less vivid, and has fewer charms for him the longer he continues on the move, and after a course of years vanishes away altogether. Meanwhile he has abundance of precedents for the life he leads—precedents older almost than any of the habits, customs, or bye-laws of the settled craftsman. Who were the Freemasons who built the cathedrals and most ancient of the churches that stud the land? What were they but tramps, who went about from place to place doing honest and skilful work where it was to be done? What was the condition of industrial artisans in the feudal and ante-feudal times? Is it not the universal custom on the Continent for apprentices to travel from country to country at work before settling in their business? Did not all trades tramp, for the double purpose of procuring work and escaping bondage, until such time as they were able to associate in guilds for their mutual protection? Answer him these questions.

The march of modern improvement has been the greatest enemy the trade tramp has had to encounter. The railway, the penny post, the electric telegraph, the introduction of gas—all these have told against him, inasmuch as they have tended to set aside and annihilate the old-fashioned deliberate methods of doing business, which assured him employment wherever he chose to accept it. Little more than a generation back, the tramping artisan and craftsman was as much an institution as the pedler was, and more so than the pedler is now. As you rolled over the hard road on top of the four-in-hand stage, you passed him, as he trudged along under his oil-skin knapsack, half a dozen times in a morning. You found him on the sunny bench in front of the wayside inn as the coach drew up to the tune of the guard's bugle-horn, while fresh horses were put to. There sat the tramp, with the identical brown jug before him which was once Toby Philpot, from which he far too often took a sip, as he stitched away at the landlord's harness or saddle-girths, or purified his creamy boot-tops, or mended the landlady's pattens, or soldered a hole in cook's stew-pan, or performed any other small but necessary function which came within the limits of his capacity, and had been set aside and waiting for him until he should make his appearance.

Then he was looked for as regularly in the small provincial market-towns as the season for his advent came round. Repairs of very various kinds had to wait his arrival before they could be done. It was the tramp who mended the umbrellas that broke down or got turned inside-out in a high wind. It was the tramp who set all the locks to rights when they had got hampered. It was he who repaired the sportsman's guns, and plugged them with new touch-holes, ere percussion caps were as much as thought of. It was he who mended the broken glass in the house-windows, where the township was too small to maintain a glazier. It was the tramp who did all the bookbinding for the country stationer, who had to wait for his coming before he could put a single volume "in hand," and who sometimes waited six months for him. It was the tramp who renewed the edge of all the town cutlery once a year; and it was he who, when the horse fair came round, made his appearance at the stithy of the village blacksmith, and supplemented the labours of that worthy at his roaring forge and sounding anvil. In a word, the artisan tramp was the supernumerary on the great theatre of labour all over the country, and had his recognised standing as such, receiving due welcome and encouragement wherever he happened to be wanted, and seldom departing without some small guerdon, even when his services were not required.

The above description is hardly applicable to the tramp of the present day. The wayside inns have been driven off the land by the railways, or they have been transformed into farmhouses. The small country towns have grown larger, and their population has doubled itself, and improved itself into a condition of self-help, which leaves fewer chances for the wandering workman. Cheap newspapers, cheap travelling, cheap postage, and cheap carriage of goods, have in a great measure made city, town, and village all one for industrial purposes, and have put a final period to the old-fashioned patience and long-suffering which enabled people to wait for month after month for the execution of their orders to tradesmen. Yet, still the tramp perambulates the country on his annual rounds. There is a charm in the nomadic life he leads, which endears it to him in spite of its contingent hardships and privations; and though he

is sometimes induced, under pressure, to give it up for a season, it is only for a season that he does so; sooner or later, the old fascinations of the sunshine, the fields, the lanes, the highroads, the bye-paths and hedgerows come back with irresistible force, and he is off again on his travels. So enduring is this propensity, that men who have tramped the country for years in their youth are known, after settling in cities and rearing families, to return to the road again in their old age with renewed eagerness and enjoyment. The most unlovely aspect of the lot these travellers endure is seen in the case of the married tramp, whom one sometimes meets footing it through dust or mud, in company with his luckless partner—she carrying the family wardrobe and household properties in a huge bag on her back, while a wretched child drags at her skirt—he leading the way, with his packet of tools strapped to his shoulder. These dreary spectacles, which are all too common, are not, we may be pretty sure, the result of choice, but are rather the outcome of misfortune or misconduct, or both.

We think it would be found, if investigation could be made into the subject, that in point of education and intelligence the average tramp is entitled to rank considerably above rather than below the average settled workman. Such, at any rate, is the teaching of our own experience in connection with them. We once met with one who had written in large letters the words "*Pauper et Pedester*" on a strip of paper round his wreck of a hat, thus challenging, as it were, a conference in the Latin tongue; and we had reason to know that the challenge was not altogether a vain boast, seeing that he could hold a conversation in a species of monkish Latin, and was only too voluble in displaying his learning. On general subjects, moreover, the tramp is usually well informed, and is a much better authority on all social matters affecting his class than the stay-at-home workman. This, of course, is due to his wandering life, and the exercise of observation, a faculty which he has in some degree of perfection, and does not suffer to lie idle. Although with him work is never an instinct or a passion, as it is with the thorough workman, he yet really values his working power as an available resource when needs must; and he is pretty sure to make himself master of all the new contrivances and appliances for facilitating his peculiar industry and the saving of unnecessary labour. It is, indeed, more to the agency of the tramp than to any other, that numberless novel contrivances and petty inventions become so speedily diffused among the parties who profit by them.

But if the predicaments and liabilities of the tramp sharpen his wits and develop his intellect, it is to be feared they are not so favourable to the growth of his moral character. To say the truth—and we say it very unwillingly—the tramping workman is to be by no means generally relied on, whatever his promises and protestations. Very often it happens that when, with a dolorous voice and still more dolorous face, he makes application for work, there is nothing farther from his intention than performing the work you offer him. It is usually about sundown that he applies to you for employment, when he has just come off the road from a long day's march. You see that he is coated with dust or mud up to the knees, and his weatherworn face is grimed and moist with perspiration: he pleads his weariness, his hunger, and his empty pockets, and begs for the advance of a few shillings to provide him a supper and a bed, that he may rest and recruit himself and come fresh to his labour on the morrow. If you are young in the ways of the world you accede to his re-

quest, handing him over the sum he asks for, and he bids you good-night with the warmest expressions of gratitude. But that is the last you see of him. Long before you are down in the morning he is off again on his travels, and, by the time you are looking for his appearance in your workshop, is probably breakfasting heartily in your county, some ten or a dozen miles off. This is bad, but, in the case of many of this class, it is far from being the worst that might happen. There is always a risk in introducing a tramp into your workshop, especially among young apprentice lads, whom he may chance to infect with low drinking habits, to say nothing of worse vices peculiar to large towns and cities. Not unfrequently, too, it will come to pass that a tramp will undertake work which he is quite incompetent to complete in a workmanlike manner; his deficient ability may not be discovered for weeks, and in some trades for months, and when it becomes too glaring to be any longer concealed, the defaulter takes himself off on pay-night, to be heard of no more. In such a case the employer has to send for a skilled workman and pay him a high wage for repairing the mischief or completing the unfinished work of the "scamp."

Writers on industry and industrial subjects have regarded it as an anomaly that the tramp, whatever his trade, should be recognised, and to a definite extent encouraged by the regular settled workmen, and they sometimes call upon the latter to cast him off and disown him altogether. But there are two sides to this question. Under trade regulations, not of a written and documentary, but merely of a traditional kind, but which have yet been in force time out of mind, the tramp has privileges which he can claim, and does claim, it is to be feared, much oftener than he should by prescriptive right. Thus, in any town which lies in his route, if, on applying for work at all the workshops where his craft is exercised, he cannot obtain any, he can, if he chooses, send in a petition for assistance at any establishment where journeymen are employed, who, by the regulations of the trade, are bound to contribute something towards his necessities. In small country towns the tramp very rarely has recourse to this method, for two reasons: in the first place, he would gain little or nothing by it, for the contributions might not be enough, or more than enough, to pay his expenses while waiting for their collection; and in the second place, his petition would have a damaging effect in case he should return to the town at any future time. In large cities the case is different; so that a tramp who is indisposed to travel may subsist for a considerable time upon contributions which custom allows him to lay upon the journeyman in regular employment. He runs the risk, however—though, to be sure, the risk is small—of being offered work when he only wants alms, and when this occurs he has no other alternative than to work for his living or to bid a hasty and long farewell to the place. We have known him in such a dilemma to accept the employment offered, and to find himself afterwards quite incapable of working at the trade to which he had served his apprenticeship, owing to long disuse and forgetfulness of the very first principles of his craft. This inaptitude rarely brings him reproach beyond what may be couched in a sly joke or phrases of affected commendation; and the regular hands, for the most part, allow him to work on, and to recover his skill if he can, and to profit by such small gains as he can make shift to earn. The cause of the general tolerance of the tramp among workmen may be safely referred to a certain sympathy they entertain for him. Most working men have a secret longing for a

change of scene, and would themselves like well enough to go forth on the tramp, were it not for domestic reasons, and for the privation and loss of social position which such a life entails. Furthermore, every man who lives by his labour feels that it is at least within the limits of possibility that he may some day or other be forced to "tramp it," whether he choose or not; and lastly, all workmen know that if there were no tramps there would be far more competition for regular employment, and that, therefore, these wandering hands do indirectly tend by their wanderings to increase the money value of the services of the settled workers.

Winter is the worst season for the tramp. At the fall of the year he is generally not merely willing but anxious to accept any country engagement which will enable him to tide over the dreary months of frost and snow; but, failing that—and for the most part he does fail—he is driven into cities for the miserable shelter and very ambiguous prospects they offer him. Thousands of this class of men turn their faces towards London about the beginning of November, and they take up their abodes in the low and wretched "Travellers'" lodgings that crowd the back streets and filthy slums, where, at the cost of a few nightly pence, paid always in advance, they are housed from the streets, and keep one another warm by their animal heat. The want and privation that some of them undergo when old age has overtaken them, and they have exhausted the unwilling charity doled out to them by the "trade," are beyond the power of language to describe. They will wrestle with nakedness and famine, and too often with the pangs of incurable disease as well, as long as a remnant of anything like life or strength is left in them, in the desperate struggle to escape from the workhouse infirmary. But it is in vain; thither they tend, through the irresistible gravitation of poverty: into that antechamber of death, leaving all hope behind, they are at length unceremoniously thrust, there to languish under the accumulating miseries of ill-usage and neglect, to be borne thence in a few days or weeks, as it may happen, to a pauper's grave.

TWO MONTHS IN SPAIN.

BY THE AUTHOR OF "A MERCHANT'S HOLIDAY."

III.

TOLEDO, CORDOVA.

WHEN we were about to leave Madrid, it became a question whether we should take Toledo *en route*. Some of my friends, who had ladies with them, objected to this arrangement on account of the miserable accommodation in that old Spanish city. I remember the "Dugald Creature's" advice—"If shentlemans want guid roads they should stop on the plainstanes o' Glasgow," or St. James's, if you like; but as I went to see Spain and Spaniards in every phase of life, whatever trifling difficulties or privations might be in the way, I very reluctantly broke from my party, and took my ticket for Toledo, which is reached by a branch off the main line direct to Seville and Cadiz. Certainly I should have lost many of the old and new characteristics of Spain if I had passed that city. I have observed that they don't hurry things in Spain: the distance is 41 miles, which occupied three hours—from 7 to 10 p.m. I found the "best hotel" a *facsimile* of that at the Escorial, and I almost lost heart before I got into bed. The night was bitterly cold, and there were only a rug and thin blanket on the bed, and, but for my good old Scottish plaid, I should have been almost frozen to death.

It is the peculiarity of this high-lying country, that the nights are extremely cold and the mid-day sun almost tropical. Next morning, by seven o'clock, the bright warm sun was shining through my little cell, and inviting me to come forth and enjoy his brightness and beauty. After trying a cup of chocolate—which seemed a mess of sugar and flour, as thick as molasses, which was too

FOUNTAIN AND ORANGE TREES, CORDOVA.

much for me—I sent for and engaged Ferman, a well-known guide, for the day, and set forth on my rambles. I should premise that this city has been the capital of four nations, and dates, I don't know how long B.C. First the Romans, followed by the Goths, the Moors, and the Spaniards. It was a favourite city with the Moors, and had then upwards of 200,000 inhabitants: it has now dwindled down to 12,000, and is almost dead and buried in its own ashes—a mere skeleton, without life or animation. I could scarcely have believed in such a picture if I had not seen it with my own eyes. The situation of the city is very picturesque. It lies in a bite of the river Tagus, three-parts surrounded with water, and on the land side is flanked by an old Moorish wall and towers. The town rises nearly 300 feet above the river, and 2,400 feet above the level of the sea, and is consequently exposed to great heat in summer and cold in winter. The river makes its way through broken cliffs of granite of the most rugged and fantastic shape, "in Nature's wildest garb arrayed." The streets are completely Oriental, and just allow room for the mule and bag of charcoal to pass through: there is room for no other kind of conveyance, and no other seems to be wanted. There are more of the old Moorish houses still standing in this city, I believe, than in any other in Spain; and you might think at times that you were walking in the streets of Cairo. Notwithstanding

its decay, there are still some noble specimens of architecture in this city. The Cathedral is the perfection of Gothic art, and in its exterior nearly equals that of Burgos. It is poorly situated and surrounded, and at first sight is somewhat disappointing; but a closer inspection of its details—its lofty and magnificent gates, ornamented with carvings and statuary—the centre tower, of 340 feet, with its light and elegant turrets, niches, and trellis-work—realises all the beauty and perfection of the best period of Gothic architecture. The interior is somewhat gaudy and over-done, but to the admirers of sacerdotal gilding and ornament there is no want of attractions. Two Jewish synagogues, of a mixed Arabic and Hebrew character, have been appropriated to Christian worship (?), and several mosques have been adapted to the same purpose. Ferman, my guide, was a violent Liberal, outside the churches, but inside he neglected no prescribed forms or genuflections, and dwelt a little longer than was agreeable on his description of the tinsel and tawdry ornaments of the altar. He seemed to have no love for the present dynasty, and spoke of "Nuestra Senora" with more disrespect than I would like to mention. It is strange that, from the simple guide to the most educated Spanish gentleman I have met, the same dislike exists to the head of the Government. The French have here, as everywhere in Spain, left traces of their vandalism and wanton destruction. One of the greatest ornaments of the city, and unique in its style and beauty, was the convent of St. John, called San Juan de los Reyes, and built by Ferdinand and Isabella. This beautiful building was blown up by the invaders, on quitting Toledo, and the débris of broken columns, statuary, and Gothic ornaments which are now lying about, would form a large and interesting museum; but

MOORISH BRIDGE AND GATE, CORDOVA.

there and elsewhere the wreck of the city lies as it was left sixty years ago. The chapel is still preserved, and is a fine specimen of the florid Gothic. A portion of the cloisters is represented in this month's frontispiece.

In the centre and highest point of the city towers the once beautiful Alcazar, the Arab term for palace or castle. The greater part of the interior of this fine building has been destroyed by fire. The Patio, with its rows of fine granite columns, and portions of the gallery, supported

wisdom of honest Sancho Panza, and thought I might discover, tending her cows, a representative of his Dulcinea del Tobosa. But a bitter cold night and a long journey before me dispelled all my dreams, and the knight and the squire and the beauty were all forgotten.

TOLEDO.

on beautiful arches, are still standing, conveying some idea of what it must have been in its massive form and pristine beauty. It is now almost a wreck, and is undergoing extensive repairs and alterations, which may completely change the character of the building. I only refer to it here to draw attention to the magnificent view that is obtained from this point of the city, the Alameda, the old gates and bridges, the granite rocks, and rugged chasms through which the foaming Tagus cuts its way.

Every one has heard of the "Toledo Blades." This great manufactory has dwindled down to a few small workshops. I visited one of these, and was weak enough to invest three dollars in an ornamental stiletto. The man laid a copper coin on a block of wood, and at one blow drove the stiletto through the metal, without doing the point the slightest injury, so finely are they tempered. I put this away at the bottom of my portmanteau, with my revolver, hoping I might never have occasion to use either of them in the way of defence.

Proceeding from Toledo to Cordova, I had to return to the junction at Castillejo, and there wait for one-and-a-half hour—from 9 to 10.30 p.m.—in a cold shade, till the next train from Madrid came up. I passed, much to my annoyance and disappointment, the classic land of Cervantes, La Mancha. I had conjured up all my early recollections of the crackbrained knight, the wit and

The morning broke with its usual splendour; the scene still looked dry and barren, save the olive trees that lined the face of the neighbouring hills. About twenty-five miles from Cordova we passed the old Roman bridge and battle-field of Bailen. I think Napier mentions this battle in 1808. It was the first and only victory the Spaniards gained over the French, and this victory was perhaps worse in its effects than a defeat. The Spaniards were so puffed up with their unexpected success, that, instead of following it up and checking the advances of the French, their general retired to Seville to chant a *Te Deum*, and "to offer thanks to the Virgin for the victory." This small success roused England to fresh exertions, and led her to pour her blood and treasure, for five long years, over the Peninsula, when her own children were starving for bread. I have nothing to say against the good and patriotic men who ruled over our destinies in those days—they acted with the light that was given them; but, *cui bono*? where now are the works of the Holy Alliance, that cost so much blood and treasure? We have a Napoleon on the throne of France, dictating to Europe; a Hapsburgh, a Pope, and "the last of the Bourbons" shaking on their thrones; and England, with a millstone of debt about her neck, from which, for nearly sixty years, we have been unable to attempt any appreciable relief.

We reached Cordova at noon, and after a late break-

fast I hired a guide and went out to explore the city. I found the same dead and decaying look, the same stagnation, as at Toledo. It is scarcely possible to believe that this was the large and beautiful city of the Moors, with nearly a million inhabitants, 600 great mosques, 4000 minarets, and 900 public baths. Making every allowance for exaggeration, it must have been a magnificent city. There are now only about 35,000 inhabitants—not a public work, or the least sign of industry; and, were it not for the great mosque, which is now their cathedral—an unrivalled specimen of Moorish art, taste, and magnificence—there is not another object in the town that is worth a day's detention. This great building must cover, with the garden or court-yard, ten acres of ground. It is divided into long and transverse aisles, with marble, porphyry, and jasper columns, from which there spring double arches. These columns attest the antiquity of the materials at least, for many are evidently the remains of Roman temples of an early date: scarcely two are alike; and, to make them fit the elevation, some are sunk in the ground, and others have an additional block to raise the capital. Here you may wander all day in the cool shade, seeing new objects at every turn, and reading, mentally, the history of this strange city for more than two thousand years, with the material evidences before you. Round the four side aisles are about forty altars, with some good pictures and a great many daubs, and any amount of bronze and gilding, which is not in keeping with the Moorish architecture around. In the centre of the building they have raised a chapel and choir in the extravagant style of Charles V., or a sort of renaissance run mad, with gilding and ornament. In one of the side altars the beautiful arabesque of the Moors is still retained in all its pristine simplicity and richly blended colours. This was the Mihrab, or recess in which the Koran was kept. In the outer court is still the beautiful garden of orange and palm trees and fountains, in which the Moors delighted, and which they understood so well how to cultivate. Ascend the Giralda, or great tower, and take a view of the country round.

I have referred to the palace, church, and prison of the Inquisition at Valladolid. Cordova had also its feast of human sufferings, "to make a Roman holiday." The Alcazar, once the magnificent palace of the Moorish kings, became the residence and prison of the Inquisition. This building lies outside the town, and, but for the associations connected with its history, we might pass it without notice; but it is one of the land-marks that indicate the ruin and downfall of Spain. I think it was Philip II., in the midst of his cruel persecution, that exclaimed, "Better have no subjects than rule over heretics." One is inclined to reverse this maxim, and say, "Better have no subjects than the poor, indolent, bigoted, and slavish remnant, a pitiful wreck of mind and matter, which he and his immediate successors have left behind them. Round the building are suspended in festoons the chains of the captives delivered from the 'Infidel Moors.' The cloisters of the convent, which are still in good preservation, are magnificent specimens of the elaborate Gothic of the fifteenth century, with their high pointed arches, rich carvings, figures, and niche-work. The garden of the old convent is now overrun with weeds, and the surrounding scene is one of decay and desolation.

Making the circuit of the city, I found, as in Toledo, a number of the old Moorish quadrangular houses, the garden of fruit trees, and fountain in the centre, in the true Oriental style. There is still a portion of the old Moorish wall standing, and a few of the mosques are turned into Christian places of worship. But here the

Mosque Cathedral forms the great object of attraction. There must have been upwards of twenty priests officiating at the altars the second morning I visited the place. They had no congregation, with the exception of a few old women, and they did not seem to pay them any attention. Each one, if I may use a profane expression, seemed to be working on his own hook.

These Cordoveses should have been sun-worshippers; for as soon as they have mumbled over the morning service, and had their late breakfast, they are off to the alamedas and plazas with a southern aspect. There they sit in their mantles, basking in the solar rays, without a book or even a newspaper, moving about or sitting on the stone benches, and looking the picture of vacancy. Lay and clerical are all sun-worshippers, as if there were no call for their efforts in this world. I confess I have some sympathy with their love of outdoor enjoyment. The warm, genial sun at this season, and the bright blue sky, would draw forth the severest anchorite from his cell to worship at this glorious shrine. When you have seen the old Roman bridge, and the Doric gate, called Roman, but of the period of Philip II., there is scarcely anything else to detain you. It is very disappointing to have all your reading and early romance dispelled in a few hours, and to see before you such a picture of desolation. During the prosperous and active period of the Moors, there were in Cordova three handicrafts alone—viz., dressers of Morocco skins and other leathers; workers in silver and filigree, and transcribers of scientific books, who amounted to nearly as many as the present population of that city. An Arab writer of that period says, "This city and its suburbs is six miles by twenty. This great space is covered with houses, palaces, mosques, and gardens spread along the banks of the Guadalquivir. In all the west there is no city compared to it, either for population, extent, markets, religious edifices, or number of baths and inns." This was the Cordova of the Moors; what the Austro-Spanish sovereigns, the chivalry of the court, and the *auto de fé* of the Inquisition has made it, is one of the saddest chapters in Spanish history.

THE MINT.

In a recent number (p. 193, No. 848), we gave the coinage of the Mint for the year 1866, in gold, silver, and copper.* During the year 1867 no gold coin was issued, a fact unprecedented in the history of the Mint. It was thought, after the panic of 1866, that more money would be required, but so far from this being the case, not only was there no call for gold, but the demand for silver coins was remarkably diminished, as if the Mint shared in the general dulness and depression of all trade and manufacture. An article in the "Times," referring to this, contained some curious statements,† which we extract for the amusement of our readers:

There is a popular notion that any one taking gold,

* Gold, £5,076,676; Silver, £493,416; Copper, £50,624.

† The "Times" article describes the concentration of the various mints—London, Chester, Winchester, York—in one office in the Tower, where the works were carried on till the erection of the present building in 1806. It is then stated that: "Since 1806, the New Mint has been the sole coining centre for the British empire, where not only all the coins, from farthings to pounds, are struck, but where all commemorative medals and decorations awarded by the Government are made." By "the British Empire" is here meant the British Islands only; for Imperial mints exist in the colonies, and in all three Indian presidencies. The Calcutta people are rather proud of telling that their Mint Master, Colonel Forbes, of the Bengal Engineers, was deputed, about twenty years ago, by permission of the Court of Directors, to come to England to organise the new machinery then introduced at the London Mint.

silver, or copper to the Mint can have it at once made into an equal weight of pounds, shillings, or pence, and this at one time was the fact. But it is not so now, except with respect to gold. Time was when silver plate and bars of copper, gold ornaments, and gold trinkets used to be left for coinage. Now, however, the practice has sunk into desuetude, for the Mint is not bound to return coin for bullion in less than twenty days, and not now bound to take private consignments of silver or copper at all. People find it much more advantageous to dispose of their metals through the ordinary metal and bullion agents, who pay on the spot, and from these again the bullion agents of the Mint buy, according as silver or copper is needed. The Act of the Mint still binds them to take gold from any who bring it to them in coin, though, as a rule, these transactions are done through the Bank of England, which, of course, has to buy gold in ingots, dust, bars, or foreign coin, and which either sends it to the Mint for its own purposes, or sells it to the Mint as it may be wanted. As a fact, however, any one taking gold to the Mint can have it made into sovereigns, and the country bears the whole expense of the coinage. The very last private application which was made to the Mint came from Mr. Peabody, who sent about £10,000 of old gold of all kinds to be made into sovereigns. This was the only application of the kind that has been made for years past. It is a singular fact that, for the first time in the history of the Mint, not a single sovereign was struck there during the whole of last year, nor has one yet been struck there during this. During nearly fifteen months, in fact, not a pound sterling in gold has been added to the currency of the kingdom. It was thought after the panic of 1866, that the Mint would have to coin more money; but the very reverse has been the case. The Mint itself is suffering from the depression which has for a time overtaken all trades and occupations. The demand there now is not for pounds, but for shillings and sixpences, and even at the manufacture of these the men are only working half-time, and at little more than half wages.

Before proceeding to describe how the money itself is manufactured, it may not be out of place to say a few words as to how currencies die out, and how certain coins are popular or unpopular for years. The guinea and the half-crown were always popular; the five-shilling piece, the florin, and the fourpenny piece were always unpopular. The guinea was first coined in Charles II's reign, and derived its name from the Guinea Company, which used sometimes to stamp on it the elephant, as symbolical of its African origin. The guinea was so popular that its successor, the sovereign, was for a long time looked on with dislike. It may surprise the reader to hear that any coins of the realm were ever looked on with disfavour, but the records of the Mint show that the public are as fastidious in their coins as in their food; and there are some which are regarded with such dislike that the public will not take them till they see they can get no others. In this way the coinage of guineas was stopped, and the sovereign forced upon the public, who have now taken to it very kindly indeed. But this has not been the case with either the five-shilling or fourpenny pieces. The former were old institutions of long standing unpopularity. Many, even in the simplest retail transactions, refused to receive them. But they were driven out of circulation by the bankers, who sent to the Mint for silver, and the employers, who sent to their banks for silver, both of whom so constantly stipulated against taking five-shilling pieces that they remained on the hands of the Mint. Yet about £2,000 worth of these coins are made every

year to go to the Falkland Islands. There the whalers, English, Germans, Swedes, and Americans, assemble to pass the winter in harbour, and among them the only accepted currency is the English five-shilling piece; for them, therefore, it is manufactured, and to the Falkland Islands it is sent. This noble coin, therefore—by far the handsomest in our currency—is now no longer issued in this country, and will soon become as much a thing of the past as guineas. The fourpenny piece, which was introduced for the first time in 1836, has always been so unpopular that its coinage has been discontinued, and for the last twelve years not one has been struck. The favourite half-crown, too, has gone the same way, though not without a struggle for its retention on the part of bankers and employers, who took a great aversion to the florin. But it was useless coining two-shilling pieces and two-and-sixpenny pieces at the same time, so the latter have been discontinued, and now only florins, shillings, sixpences, and threepenny-pieces are struck. What are called the garter sovereigns, the lion shillings, the rose, thistle, and sham-rock shillings have all nearly disappeared from circulation, not only because they come into the Mint and are remelted and reissued in a more modern guise, but because from their scarcity there is a belief or kind of general notion that a sort of "luck" attaches to them; so they are kept to an extent that has made good impressions very scarce indeed, and when they do appear the cleanliness and sharpness of their outline show at once how little they have been in circulation. A curious illustration of this may be found even so recently as in the history of florins. The first issue of these were small in size, and the usual letters F. D. had to be omitted from their circumference. A sort of protest was raised against this coinage, which at once received the name of the "graceless florin." Public attention was thus directed to them; they were kept as specimens, and though 750,000 were issued, hardly any are in circulation, and none are returned to the Mint.

The amount of damage sustained by spurious coinage is very small. There are only a very few coiners or "smashers" in London, and as they have to manufacture by hand—that is to say, to cast each piece separately in plaster moulds, and afterwards electrotype it—the process is very slow, and is entirely limited to the silver coinage, and more especially the florin and the shilling. Coiners never make money to pass themselves. They make it and sell it in dozens to those willing to undertake the risk of palming it off on the unwary; and the price of these counterfeits is in exact proportion to the risk incurred in passing them. Thus, counterfeit florins of the best class cost as much as 12s. a dozen, and the best class of shillings 6s. a dozen; and these coins, unless minutely examined, would be taken off-hand by any one. On the other hand, shillings can be got as low as 2s. a dozen, and common florins for 3s. a dozen. The "smashers" are a peculiar set of rogues, the number of whom has not much increased or diminished for the last fifty years. There is a kind of "cutler's law" among them, never to tell from whom they buy the coin, though the Mint police would rather catch one maker of counterfeit coin than twenty utterers. Only one formidable attempt against the gold coin was ever made, and this was some three or four years ago. A party of Germans established themselves secretly at Hamburg, and entered into a well considered and deliberate plan for making English sovereigns. These conspirators did not fall into the vulgar error of our native "smashers" in making actually bad sovereigns. They simply put so much additional alloy into the pure

gold as to make its value 17s. instead of 20s. These adventurers made proper steel dies, erected presses, and had all the appurtenances for the processes which are gone through in the English Mint—in fact, they established a private mint at Hamburg. Many thousands of their sovereigns got into circulation on the continent; for, in fact, none but the Mint authorities could detect them except by weight. By this test, however, they were at last discovered, the coiners traced, and their place of business seized. The chief conspirators escaped, but all their dies, machines, and a very considerable sum in pure and adulterated gold fell into the hands of the Hamburg authorities, so that the speculation, though boldly conceived and skilfully carried out, was a ruinous one after all. Not half as many sovereigns were put into circulation as would pay the first cost of the plant employed in their manufacture. Yet within the last few days one of these sovereigns was sent back to the Mint from Devonshire, simply on account of its extraordinary lightness, without apparent wear, and the tests showing it to be to all appearance standard gold. Of course, at Tower-hill it was at once recognised and destroyed.

Those who have now and then to pay in sovereigns at the Bank of England know how often one or two or more light sovereigns are rejected—that is to say, not returned, but cut into two or three pieces, 4d., 6d., or 8d., according to the deficiency of the piece, being charged for the unpleasant process. The popular impression is that these cut sovereigns go back to the Mint to be remelted and recoined. But there are a vast number of trades in England which require standard gold for all sorts of purposes, and these regularly go to the Bank to buy these cut sovereigns. The reason is obvious; few trades use so much gold at once as to require an ingot, which weighs from 250 to 300 ounces, and if they did they have seldom the means necessary to melt it. But they can buy the cut sovereigns by the ounce or the pound, and though as *coins* they may have been light, yet as *metal* they are known to be pure. In this manner, between the gilding and porcelain trades, an immense amount of gold is annually absorbed. The porcelain trade alone takes nearly £50,000 worth of gold a year, and between gilding and porcelain the annual consumption of England and France is estimated at not less than 40,000 ounces, which is lost to currency for ever.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."
JAMES SHERIDAN KNOWLES.

OF the impulsive in the poetical temperament I have said something in the introduction to the Ettrick Shepherd, and, what was characteristic of the Scottish minstrel, was true of the Irish bard Knowles who had a dash of the impetuosity native to his country. In earlier times, when ill-received by a Bath audience in the performance of the Hunchback in his own play, he next morning called on his friend Abbott, to shake, as he said, the dust off his feet against the City of the Sun, and bid him farewell. He was resolved that "no Bath idiots should have another opportunity to affront him." Abbott in vain endeavoured to persuade him to stop. "No, my dear fellow; nothing on earth could induce me. No, no. I'm off by the first coach. Can I take any letters for you?" "Where are you going?" innocently asked the good-humoured Abbott. "I don't know yet," was the reply.

But how the scene was changed, as years stole over the head of the gifted dramatist. The fervour of his mind developed in a new direction; and, as is well known

from his publications, he became devoutly religious. I venture upon no comment, but offer the following letter in his later period, before his final exit from the stage of life, as one of the most striking and characteristic that ever could be written.

Port Bannatyne, Bute,
30 July, 1849.

MY DEAR JERDAN,—I am indebted, and deeply, to the delay that has enriched me with so kind a letter. Did not I know that you loved old Knowles?

Indeed, dear friend, it was of the cause that I thought more than of myself. I thank God I think less about myself every day.

I am just concluding a reply to Dr. Wiseman's first lecture on the dogma of transubstantiation, a tissue of sophistry and execrable logic. But the poor man cannot help it; he is under the influence of that strong delusion with which God tells us that he visits those who do not receive the love of the truth—his holy word!

Farewell!—a thousand thanks. You know not how happy you have made your sincere and much-indebted friend,

James Sheridan Knowles

I trust to nothing in the controversy into which I am entering but the Word of God. I read no human work upon the subject, except such as I meet with in the mart of Antichrist.

Ah, Jerdan, I never was so happy as I am now, and yet I am writing in a fit of the gout. Depend upon it, my friend of many a year, my kind and ever steadfast friend—depend upon it that a man never begins to live indeed till he lives to die.

Have you lately seen old Forster? Jack, I mean.* I love old Jack, though we hardly ever meet but he snubs me; yet he can work for me like a Trojan when I require it. None like him, and no mistake.

In a huge hurry, expecting our morning post the very next moment.

Good bye!

BARBARA HOFLAND.

OF this popular novelist, poetess, and otherwise considerable writer, the biographies speak laudably, as the author of "Emily (4 vols.) and Beatrice," and the "Unloved One," and "The Son of Genius," and "Tales of the Priory," and "Self-denial," and "The Merchant's Widow," and "Decision," etc., etc., and which productions, as genuine pictures of life, ably constructed, and of excellent moral and social tendency, well merited the public approbation bestowed upon them. To be sure, this success was achieved before the *furor* of the sensation novel was sought and attained. Her poor invention (though she also published a volume of poems) did not reach to the creation and building-up of Frankensteins for her heroes, nor to the conception of heroines endowed as the Witch of Endor, and ten times more wicked. Her characters were only human beings, and engaged in human actions, and she was herself a kindly, good-natured woman, who thought no evil, and delighted in doing good. She was the wife of Hofland, one of the sweetest of our landscape painters; and both were amiable as their occupations.

The following letter was addressed to a literary lady, and only communicated to me with the view to enlist my services in the cause, in which, if I remember rightly, nothing was effected. Thelvall, it may be recollected, was one of the first and foremost of democratic reformers,

* "Jack," so called with his familiars, but not the less a heartfelt and a just compliment paid by the writer to his constant friend, John Forster, the author of so many admired historical and biographical works. That I somewhat deserved the similar sentiment expressed to myself, I am gratified to preserve the memory by stating that, on the death of my gifted friend I took the liberty of addressing a letter to Mr. William Cowper, with whom I had the honour of a slight previous acquaintance, the result of which was (as he kindly replied to my letter) that he recommended the case to Lord Palmerston, and the widow received the grant of a pension.

and a very popular lecturer for the dissemination of their opinions, specified in the "Anti-Jacobin" as—

"Thelwall and ye that lecture as ye go."

Sir James Macintosh's famous "Vindiciæ Gallicæ" only followed suit; but the letter has so little to do with these matters, that I merely mention them for the sake of explanation.

The letter itself I give as an example of the conspicuous superiority of the female over the male sex in this species of composition. As I read it, I would say that no man could have written it, though ever so able and skilful in composition—it is woman, and woman all over:—

Though you are, I well know, very busy, yet I cannot forbear calling your attention to the situation of poor Mrs. Thelwall, who, as the widow of a man who for half a century was the unflinching advocate of those political principles which at length obtained ascendancy, appears to be unaccountably neglected.

It is well known to many high in power that the widow and an infant of two years old are left destitute, yet not a single sovereign has been offered to enable her to lay a plain stone upon his grave, nor has one newspaper pleaded her cause with one party, or commented upon her situation to the other. This is the more strange, because, though Mr. Thelwall had outlived his early friends, he was, as a lecturer, making others up to the day of his death, and he was allowed to be truly a patriot and an *honest man* by all parties, as well as a man of considerable attainments.

It is true Lord Brougham gave his son a living, with the understanding (I believe) that it should be an asylum for the old age of his father; but the Chancellor could not be aware, I think, that, at the best, this living only produced £200 per annum, and it appears that, from tithe disputes and such things, it now produces comparatively nothing, and young Thelwall was really better off as a curate. Unhappily Mr. Thelwall advanced his son upwards of £200 (his savings for the last few years) in order to render the vicarage habitable, in consequence of which his widow is without money entirely, as, under his present circumstances, it is impossible for her son-in-law to repay it; and, as his eldest sister is entirely dependent upon him, even if his living comes round what can he do for Mrs. Thelwall and her child?

If by the aid of a little money she were put in a way to help herself, there can be no doubt of a woman of her decided abilities doing well. She can teach both the harp and piano, she is perfectly mistress of French, and, I think, Italian, and she understands thoroughly the mode of curing impediments of speech practised so successfully by her husband. She has long feared that she should be left in poverty, and is not only willing but desirous of exerting herself to the utmost, and is of such an upright and independent mind that she refuses to burthen a widowed mother with herself and child, though a home with Mrs. Boyle has been warmly pressed upon her.

And surely it is no small praise to say of a young and handsome woman, full of various attractions, placed continually before the public as the wife of a man thirty-five years older than herself, that the breath of slander never has passed over her, that even the malignity created by political feeling never aimed an arrow at the husband through the medium of his pretty wife, a circumstance which argues not only the strict propriety of her manners but the high-minded purity of her principles, especially as she had not the ties of a mother to aid those of a wife till within the last two years.

Pray do think about her and assist her if you can. The press can do anything. Her own party ought to be roused in her behalf, or exposed for their deficiency, and I really think the others might take up her cause from magnanimity or pity. She is a Catholic, not a bigoted or ignorant one, but a steady Christian, who even the husband she revered could never turn aside from that which she held to be the true faith. Surely those of her own church ought to hold her in especial estimation.

But I ought not to press upon your time. I know enough of the kindness of your heart to feel sure you will do your best for one whose case claims compassion from *all*, and positive aid from those who know that, for half a century, her husband consistently advocated a cause he held to be sacred, and to which they have *professed* attachment. Cold and weak must it have been if their orator and champion, a man of consistent conduct and unblemished name, may thus drop into oblivion, and leave in vain those dear ties to their care who ought to be cherished as the valued legacies of one who bequeathed them to his country.

Once more forgive me, and believe me with sincere respect

Your faithful servant,
B. HOFLAND.

Kensington, 15 July.

Hofland died about twenty-five years ago, and his widow survived him hardly twelve months.

T. CROFTON CROKER.

Cork has been called the Athens of Ireland, and if we glance at the prolific number of distinguished artists and authors it has given to the world, though it cannot boast of the two great minstrels, Moore and Lover, I think the justice of the compliment may be frankly conceded. Among its worthies, who come within the scope of my design, the writer of the annexed letters takes a prominent place. His various illustrations of his native country in many of its aspects, historical, legendary, antiquarian, scenic, and jocular, demonstrate his patriotic attachment to it, and procured for him its grateful recognition. He was taken from us before Ireland had fallen upon the evil days of which we hear so much. He was naturally a humourist. How would the change have affected him? Well might he have asked Where are the national characteristics now? What has become of the fun and frolic almost universal and always so entertaining? Where are the Irish characteristics—the good humour, the sportiveness, the nonchalance, the open-heartedness, and the brave endurance of hardship or misfortune? Where be their jibes and their jests? Can all that was attractive and estimable have sunk into dark conspiracy, and been swallowed up in fiendish schemes of rapine and murder? Surely this cannot be all true; sad it is to think how much of it is. Let us hope that Ireland and Irishmen will speedily resume their genuine condition, and be again what Crofton Croker (being one of themselves) so pleasantly painted them. Och! for the darlint Paddy, even with his coat buttoned behind; the mischief-loving, bull-making, ready-witted, self-satisfied, naturally dexterous and ever merry Pat, to give us a laugh at all his eccentricities, and a pity for his aberrations. Och, that we could enjoy him again in all his national characteristics, using the present joyously for what it was worth, not brooding on the future for the miseries it might inflict. Let us hope that the auspicious visit of the Prince and the Princess of Wales may be the dawn of cheerier and more loyal days.

It is not easy to illustrate Croker's participation in the humours of his country, as he often in his letters engrafted the pencil on the pen; but they may serve to show the interest he felt in the proceedings and improvements of the passing time.

52, Charlotte Street, Portland Place,
7th January, 1828.

MY DEAR SIR,—Since I last wrote to you I have done little but grumble at the gout, which lingers about me sadly. I still carry my left arm in a sling, and can only hobble across my room on crutches. I hope to get out soon, but I really know not when.

You have had *all* the services I could perform, viz., enclosed review, or rather notice (which I assure you is perfectly impartial) of some new songs.

To-morrow I expect from old Landseer an account of two very curious autograph letters of Adam Smith, which, with rather a curious one of Smeaton's and some others, he has recently (as I think I mentioned to you) tumbled up among Dr. Roebeck's papers. Out of his account I hope to make a good "variety paragraph."

I also expect notices of the most recent Danish and Swedish

literary proceedings, and which I hope I have made arrangements shall be continued to the "L. G." from time to time, through the Swedish Embassy here. The Swedes, I have been astonished and pleased to find, are extremely literary. Every one who pretends to the character of gentleman writes English, and every officer of their navy must undergo a severe examination in French, German, and English before he is considered as qualified to serve. Northern antiquities and mythology, to which their attention has been called by the writings of Sir Walter Scott, are at present the favourite subjects in Sweden; and really if I could recollect half the delightful anecdotes which my friend told me on these subjects I could make a wonderful "Gazette" for you. However, he has promised to put them down for me, and you shall have them, as well as his further communications.

Not a word yet from that lazy dog Wyon [the admirable designer of our mintage]. He shall have another twopenny.

I expect a collection of North Pole plants, and anecdotes concerning them, in a few days, which shall be of course at your service.

I have just got your note. I really sympathize hand and foot with our poor poetess. The possibility of one who possesses so much innate fire as L. E. L. catching cold, never entered my head.

Our cloaks? I will write to the demure Deborah by to-morrow's post, and you shall be acquainted with the result.

Ever truly yours,

T. CROFTON CROKER.

Buckingham's paper—*sad* stuff, heavy as unleavened bread. It cannot rise!*

The "Literary Journal" (from "the editor" of which I have had rather a cool letter)—a mere childish affair evidently without the slightest pretension to connection.

The next is full of literary chit-chat.

Admiralty,

30th July, 1828.

MY DEAR JERDAN,—In the first place I was delighted at seeing even your handwriting once more this morning; but more on that subject hereafter. In the next place I want you to put Mr. Dagley's christian name and address on the enclosed note, and shall further "be obligated to your honour" by forwarding it to him. It contains the proof of Miss Dagley's really very pretty story, and I am of course anxious to get it back that it may be printed off.

Now for myself. I have been full of business, morning, noon, and night, with the "Christmas Box," which I have at last got into good train, and hope all will now go smoothly with me.

I have written for Allan Cunningham's book a little Irish tale, in return for some verses which he sent me for mine. I was obliged to decline Southey's ballad which he wrote for the "Christmas Box," about a cock and a hen, on account of the price—£50!!!

I have sent Miss Edgeworth, according to your advice, £30 for her article. I have got pretty contributions from Miss Mitford, Henry Ellis, Major Beamish, Mrs. James Douglas, Mrs. Holland, Madame de Labourg, etc.

I have nearly completed a jewel of a book for you, of which you shall have an early copy—"Legends of the Lakes; or, Traditionary Guide to Killarney." I am quite pleased with it myself, and I think it must be exceedingly popular. But not a word more until you see the volume, which is printing off as fast as Whittingham can work it. It is a musical, poetical, political, legendary, topographical, and pictorial work.

I will scribble something about the books which you sent me this morning, early next week. I must also send you (which I shall without delay) the sketch of society at Hastings, long promised, and live in hopes of seeing you when all this bustle is over.

Most faithfully yours,

T. CROFTON CROKER.

I add a third, simply as quoting some acute remarks on biography by the other Mr. Croker (J. Wilson); it refers to a memoir for Fisher's National Gallery.

Admiralty,

20th December, 1832.

MY DEAR JERDAN,—I have just received a letter from Mr. Croker, from which I copy the portion wherein you are concerned. It is dated yesterday.

* It got into more clever hands, however, and did rise to extensive circulation.

"I will, at my first moment of leisure, send you a sketch of Lord Hertford's life; but nothing is so hard as to write the life of one still living (unless he happens to be at your elbow), as it is very difficult to get at dates and facts with which the Peerages supply one in the case of the dead. In two or three days I shall hope to be able to send you a short memoir, which your friend may use as it stands, or may add to, alter, or improve upon as he may think proper.

"I shall also, if it would be agreeable, send you a little notice of a story book which a *young and fair friend of yours** has written, and which is about to be published by Mr. Murray. 'Tis a trifle, but to me it seems clever in its way."

I have written to Mr. Croker begging him to send the memoir without loss of time, as the month is so far advanced, and I therefore reckon on it by Saturday. I hope this will answer your purpose; and as I am going into the city this afternoon, if I can, I will call at Fisher's, and give them your reason for the delay, should the Marquis of H.'s portrait be for this month.

Ever yours,

T. CROFTON CROKER.

I shall only add that Croker delighted in practical jokes of the most amusing kind. He was for many years President of the Noviomagians, a playful offshoot from the Royal Society of Antiquaries; and I once, in conjunction with his wife, took him in female attire to be hired by friends who wanted a servant. They happened to be out walking; and, waiting their return, the applicant maid was taken into the kitchen by the cook. The confidential revelations of that functionary of all her master's and mistress's faults, and the disagreeables altogether, were so formidable that our Sally begged leave to decline! It was a very droll adventure.

LIFE IN JAPAN.

V.

FEMALE EDUCATION.

THE Japanese women have more attention paid to their education than is usually bestowed upon the instruction of the female sex in other Eastern countries. For the lower classes of society there exist what may be termed primary schools, where both boys and girls are taught together. At a proper age the boys are drafted off to separate schools to pass through a definite course of study, and the girls are instructed in domestic matters. The accomplishments of painting and music and poetry are taught to women of the higher classes, as well as to those whose only object is to attract attention. There are dramatic, historical, and poetic works written by women, which command as much attention as those produced by men. This, of course, evidences an amount of mental culture in Japanese women, nearly if not quite equal to that of the other sex. The possession of the power of literary composition amongst Japanese women is of very ancient date; for we find poems written by them amongst popular collections which go back to very ancient times. For instance, Jito wrote the second Ode in a number gathered together by Teika, who died A.D. 1241. Her mother was the daughter of a nobleman. Jito married the Emperor Ten Mu, and after his death assumed the government in the year A.D. 702.

Another lady, with the difficult name of Murasaki-Shikibu, wrote fifty-four very celebrated histories, to each of which she prefixed a figure composed of five upright strokes, connected by horizontal ones, and a name was given to these strokes which served to designate

* Mrs. George Barrow.

the stories they headed. The whole collection was termed "Gen-ji-mo-no-ga-ta-ri." This means, when translated, "The History of Affairs of the Original Families." It probably was a work similar in character to Burke's "Anecdotes of the Peerage;" that is, a narrative of events which occurred in the oldest and noblest families of the land; and these have been handed down to the present day, one of them being embalmed in the collection before referred to.

So, again, we hear of a mother and daughter, high in rank, who both possessed so much poetic talent that, on some verses composed by the daughter being read at court, the audience refused to believe they were not the mother's production, until she disavowed having in any way assisted her daughter in writing them.

These facts, which can be relied on as authentic, show the great age of these Eastern civilisations compared with our own; for at a time when England was divided into numerous small districts, and its inhabitants engaged in constant petty warfare, when letters were preserved only in the monasteries, and the chieftains knew no arts but those of the sword, Japanese princesses were composing poems which, repeated from mouth to mouth, and multiplied by the process of printing, have been handed down to the present day.

Painting is another art in which Japanese women excel. It is particularly in depicting animals, birds, and flowers that their talents are displayed. In harmony of colour they are not surpassed by any other artists, and their delineation of birds in every variety of attitude, either during flight or on the ground, is most true to nature. Sometimes it is the wild goose, just rising from a cover of reeds, or the stork preparing to rest on the ground, or with outstretched neck taking its distant flight, that is drawn with a fidelity and life-like truthfulness that seems the effect of genius, and not of mere imitation. The stork, which endears itself to the inhabitants of every country it visits, is a very favourite subject for the decoration of boxes and cabinets, and is drawn as frequently as the domestic fowl and the pretty little sparrows.

Books, fans, boxes, and screens serve as vehicles for the display of this talent; the perspective is somewhat out of rule, though much superior to that of Chinese pictures, and the colouring is so harmonised and tempered that the eye at once recognises its beauty. Water-colour painting is the only branch of the art known in Japan; and so much freedom has been attained in the use of the brush, that with a few touches of broken tints, defined, perhaps, with Indian ink, the design stands clearly on paper. The art of printing in colours has been practised for centuries in the Land of the Rising Sun, whilst with us it is still quite a recent discovery.

Designs are also furnished for embroidery, which are beautifully executed on satin, the drawing being copied in coloured silks and gold thread. The absence of substantial walls to their apartments may perhaps account for pictures, simply as pictures, not being seen in their houses; but a substitute is provided in the shape of paintings on scrolls, which must be unrolled to be displayed. These often represent mountain passes or views of the Bay of Yeddo, with the far-famed Fusi-yama in the distance. Its graceful cone, and the reverence which is felt for it by the Japanese, has probably educated their taste in the appreciation of beautiful form. In alluding to it we may as well diverge from our immediate topic to speak of this, the "Matchless Mountain," and the influence it has had upon Japanese

art. Its elevation is far greater than that of any mountain in its neighbourhood, being a few feet higher than Mont Blanc, or about 14,150 feet.

Rearing its graceful snowy summit far above the surrounding hills, it can be seen from great distances, and, though situated sixty miles inland, it serves as a landmark to the navigator when steering through these dangerous seas. Every atmospheric influence lends it a fresh charm. When the morning sun strikes upon it and gilds its silvery cone, or when the sun, sinking behind it, makes the sky glow with crimson, and throws into full relief its lovely yet gigantic proportions, Fusi-yama is seen in all its magnificent beauty. Then, if mist dull the view, its summit, raised far above earth-born clouds, is sometimes seen emerging from them; but from its height it is difficult to distinguish between mountain-land and cloud-land. Sometimes the jealous mists roll suddenly away, and reveal it in all its grandeur. Occasionally, in the fierce heat of summer weather, the melted snow may be seen trickling down its steep sides in glistening streams.

Fusi-yama is regarded as the type of beauty, purity, and strength, and certainly combines, in a way that no other form does, the ideas of vastness and loveliness, ideas which are not usually excited by the same object.

Sin-foo, the warrior priest, and founder of the purest sect of Japanese religions, was buried on that mountain 300 years B.C., and his tomb has ever since been looked upon with awe and reverence, and a pilgrimage to it is considered as one of the most sacred duties.

The ascent of this extinct volcano is, as may be anticipated, very steep and rugged, and many of the pilgrims have lost their lives in endeavouring to attain its holy heights, for fierce storms sweep down its rocky sides, and overwhelm the tired traveller exposed to their strong blasts. The difficulty of the undertaking, of course, increases its merit, and invests the pilgrim with a holy character, when successful; and thus the most deeply-rooted principles of human nature, as well as the strong love of natural beauty implanted in them, make the Japanese regard this mountain with love and awe.*

Though Fusi-yama is no longer in active eruption, yet the whole district betrays its volcanic origin, and constant earthquakes shake the solid earth, and show what powerful perturbing influences are still in operation beneath. Like other volcanic soils, the ground in the neighbourhood is favourable to the growth of the vine, and delicious grapes are produced, which, as has been mentioned before, our sisters in Japan pack carefully in arrowroot for transmission to distant parts.

Subjects for decorative purposes are chosen from other sources besides the winged tribe and landscape scenery. The floral kingdom, also, contributes many beautiful objects for designs. The iris, or blue flag; the mowtan, a flower similar to our peony; the peach and plum blossoms, the pomegranate and lilies, are often represented, each kind generally forming a separate study. The feathering and graceful bamboo is used with great effect in every variety of decoration, whether it be for the embroidery of a little boy's robe, the decoration of a cabinet, or the foreground of a landscape.

* This monarch of mountains exerts an almost equal fascination over foreigners residing at Yokohama and Kanagawa, who soon come to look upon it with pleasure and affection, and it is a constant object of attraction in their daily walks and rides. An English lady has recently ascended to the top of Fusi-yama, Lady Parkes having accompanied Sir Harry S. Parkes, our Minister Plenipotentiary, in his expedition to its summit. Some British merchants were with this privileged party.

Varieties.

CHAMBERS OF AGRICULTURE.—As a class, agriculturists have been the last to combine for purposes of defence and mutual assistance, although they form the largest body of men in the kingdom who are engaged in one special employment, and employ more capital and more labour than any other class. It has been reserved, however, for the second half of the nineteenth century to see the agriculturists fully awake to a sense of their best interests; and, perceiving what combination has done for the interests of other classes, they have copied the example set them by Chambers of Commerce, and in various parts of the country have founded Chambers of Agriculture, the members of which meet from time to time and discuss such matters as most intimately affect them—such as turnpike trusts and highway acts, cattle disease and importations of foreign cattle, farm wages and labourers' cottages, compulsory education and the half-time system, etc., to which, in eastern England, has been added the subject of the present state of the gang question, with the restriction of the children's labour, the abolition of the mixed gangs, the licensing of gang-masters, and the probable regulation of the "private" gangs, into which the legislature is now making inquiry. At the present time there are about forty of these Provincial Chambers throughout England, numbering about 12,000 landlords, tenants, clergy, and others; and these Provincial Chambers are in connection with a Central Chamber of Agriculture in London, the business of whose council is conducted by the Central Council of twenty-six members, with nearly 100 representatives from Provincial Chambers. The Central Council publishes its own reports, and has it in contemplation to publish a monthly digest of the reports of the meetings of the Provincial Chambers. At the annual dinner of the Northampton Chamber of Agriculture, Lord Lyveden reminded the 340 guests that the Chambers of Commerce not only looked after their members' business at home, but, by telegraph and agents, looked after it all over Europe, and that Chambers of Agriculture should be equally active in looking after their interests. And these interests are shared in by all classes; for, as Mr. Wells said at the Inaugural Dinner of the Peterborough Chamber of Agriculture, "they advocate this movement, not to benefit themselves alone, but the country at large."

WRECKS ON THE EAST COAST.—Of the fearful loss of life on our coasts, the public reports and the shipwreck-charts published annually by the Life-boat Association, give us too plain an account; but we can hardly gain from them any idea of the miserable rotten vessels, through which the loss so often occurs, or of the still more miserable economy of selfish, unprincipled, grasping owners, in sending them to sea with too few hands to manage them. It is not too much to say that by the storm-signal system of the late Admiral Fitzroy hundreds of vessels escaped wreck, and thousands of our fishermen were saved. If the honourable gentlemen of the Board of Trade could have seen how strong a faith the sailors on our east coast had in the storm-signals they would have felt convinced that their efficacy was the cause of that faith; for we all know how slow seafaring men are, as a class, to believe in anything new, and especially if relating to their profession. A recent article in a quarterly publication called "The Shipwrecked Mariner," shows that a large proportion of the wrecks each year are referred to defects and unseaworthiness in the ships, and that in the last ten years nearly 1,000 vessels have been wholly or partially wrecked through that cause." It goes on to state that, "in the last seven years, accidents befel 230 ships between 50 and 60 years old, 102 from 60 to 70, 48 from 70 to 80, 14 from 80 to 90, 6 from 90 to 100, and 4 from 101 years and upwards." Thus we find that 535 laden colliers, and about 400 colliers in ballast, or nearly 1,000 of the total were wrecked in 1865, and 868 of the disasters took place on the east coast.—*B., Aldborough, Suffolk.*

A MALAYAN POET.—Amid all the wonderful varieties of mankind, effected by climate, forms of Government, traditional customs and manners, and stages of intelligence (cited as evidence of progress and civilisation), there is nothing more true than that human nature is the same. The following was not written in England in 1868, but in the Polynesian Archipelago, by a Malayan poet, hundreds of years ago (vide Marsden); and yet it might be attributed to our poet Laureate of yesterday. When England, like Sumatra, has become a "nice little island," without adjacent territories and colonisation, the les-

son, which is here translated from the Malayan, may be re-translated for some other powerful people:—

"It is time that those of the present race were wise;
They have much science, but plain good sense is wanting.
They are able to count the stars in the sky,
But cannot tell when their own faces are smutted."

So much for the astronomers, including the astrologers of these elder times. With regard to the general literati, the writer adds—

"Their employment is mutual obloquy, and recrimination,
And every place is filled with inquisitive tattlers."

But the Malayan poet goes into another mood; and it is in this we feel as if he had come home upon Belgravia and us in the guise of a "Saturday reviler."

"In these days the behaviour of young women is immodest,
Flirting, and toying with the young men.
It was not the case with maidens of former times,
Who possessed much delicacy and sense of shame.
Circumstances are now very different,
And all sort of conversation is familiar to them,
Where there are a number of youthful gallants,
There you will find the women assembled,
Whose manners assume a variety of hues."

Such is the Malayan moralist's description of the "girls of the period." The consequence of all this is too obvious.

"Even the children, now o' days, imitate their elders,
And both boys and girls are equally forward;
They play about promiscuously together,
With all the familiarity of man and wife.
Are not such things evident signs
That the end of the world is drawing near?"

W. J.

PRAYER.—Time spent on our knees is not time lost, if after one hour of meditation about God we are given even one moment of the gracious sense of his presence. Of this the natural man knows nothing, he does not even desire it. He says his prayers as a kind of blind duty. He believes that it will in some way do him good, that God will directly give him the thing that he prays for, or give him a more submissive mind to make God's will his own. These are the two theories of prayer when looked at in the light of the intellect. They are true as far as they go, only they do not go deep enough to the root of the matter. There are three kinds of prayer corresponding to the three parts of our nature. There is lip prayer, notional prayer, and the prayer of devotion, properly so called, when the spirit rises into communion with the Father of spirits, when we do not merely desire good things from him but that he would reveal himself to us.—*The Tripartite Nature of Man; Rev. J. B. Heard, M.A. (Clark.)*

BUTTER TRADE.—The consumption of Irish butter in London is not 20 per cent. of what it was formerly. The quality of Irish butter has improved, but fresh competitors have entered the field, and in the north, where Ireland has hitherto held possession, French butters are gaining ground. Thus the countries from which the chief supplies were received in each of the years 1863, 1864, and 1865 were as follows:—Holland, 295,418, 336,224, and 345,026 cwt.; France, 135,098, 163,020, and 353,115 cwt.; Hamburg, 138,089, 128,305, and 120,162 cwt.; United States, 173,351, 142,672, and 83,216 cwt.; Belgium, 75,277, 81,575, and 70,619 cwt.; Denmark, 42,994, 62,329, and 65,555 cwt. The great increase from France is strikingly apparent. The greater proportion is made in Normandy and Brittany. The finest quality is sent to Paris; the other qualities, however, are noted for cleanliness, uniformity of colour, and equality of weight in each package. The Dutch housewives are celebrated for their cleanliness; every utensil employed in the dairy is bright, the floors are kept with rigid neatness, and the churns and pails are constantly cleansed. According to the Dutch Government, the quantities exported were 11,609,614 gallons in 1863, 13,351,897 in 1864, and 14,203,236 in 1865. The Dutch have always had the greater share of the London market, but within a few years a trade has sprung up with France, which surpasses that of all other countries. It appears, however, that the Irish producers have taken the field in good earnest; and it is to be hoped that their article, which is intrinsically good—better even than that of any other country—will not be displaced for the want of attention to matters of detail, the first and foremost of which is the all-important matter of cleanliness.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Copper.*

THOMAS DICKSON GIVES HIS MASTER WARNING.

THE MORTONS OF MORTON HALL.

CHAPTER XL.—THE SECRET OF RELATIONSHIP IS DISCOVERED
BY HENRY AND MARY MORTON.

As soon as Mr. Aston was informed by his niece that old Mrs. Margaret—of whom he retained a perfect and kindly recollection—was on a visit to St. David, he requested Mary to bring the old lady to Cliff Cottage.

Mrs. Margaret, who, to use her own words, declared that she would "ave know'd him to be a Morton if she had met him at the furdest end of the world," was somewhat disappointed because he confessed that at first sight he could hardly recollect her features. A brief conversa-

tion with him, however, satisfied her that if he had forgotten her features, he had not forgotten the many acts of kindness he had received at her hands when he was a child. He readily recalled to mind various little incidents connected with himself and his sister, which, though trivial in themselves, the old lady fondly cherished in her memory, and delighted her by the eagerness with which he listened to the history of various matters that had occurred after he had left home and was supposed to have perished at sea. The old lady declared that to see him and talk with him made her feel quite like a young woman again.

"Ah, Master Henry"—she persisted in calling him Master Henry, to the great amusement of Mary—"Ah, Master Henry," she said, "if you'd 'ave come back long years ago, things would 'ave been very different at the Hall, and at Fordham. My young mistress, your sister, poor dear, would 'ave been spared much misery, and would never 'ave been wronged so shameful as she were. Mr. Foley would never 'ave come in to the estates; and, lawks a me! I might 'ave been livin' housekeeper at the Hall to this day. I never thought, when I were a young woman, to see any one but a Morton master at the old place. And surely, Master Henry, now as you 'ave come back—better late than never, as the sayin' is—you won't let them Foleys, as treated poor Miss Mary, your sister, so shameful, remain where they be?"

"We shall see in time, Mrs. Margaret," replied Mr. Aston. "I daresay it will not be long before you see a Morton in possession of the Hall once more." "And, Master Henry," continued the old lady, "Miss Mary do tell me as you 'ave grown-up children in 'Meriky. Deary me; only to think! It don't seem so long since you was but a little boy."

"I have a daughter as old as my niece, and a son a year or two older," replied Mr. Aston. "Perhaps you may see them in England ere long."

The old lady continued to ply her questions until Mr. Aston at length rose to retire to his study.

"You must come and see me again, Mrs. Margaret," he said, as he shook hands with his visitor. "Come to-morrow evening to tea, you and Mary, and we'll have a long and cosy chat together about old times;" and so saying he left the room.

Scarcely, however, had he seated himself at his writing-desk in the study, ere there came a tap at the door.

"Come in," said Mr. Aston; and Thomas Dickson entered the room.

"What is it, Thomas?" inquired his master; "Nelson (the only horse Mr. Aston kept, which had been ailing) Nelson is no worse, I hope?"

"No, sir; Nelson be doing pretty well. He'll be all right agin in a day or two; but if you please, sir, I have come to say as I think o' leavin' sarvice at the end of the quarter, and I thought 'twere but right as I should give you fair warning."

Now, although Mr. Aston had roamed over the greater portion of the earth, and had lived for many years in the western wilds of America, where constant change is the order of the day, he had preserved amid all his wanderings the Englishman's love of old places and old faces. He had been a wanderer by force of circumstances rather than by inclination, and had never felt anything like content until he had married and settled down in America. Even then, as has been seen, as soon as he had lost his wife he felt an irrepressible yearning to return to his native land. It was therefore with a feeling of vexation and annoyance that he learnt, when Thomas presented himself in the study, that the man's object in seeking an interview was to give him warning, and request him to look out for a new servant. True, he had never really liked Thomas Dickson. He had thought him too fawning and submissive with his superiors, and too fond of playing the petty tyrant over his fellow servants. Mr. Aston insisted upon prompt obedience from his servants; but his long residence in the Far West of America had taught him to detest servility. Nevertheless, Thomas was a tolerably good servant, and a careful driver, and it might not, he thought, be easy to find another to fill his place.

"Why do you wish to leave me, my good fellow?" he

therefore inquired. "Have you heard of a better place?"

"Oh no, sir," replied Thomas, with an obsequious bow. "I couldn't wish for a better situation, nor a better master."

"What is it, then? Are your wages insufficient?"

"Dear me, no, sir; the wages is all I could expect."

"Why do you wish to leave, then? You have some reason, I suppose? Out with it, man, and don't stand simpering there like an idiot."

"Please, sir," said Thomas, looking down upon the carpet, and twirling his cape with his fingers, "there's an old saying, as sarvice is no inheritance, and I'm thinking of quitting sarvice for good, and settin' up in bis'ness."

"Humph!" grunted Mr. Aston, "you are at liberty to please yourself, of course. I only hope, my man, that you won't find, as I suspect many who have been fond of spouting that foolish old adage have found, that the service you disdain is better than the business you wish to engage in. What business is it, pray? A man needs some capital in order to commence business with any prospect of success."

"Please, sir," replied Thomas, "I've had a bit of a legacy left me, and I be thinking of going into the public line at Falmouth, sir."

"Of keeping a public house, I suppose you mean?"

"Yes, sir; if you have no objection."

"What objection can I have to your acting as you think proper? Though, if you'd take my advice, you'd lay by your money, and keep out of the public line, as you call it. I'm afraid, Thomas, that you're too fond of drink to safely expose yourself to temptation. It is the only serious fault I have to find with you."

"Dear me, no, sir, indeed," replied Thomas. "And I'm in no hurry, sir, for two months, or three, for that matter."

"Well, well," returned Mr. Aston, "you can do as you please. You may go at the end of the month, if you think fit. Meanwhile, I must look out for some one to fill your place."

"I shall not be sorry to get quit of the fellow after all," thought Mr. Aston, as Thomas, smirking and bowing, backed out of the study. "I wonder whether Mr. Sinclair or Doctor Pendriggen know of any suitable person. I must inquire next time I see them." And thus thinking, he dismissed the subject from his mind.

Mr. Aston had sat down to write to his son and daughter, in response to the letters received from them by the last American mail. It had become necessary for him to inform them that Henry Talbot was their cousin, and to explain to them the reason wherefore he, himself, had assumed their mother's maiden name on his arrival in England.

"Henry Talbot must have been aware," he wrote, after he had explained the relationship, "that you were his cousins, from the first moment of his arrival at Watertown, and also that there was some mystery pending over me, though it appears from your letters that while you spoke of me by my true name, he has never told you that he only knew me as Mr. Aston. As he could not be sure of my motive in assuming your mother's name, I think he has acted discreetly, and with great circumspection. If he be with you when you receive this letter, or if not, the next time he visits Watertown, it will be for you to turn the tables, and let him know that you have discovered his secret."

There was, however, other matter in the letter, which—although both Henry and Mary Morton had some idea that their father wished to end his days in his

native land—somewhat surprised and startled his children. He wrote that he had made up his mind to remain in England, and that he wished them to come to him as soon as possible.

"I shall not dispose of my American property," he said, "and there is no necessity that I should return to America. You, my son, can do all that is necessary for the present, which is to place some competent person in charge of the property during your absence—say for a twelvemonth; and then, if you choose, after you have seen England, you can return and resume possession. If you decide to remain in England, we must then make arrangements for the sale of the land and houses, and the shipping on the lake. Mary I should wish to remain with me; and, as the season will soon be growing late, I wish you to arrange matters, and embark for England as soon as possible. For aught I see to prevent you, you may be with me in two months from the date on which you receive this letter. I have been so long absent from you that I am naturally anxious to see you back again, and to introduce you to your cousin Mary, whom I am sure you will like. I shall be glad, and so, I am sure, will Mary Talbot, if you can persuade your cousin Henry to return to England with you. I think if you unite your persuasions you may induce him to take passage on board the same ship with you." The letter was filled up with advice relative to the arrangement of affairs during their absence from Watertown, which it is unnecessary to repeat.

When this letter reached its destination, it occasioned some thought. Mr. Morton's wishes, however, exactly coincided with those of his children; and, finally, Henry Morton wrote by the return mail that he and his sister would be able to make all needful preparations and arrangements within a month, and embark for England at the end of that period, and that they hoped to arrive at St. David, bringing Henry Talbot with them, within a few weeks from the date on which their father would receive their present letters.

Henry Talbot was absent on the lake, on board the Franklin, when Mr. Aston's letter, announcing his relationship to the family, arrived at Watertown. When, however, about a week later, he again visited the "Place," he was met, as he entered the grounds, by Mary Morton.

The brother and sister had previously arranged between themselves how they would greet him on the occasion of his next visit, and how they would make known to him that they had discovered the secret which they had no doubt he had kept to himself ever since he had known them.

"Ah, cousin Henry," said the young lady, emphasising the word cousin, "we have been anxiously looking for you for some days past. Your friend, Mr. Aston, has written to us respecting you, and we also have received a letter from our cousin, Mary Talbot. Seriously speaking, sir, what have you to say in extenuation of the shameful duplicity of your behaviour towards my brother and myself?"

The young lady tried to look serious, but she was unequal to the task. Henry Talbot comprehended at once how matters stood, and stammered forth in reply—"It is true, Miss Morton, that I knew—that is, I suspected—I mean to say, I thought from the first, but could not be sure; and I had no right——."

The young man was so confused that he was unable to explain what he wished to say, and Miss Morton, unable longer to keep her countenance, broke into a merry laugh.

The effect was contagious. Henry, who had been doubtful at first whether Miss Morton were not really angry to learn that she and her brother had been in a certain sense his dupes, laughed himself, and neither were able to speak another word until they were joined by Henry Morton.

"You seem to be making merry over the discovery of your cousinship," said the young backwoodsman, smiling himself in sympathy. "However, I am glad to see you, and to welcome you as my cousin, Mr. Talbot," he went on, holding out his hand to his newly discovered relation. "You must have discovered our relationship to you from the first moment you met us," he added. "Why in the name of wonder did you play us such a trick? Why did not you explain to us before this, that you were our cousin?"

"I was about to explain the reason to Miss Mary," replied Henry, "when she interrupted me by laughing at my confusion. I confess that I have suspected, from the first moment I met with you and your sister, that you were the son and daughter of my long lost uncle Henry. Nay, more, my suspicions were awakened before I left St. Louis. I thought, from some words the merchant in whose counting house I served let fall, that my friend Mr. Aston was really Mr. Morton; and as Morton was my mother's maiden name, and as Mr. Aston had taken such strange interest in myself and my sister, I thought it just possible, even then, that he might prove to be my mother's long lost brother. That supposition, in fact, explained several remarks he had made to me at different times, which were inexplicable to me at the moment.

"When I arrived at Watertown, these suspicions became almost certainty, especially when you related to me the history of the travel-stained pocket Bible, and I saw the names in the title page. Still, withal, I could not be positively certain; and if I had been—knowing as I did that your father had thought proper, evidently unknown to yourselves, and for reasons still unknown to me, to assume the name of Aston—I should not have thought myself justified in betraying his incognito to his son and daughter; and unless I had done so, I could scarcely have explained my own suspicions.

"He, I now perceive, has acquainted you with the facts, and I can only say further, that I am happy to claim you for my cousins, and glad that there is no longer necessity for any more mystification between us."

"Nay, the mystification has been all on your side, cousin," said Mary Morton. "I don't know, I'm sure, whether we really ought to overlook such conduct. What do you say, brother Henry? Do you think our cousin's plea justifiable? Do you think that, taking all the circumstances into consideration, we may accord him our forgiveness with a due regard to our own dignity?"

"I think we may, Mary," replied Henry Morton, smiling at his sister; "taking it into consideration that he is a foreigner, unaccustomed to the straightforwardness of our Western habits and manners, especially as we ourselves have to ask a favour from him."

"You mean, Henry, that we are commissioned to beg him to go to England with us?" replied Miss Morton. "Perhaps that may require no great sacrifice on his part. However, I am inclined to be merciful, so I will consent to overlook his past duplicity. What say you, brother?"

Further explanations were then entered into. Henry Talbot read his sister's letter to his cousins, as well as that to himself; and though he, of his own accord, now

that he had obtained employment which suited him, would gladly have remained longer in America, he offered no obstinate objections to his cousins' request, that he would be ready to embark with them for England at the end of another month; supported as their request was by his sister, who, although she made no mention of the distress she had suffered during his absence, expressed herself as especially anxious that he would return home.

He therefore wrote in reply to his sister, that she might expect him to arrive, with his cousins, in about two months from the date of his letter.

Henry Morton arranged with his father's overseer to manage the property during his own and his sister's absence, and Mary set to work at once to make preparations for her long ardently wished-for visit to England.

The mail-packet that sailed from New York, exactly one month from that date, bore on her passenger-list the names of Mr. Henry and Miss Morton, of Watertown, Michigan, and Mr. Henry Talbot, of England.

CHAPTER XL.—JEMMY TAPLEY HAS HIS SUSPICIONS AWAKENED BY A CONVERSATION WITH DAME BOLITHO IN THE FISHERMAN'S ARMS.

It is no easy matter, if it be ever so desirable, to keep any movement a secret in a small country village such as St. David. The news that Thomas Dickson was about to leave Mr. Aston's service, and take to keeping a "public" in Falmouth, soon spread through the village, and most people thought Thomas was a very foolish fellow to think of quitting a good and easy service, under a single gentleman, to encounter all the risks of business. The great wonder, however, was where Thomas Dickson had obtained the capital that would be required to purchase the lease and goodwill of the premises he spoke of occupying; and there were not a few who thought, with Mr. Aston, that Mr. Dickson would be a large and unprofitable consumer of his own liquors.

Nearly two months, however, had passed away since Thomas had given warning to his master that he intended to quit his service, and he still remained, though he intended to leave in the course of another month, by which time the public-house would be handed over to his keeping by its present proprietor. Mr. Aston had not yet engaged a new servant. The fact was, he was indolent in such matters, and, so long as Thomas remained with him, he hardly gave a thought to his leaving him.

The letters from America had been received, and Mr. Morton and Mary Talbot were anxiously awaiting the arrival of the next mail packet, which they expected would bring, as passengers, the son and daughter of the former, and the brother of the latter.

Mary, however, had not received any reply to the letter she had written to Sir Arthur Lockyer; and though she had learnt from Mrs. Margaret, who had returned to Hammersmith, that Sir Arthur was still abroad, she was naturally becoming very uneasy. She thought the young baronet's letters would certainly be forwarded to him, wheresoever he might be, and his continued silence created a doubt in her mind, in spite of her confidence in her brother's innocence, as to whether the baronet had really lent Henry the money he had shewn to her.

About this time Jemmy Tapley called in one day at the Fisherman's Arms, as he was in the habit of doing, to indulge in a chat with the widow Bolitho, over a mug of ale and a pipe.

It has been mentioned, in a previous chapter of this history, that Jemmy Tapley was present on the occasion

when Mr. Ferret was talking over the affairs of the village with the buxom and chatty widow; and since that time the old sailor had been turning over in his mind certain expressions he had heard from the lawyer, and wondering what could have brought him—for no apparent purpose—to the village.

That Thomas Dickson was in some way or other connected with the lawyer's visit, the old man felt pretty certain; yet he found himself utterly unable to conceive how two such distinct personages *could* be in any way connected with each other, or could have any business in common.

Jemmy Tapley had never looked with a favourable eye upon Dickson, since the latter had entered Mr. Aston's service; and yet, if he had been asked to give a reason for his dislike to the servant-man, he would have been unable to answer.

In fact, he had no reason for his antipathy, unless it were the innate aversion which a thoroughly honest man sometimes conceives to one whom he suspects to be a knave or a hypocrite; and this species of antipathy or aversion exists more frequently amongst the lowly and uneducated than amongst persons in a superior condition of life, for the simple reason that in the higher classes of society men are better able to conceal their real characters and feelings from each other, under the outward gloss of cultivation and refinement.

"Tummas Dickson still hangs on at Muster Aston's place," observed Jemmy Tapley to Dame Bolitho, on the visit to which I have alluded.

"Ay, Jemmy," replied the widow; "but aw've heard as un be goin' to leave at t'end o' th' month. The more fule he."

"He'll be wantin' a woife to mind the 'public' wi' un," continued the old sailor. It'll be four year sin' Sally Baker, his first woife, died. He weer livin' i' sarvice i' Falmouth then."

"Who'd be *his* second woife?" answered Dame Bolitho, with a scornful toss of her head.

"Aw *have* heard, widdy," the old sailor went on, with a sly glance at the active, bustling dame behind the counter, "ur un, ha' arxed you to go wi' un, and be missus o' the public at Falmouth."

"*Me!*" exclaimed the widow, her face flushing as she spoke. "Aw wudna ha' un, Jemmy, if un weer worth his weight i' goold. Aw woulna' ha' sich as he a'ter Cap'n Bolitho, if theer weer na another man i' the 'varsal world."

"But tha' canna say as un didna arx 'ee, widdy?" persisted the old sailor, enjoying the widow's vexation. "Aw ha' heerd from them as knows as he arxed 'ee so of'en that tha bade un ne'er to show his face i' thy public agin?"

"Ay," replied the widow, with a smile. "Aw'se warrant Jemmy as un'll not arx me agin. Aw sent un off wi' a flea in his ear, aw trow. He offered me—aw don't mind tellin' thee, Jemmy—he offered me a' the money aw wanted, and he bought a gay, gold bracelet from Falmouth, and said he'd put it on my arm if aw'd say aw'd be his wife. 'Na! not if tha' wert gowd thusen, and aw could melt 'ee down into gowd guineas,' aw told un, and he went off dumbfounded, and aw ha' na been plagued wi' un sin'."

"Where did he find money to take the public, and to buy gowd bracelets wi'?" said Tapley. "That's what aw canna understand, widdy."

"He says as he had a legacy left un," returned the widow. "But he didna give money for th' bracelet. When aw told un he weer too extravagant to go into bis'ness if he spent his money in buying jew'ry, he said

as he hadna bout it, but had changed some owd fashioned jew'ry as had belonged to his wife for th' bracelet, and some money into t' bargain, wi' Caleb Jakes the pawnbroker at Falmouth. Aw should like to know where his wife—poor soul—got hold o' the jew'ry he changed, for her folk as well as his'n weer as poor as church mice."

"What sort o' jimcracks weer they as un changed for t' bracelet?" asked the old sailor.

"Did un tell 'ee, dame?"

"Ay. 'Tweer a locket, he said; but he bid me say nought about it to nobody. But aw don't know why aw should howd *my* tongue to please *him*. He may keep t' owd bracelet till he can find a wife to wear it, for me."

Jemmy Tapley had by this time drunk his beer and finished his pipe. The entrance of fresh customers put an end to the conversation, and with a "good e'en" to the widow, and a nod to the fishermen, the old sailor quitted the public, and returned to his own humble cottage, muttering to himself, as he stumped along on his wooden leg, and, to all appearance, sunk in deep cogitation over what he had heard from Dame Bolitho.

THE QUEEN BEE.

THE queen bee, as is known to most, is larger, longer, and tapers more than the working bee. The wings are proportionately shorter, and on the under part of the body she is of a yellowish-brown colour. Like the worker she is armed with a sting. You never see the queen roaming about in search of flowers. Neither the queen nor the drone ever does this. Occasionally, however, the "royal mistress of the hive" flies abroad for an airing, or it may be, according to Huber, for some other equally important purpose.

The prosperity of the hive greatly depends upon the life and health of the queen. There are some circumstances under which even "the busy bee" will not work. Flowers may be scattered thickly over every meadow; trees and bushes may be literally dripping with honey; the bee may have a clean, healthy home, with the wax already made; and yet the bee will not work. How is this? The bees have health, strength, wealth—everything that is needed for bee-life—but the queen is wanting, and they are out of heart. They have no brood-cells to watch, no 'royal mother to defend, and they completely break down under their discouragements.

Who has not seen a royal cell, the "queen's palace" of the hive? This is not her majesty's residence, but her birth-place. It is unlike the other cells, and hangs down from the edge of some piece of comb. The workers and drones are hatched in cells lying in a horizontal position, but the queen is hatched with her head downwards.

Bee-writers tell us that all the eggs laid in the early part of the season are of the working sort; that the eggs for producing drones or males are laid about two months later; and those for the females immediately afterwards. In the first International Exhibition was exhibited a queen said to have been produced from a larva of the working sort; and the production of a queen in this manner has been pronounced "the most remarkable fact ever brought to light in natural history." My opinion is, that *there never was a queen produced in any other way*, and that all eggs produced by the queen are either male or female. Are not the working bees undeveloped females? Naturalists tell us that they are.

And will not the larva of the working bee produce a queen at any part of the season, if treated with the attention and respect due to royalty? I have had abundant proof that such is the fact. Why suppose anything so unnatural as that a queen bee should lay eggs male and female, and *something else*, this something else being the greater part of the eggs produced during the season? Or why suppose anything so unnecessary, when it is known that the eggs of the working bee sort will bring queens whenever a queen is wanted?

In the middle of March, 1856, the queen of a very prosperous hive, of good weight, died. I found her outside the hive, in a very weak state, and placed her within the doorway of the hive; but she died before the following morning. The busy tenants of the bereft home pursued their avocations as if nothing had happened, which convinced me that the deceased mother had been fruitful up to the time of her death. If so, according to my theory the bees could in due time raise another queen, but one that would necessarily be barren, as no drones were in the hive or in the garden. I watched this case with considerable interest, as it might confirm my views, or, on the other hand, set all my calculations at naught. For several weeks the bees worked well, and carried home a good deal of bee-bread—a sure sign that they had found nothing amiss. Now, however, the time had come "to pass the rubicon." The eggs of the late queen had all been used up, and, if no more could be hatched, the bees would become spiritless and sad. I felt persuaded that a queen had been secured, or the bees would not have worked so long. On the 16th of April there were evident signs of mischief. The hitherto industrious creatures ceased to carry in bee-bread. I wanted no further proof that the queen's eggs were not hatching, the cause of which was sufficiently clear. One of my hives having produced drones rather early, I had the opportunity of supplying my failing stock with their one *desideratum*. Therefore, on the 23rd of April I placed in the hive six drones, and prevented their exit by closing the doorway for a short time. If I had put these strangers into a hive where they were not wanted, they would have been expelled or killed without ceremony. Not so here. By the 10th of May a marked improvement had taken place. From this time the tide of prosperity flowed; and I find the following memorandum on June 17th:—"Drones still keep possession, and the population increases very fast." On the 4th of August I took a bell-glass of honey from this hive.

I once heard a lecturer (Dr. Carpenter) say that when a queen became old and barren, the bees destroy her, and raise up a young one in her room. If Dr. C. had gathered his knowledge from observation, instead of "from books, he would probably have arrived at a different conclusion. The faithful subjects abide by their royal mother to the last; and should her death be of a lingering kind, so that she can lay no eggs for a few weeks, the inevitable ruin of the community follows. I must add, however, that from unhealthy and incompetent queens we get many of our weak stocks, and all our "desertions."

The old queen leaves the hive with the first swarm. When the young queens are hatched, it often happens that another swarm comes off, accompanied by more queens than one; of these, one appears the favourite. Her majesty does not "lead off" her subjects when they colonise, but, dutiful subjects as they are, some of the commonalty precede, and commence clustering on some bush, or other convenient place, the queen following. It sometimes happens that the whole of a swarm will

alight without the queen, in which case they soon return to their old quarters. Take the following in proof. A swarm of mine came off, and "pitched" in their usual orderly manner. Before I had time to secure them they began their homeward flight. As I was watching their movements, I found the queen-mother on the ground, unable to fly; but she appeared to be otherwise in good health. I secured her, and allowed her to enter the hive she had just left. Thinking that the bees might on the following day repeat their attempt to colonise, and with the same result, I resolved to put the queen, with the swarm, into another hive. As I anticipated, the swarm again left the hive and clustered as before. Again I caught the queen, and, having hastily removed the old stock out of the way, put an empty hive in its place, and gave her majesty undisputed possession. Before she had time to complain, "This does not suit my dignity," the swarm, discovering the absence of the queen, again returned to what they expected to be their old home, but chanced to be another, and one not so well provided with conveniences and comforts. As soon as possible I carried away the swarm and replaced the parent stock. Afterwards all things went on smoothly and well.

Upon a similar occasion I found the queen, and thought it best to destroy her. The bees returned as usual, and awaited the advent of a more youthful empress. On the 9th day the hostile trumpet announced the birth of rival queens: one or two of these left with the swarm on the following day.

I once hived a fine swarm, and soon the bees, instead of going off to work, began making a sound which, to the apiarian's practised ear, means "We don't like our new lodgings, master." I went to the parent stock to watch them crowd home. On the doorway-platform of an adjoining hive there was a singular little bunch or coil of bees that attracted my attention. Suspecting that the lost queen might be in the middle, I hastily removed the whole to the hive which the swarm was deserting, put them on the ground, separated the bees, and, seeing the queen amongst them, guided her to the hive. The bees instantly changed their tone, and no more of them left the hive.

J. B.

THE MIDNIGHT SKY AT LONDON.

JUNE.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

MIDNIGHT at midsummer, in the latitude of London, is so influenced by twilight, that many of the small stars, visible to the unassisted eye in the dark nights of winter, can only then be seen with telescopic aid, especially those north of the zenith. The sky near the north horizon is now more or less illuminated, while the general aspect of the heavens bears witness that there is no real night, but that there is constant day or twilight throughout the twenty-four hours. To those of our readers who are resident in the north of England, or in Scotland, the absence of complete darkness at midnight will be still more evident; but if we proceed to higher latitudes, or within the Arctic circle, we shall find that there will be no darkness at all, and that the phenomenon of the midnight sun will at that hour be daily observed skirting the northern horizon. In London, however, there is always sufficient darkness on a midsummer midnight to observe stars down to the fifth magnitude with the naked eye, and consequently all contained in our diagrams.

Referring first to the lower map, or to the southern half of the sky, it will be perceived that, although there

is a general absence of very conspicuous constellations, yet several well-known stars are to be seen in different directions. Let us confine our attention at present to the sky east of the meridian, starting, as usual, from the zenith. The first star which naturally attracts our notice is Vega, about ten degrees south-east of that point. Very near Vega, in the same direction, are Beta and Gamma Lyrae, two stars of the third magnitude. Directly below these, and between Lyra and Aquila, are the small constellations, Vulpecula, the Fox, and Sagitta, the Arrow. Aquila can be distinguished midway between the zenith and the horizon, by its group of three stars in the neck of the Eagle, the central and the largest being Alpha Aquilæ, or Altair. Between Aquila and the horizon, Capricornus is situated. The position of this sign of the zodiac is not, however, well marked, owing to the paucity of large stars in that neighbourhood. North-east of Vega several bright stars in Cygnus are clearly visible, four of them being of the third magnitude. These are all generally known by a Greek letter, the star nearest to the zenith being Delta, the next Gamma, then Epsilon, and the last Zeta Cygni. To the north of Gamma, Alpha Cygni, or Deneb, shines as a star of the first magnitude; but this object is included in the northern half of the sky, and consequently will be found in the upper map. Between Cygnus and the eastern horizon the space is occupied by the constellation Pegasus, one half of which at midnight is south, and the other half north of the imaginary line separating the two halves of the sky. Several bright stars in Pegasus can be seen near the horizon in the east. Three of these, together with the principal star in Andromeda, will form conspicuous objects in future diagrams, the combination being popularly known as the square of Pegasus. Between Aquila and Pegasus two small constellations, Equuleus and Delphinus, may be noticed, the latter more especially by a group of fourth and fifth magnitude stars. The horizon from due east to due west is occupied by several of the signs of the zodiac, the constellations, commencing from the east, being Aquarius, Capricornus, Sagittarius, Scorpio, Libra, and Virgo, the last-mentioned extending to a little north of west.

The principal stars on the meridian at this time are those in Ophiuchus, the chief object in which is Ras Alague, or Alpha Ophiuchi, about forty degrees from the zenith. Between Ophiuchus and the zenith the space is occupied solely by the constellation Hercules, which extends to a point very near the two bright stars in the zenith, Beta and Gamma in Draco. Ophiuchus spreads over a large portion of the sky on each side of the meridian, and reaches nearly to the south horizon. Excepting two or three stars near Ras Alague of the third magnitude, there is very little to attract the attention of observers in this constellation. West of the meridian, several well-known objects, the positions of which we have pointed out in the descriptions of the diagrams of preceding months, are still very conspicuous. First, near the horizon in the W.S.W., but out of the limits of our diagram, Spica, and other bright stars in Virgo, are on the point of setting. Arcturus, and a few other tolerably large objects in Boötes, are now a little south of west, about forty degrees from the horizon. They can be readily found by the ruddy appearance of Arcturus. Between Arcturus and the meridian, Alphecca and its companions, forming the Northern Crown, can be easily observed by the regularity and compactness of form of that small constellation. Directly south of Corona Borealis, and exactly midway between the zenith and horizon, Serpens, with a group of several bright objects, can be seen, the principal star being between the second

and third magnitudes. This portion of the heavens, including Hercules, Serpens, and part of Ophiuchus, is peculiarly rich in stars of the second class. Near the S.S.W. horizon, the constellation Scorpio, with its bright star Antares, a few of the second and third magnitudes, and more than usual of the fourth and fifth, can now be easily recognised. In June, 1868, the planet Saturn will still be found among the stars in Scorpio. Alpha and Beta Libræ are also visible, but they are within a short time of setting. Libra occupies the greater part of the south-western horizon.

The principal constellations in the south half of the midnight sky of London, in the middle of the month of June, may be briefly enumerated as follows:—Hercules, Lyra, Corona Borealis, Vulpecula, Sagitta, Delphinus, Equuleus, Aquila, Ophiuchus, Serpens, and Libra; and parts of Boötes, Cygnus, Pegasus, Coma Berenices, Virgo, Scorpio, Sagittarius, Capricornus, and Aquarius.

Serpens is one of the forty-eight ancient constellated groups, and extends over a considerable portion of the sky; the head, which is under Corona Borealis, is well marked by several stars of the third magnitude; the body winds through Ophiuchus, and the tail reaches the Milky Way near Aquila. Its principal star, Alpha Serpentis, of the second and a half magnitude, was known to the ancients by the name of Unukalkay, and by the astrologers of the middle ages as Cor Serpentis, or the heart of the serpent. This star is of a pale yellow colour, and is closely followed by a very small telescopic object, first noticed by Sir William Herschel, with his twenty-foot reflector. In the catalogues of Ptolemy and Copernicus this constellation is made to consist of eighteen stars, all of which were clearly visible to the naked eye; Flamsteed increased this number to sixty-four, while the atlas of Bode contains 187. Most of the principal stars in Serpens are situated in or near the head; Alpha is, however, in the fore-part of the body, a short distance below the head. The reader can easily identify the last-mentioned star in the diagrams of the south sky, by drawing a straight line from Alpha Aquilæ, or Altair, east of the meridian, through Alpha Ophiuchi, or Ras Alague, on the meridian, to a corresponding distance west of the meridian, when it will pass through, or very near, Alpha Serpentis. Or, if we have recourse, as on other occasions, to the rhymester, the upper part of the body of the serpent may be clearly pointed out by reference to the same stars:—

“To strike th’ insidious Serpent’s heart,
A line from Altair wield,
From thence below Ras Alague,
Across th’ Arabian Field;
And when as far again you’ve reached,
As those two stars may be,
The middle one of three fair gems,
Serpentis Cor you’ll see.”

Libra, the Balance, is the first autumnal sign, and the seventh in order of the twelve signs of the zodiac. This constellation is bounded on the east by Scorpio, on the south by Centaurus and Lupus, on the west by Virgo, and on the north principally by Serpens. According to Ptolemy, it contained only seventeen stars visible to the naked eye; but in the atlas of Bode, 180 are inserted. The position of the two scales is pointed out by the two principal stars, Alpha and Beta, the former being exactly midway between Spica and Antares. Alpha Libræ is of the third magnitude, and of a pale yellow colour, preceded by a star of the sixth magnitude. Beta Libræ, a pale emerald-coloured star, is of the second magnitude, situated a short distance to the north-east of Alpha. The Balance was considered of old to typify the equality of the autumnal days and nights, as well as

the general uniformity of temperature at that season of the year. The sign of Libra has been the subject of a difference of opinion among astrologers, some of whom have placed it among their lucky signs, while others have classed it, owing to its proximity to Scorpio, among those least beneficial to human interests. An illustration of the latter has been gathered from an old illuminated almanack bearing the date of 1386, in which it is calmly stated that “whoso es born in yat syne sal be an ille doar and a traytor.” Libra contains several interesting double and triple stars, and two clusters. One of the clusters, No. 5, Messier Libræ, is a beautiful object over the beam of the Balance. Through telescopes fitted with a low magnifying power, this superb cluster has the appearance of a round nebula. When Messier observed it first in 1764, he described it as such, adding the remark, “I am certain that it contains no star.” But when Sir William Herschel, in May, 1791, directed his great forty-foot reflecting telescope to it, he found it resolved into separate stars, of which he counted no fewer than 200. At the same time, the central mass was so compressed, that he was not able to resolve that part of the cluster, so as to distinguish the different components.

Scorpio, the Scorpion, is the eighth sign in order of the zodiac, and one of the forty-eight old constellations. Of its origin we have been informed by the ancient poets of Greece, that the Scorpion was sent by Diana to destroy Orion for interfering with the duties of her office. Ovid, however, tells us “that this Scorpion was produced by the earth to punish Orion’s vanity for having boasted that there was not on the terraqueous globe any animal which he could not conquer.” The autumnal season of the year has also been fitly represented by the Scorpion, for whereas the former produces in abundance all kinds of fruits which are frequently the parents of many diseases, so the latter, as he recedes on his path, is supposed to inflict all manner of wounds with his tail. Scorpio is bounded on the east by Sagittarius, on the south by Lupus, Norma, and Ara, on the west by Libra, and on the north by Ophiuchus and Serpens. Antares, called also Cor Scorpæ (the heart of the scorpion), is the chief star in this constellation, and is a small first-magnitude star, preceded by a very close companion of a bluish colour. Antares shines with a deep red light, and may be found readily by drawing a line from Vega, through Ras Alague.

“Through Ras Alague, Vega’s beams direct th’ inquiring eye,
Where Scorpio’s heart, Antares, decks the southern summer sky.”

Antares, with Aldebaran in Taurus, Regulus in Leo, and Fomalhaut in Piscis Australis, were looked upon by the ancient Persians as the guardian stars of the heavens, dividing the celestial sphere into four equal parts. When Aldebaran was in the vernal equinox, and the guardian of the eastern sky, Antares was in the autumnal equinox, with a like charge of the western sky. Regulus being near the summer, and Fomalhaut the winter solstice, these two stars overlooked the northern and southern portions of the heavens respectively. At the present date, these four stars no longer hold these prominent offices, as the equinoxes and solstices are now in very different parts of the heavens, on account of their retrogression, produced by what is technically called “the precession of the equinoxes.” In like manner, we can imagine how much the position of the first point of Aries, or the vernal equinox, will be changed in future ages with respect to the stars. Even at the present time, this point is no longer in Aries, but has penetrated some distance into Pisces.

Scorpio is not a large, but it is a very brilliant con-

stellation. Besides Antares, it contains Beta Scorpii, or Iklil, a star of the second magnitude, with an interesting close companion of the sixth magnitude. Scorpio also includes a great number of stars from the third to the fifth magnitudes. This general brilliancy was certain to attract the attention of the astrologers and soothsayers of the early and middle ages. On this subject, the late admiral Smyth remarks, in his "Celestial Cycle," that Scorpio was always looked at as a group

INDEX-MAP, LOOKING NORTH, JUNE 15.

of stars portending universal evil. He says "Scorpio attracted much notice from the corps of astrologers, with whom it was the 'accursed constellation,' and the baleful source of war and discord; for, besides its being accompanied by tempests when setting, it was of the watery triplicity, and the stinging symbol of autumnal diseases, as it winds along with its receding tail. But though stigmatised as 'the false sign' by seers of every degree, the redoubtable Gadbury, at whose birth it ascended, broke many a lance in its defence, and stoutly contended for its beneficial influences; and the alchemists were well assured that the transmutation of iron into gold could only be performed when the sun was in that sign."

Corona Borealis, or the Northern Crown, is a small

INDEX-MAP, LOOKING SOUTH, JUNE 15.

constellation between Boötes and Hercules. It consists principally of the group of well-known stars in the form of a crescent, the position of which, and the means of finding it, we have already described. Its principal star, Alphecca, or Gemma, is of the second magnitude,

and is situated in the centre of the front of the crown, as the most precious stone in the diadem. Four stars are of the fourth magnitude. This constellation, confined as it is within a very limited space, contains, nevertheless, some interesting objects, including three binary, in addition to other double stars, and also a triple and a quadruple star. Corona Borealis is one of the ancient asterisms, and is supposed to have derived its name as far back as the date of the origin of the zodiacal signs. It was also considered to be the crown of the virgin, from its rising immediately after Virgo. According, however, to the mythology of the Greeks, the origin of the name arose from the circumstance of a beautiful crown having been presented by Bacchus to Ariadne, daughter of Minos, King of Crete. On the death of Ariadne, who had become the wife of Bacchus, and as a memorial to her honour, this crown was placed among the stars, forming the constellation Corona Borealis. By reference to other stars, there are various ways by which this group can be pointed out. One of them is by passing a line from the last two stars in the tail of the Great Bear, through the northern part of Boötes, when it will pass a short distance south of the group. In the spring months, the following alignment in rhyme will also serve this purpose, Epsilon Virginis, referred to in the first line, being the most northerly conspicuous star in Virgo above Spica:—

"From epsilon in Virgo's side Arcturus seek, and stem,
And just as far again you'll spy Corona's beauteous gem:
There no mistake can well befall e'en him who little knows,
For bright and circular the Crown conspicuously glows."

It was near Epsilon Coronæ Borealis, the most easterly star of the principal group, that a most extraordinary temporary star suddenly appeared on May 12th, 1866, shining equal to one of the second magnitude. The first trustworthy observation was made at Tuam, Ireland, but it was on the same and subsequent days discovered independently in various parts of Europe, North America, and India. When first noticed, its lustre equalled Alphecca, but the daily diminution of brightness from the day of discovery was very rapid, amounting for some time to an average rate of half a magnitude each day. Within a month it decreased to the ninth magnitude, to a mere point even when viewed through our principal telescopes. This wonderful object is all the more curious from the circumstance that it is a catalogued star observed by M. Argelander, of Bonn, in the years 1855 and 1856, and noted by him as of the ninth and a half magnitude. From the sudden outburst of this star, which was not previously suspected of variability, astronomers have been led to consider that it most probably had been subject to some catastrophe, the effects of which first became apparent to us in May, 1866. If the outburst consisted of inflammable gas, the star would naturally return to its normal size as soon as the gas was completely consumed. From the second week in June till the middle of August, the star continued of the ninth magnitude; but in the autumn of 1866, the light of the star again increased for a few weeks, and then resumed its ordinary appearance, as first observed in 1855 by M. Argelander. It has been frequently examined since, but no appreciable change has been noticed. As a proof that something peculiar has been going on in this hitherto comparatively insignificant object, it may be stated that the analysis of its light, as viewed through a spectroscope, has not only exhibited the dark lines of the spectrum similarly to those in the spectra of other stars; but in addition, a series of bright lines has been observed, indicating that the light by

W

E

W

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, JUNE 15.

which the secondary spectrum was formed, was emitted by matter in a state of luminous gas. The position of one of the bright lines was coincident with that found from the analysis of the light produced from the combustion of hydrogen gas. Many explanations, or rather speculations, have been given concerning the origin of this remarkable outburst, but nothing of a decided nature has been published. It may possibly be a variable star analogous to those which are known to have their regular periods of increase and diminution of lustre; but still its peculiar double spectrum must naturally lead us to infer that the surface, or more probably the atmosphere, of this distant globe, has been subjected to a conflagration of some kind, or, as it has been aptly termed by the Rev. C. Pritchard, the late president of the Royal Astronomical Society, "the atmosphere of a world on fire." The position in the heavens of this curious object, as well as its relative size with respect to the stars in Corona Borealis, can be readily seen by reference to the accompanying small diagram, in which the new star is inserted at its maximum magnitude, as observed on the night of its discovery.

CHART SHOWING THE POSITION OF THE NEW STAR IN CORONA BOREALIS.

A few stars have lately been examined, whose spectra show bright lines very similar in their nature to those of this temporary star in Corona Borealis, and consequently differing considerably from the general stellar spectrum in which black absorption lines only are visible. M. Secchi first pointed out Gamma Cassiopeiæ as one of these abnormal stars, and MM. Wolf and Rayet have since added three others of small magnitude, very near each other in Cygnus, to the list.

We will now transfer our attention briefly to the upper map, which is illustrative of the midsummer midnight sky of London north of the zenith. First, let us look directly overhead, where the two stars Beta and Gamma Draconis will be noticed as the brightest objects in the immediate neighbourhood, the more westerly star being Beta. Draco at this time occupies nearly the whole of the sky near the meridian between the zenith and Polaris, and all the stars as far as the Lesser Bear belong to that constellation. Commencing at Polaris, the form of Ursa Minor can be traced to the two bright stars, Kocab and Gamma Ursæ Minoris, which are a short distance west of the meridian in the direction of the zenith. The space between these stars and Charles's Wain, in Ursa Major, is also occupied by a part of Draco, which winds its way almost to the north side of Polaris. Confining our remarks at present to the stars west of the meridian, the principal constellations which fall under our view are, in addition to

Draco and Ursa Minor, the whole of Ursa Major, Canes Venatici, Coma Berenices, Leo Minor, and Lynx, with portions of Boötes, Leo, and Auriga. The seven principal stars of Ursa Major now occupy the north-west sky, the pointers Dubhe and Merak being about midway between the zenith and horizon. Below Ursa Major, and near the horizon in the north-west, but out of the range of the diagram, portions of Leo and Leo Minor may be seen with some of the bright stars of Leo near the horizon. Looking due west from the two stars in Draco in the zenith, and passing down to the horizon, we traverse more or less through Hercules, Boötes, Canes Venatici, Coma Berenices, and Virgo, the last-mentioned being in the horizon. Below Ursa Major in the N.N.W., Lynx is situated, while in the north horizon the meridian divides the constellation Auriga, and its two bright stars, Capella and Beta Aurigæ, the former being slightly east, and the latter slightly west of due north.

The sky east of the meridian includes the whole of Cepheus, Cassiopeia, Andromeda, and Lacerta, and considerable portions of Perseus, Cygnus, Draco, Pegasus, Pisces, and Camelopardus. Let us now look due east from the two zenithal Draconian stars. At about one-third of the distance to the horizon, the eye will fall on Alpha Cygni, or Deneb, and near the horizon, on the bright stars of Pegasus. The stars of the latter constellation are now outside of the limit of this month's diagram, but they will in future appear in the views of the south sky. The most attractive constellation in the north-east is Cassiopeia, which is about midway between the horizon and zenith, having Cepheus above, and Perseus and Andromeda below. The principal stars in Perseus, including Alpha Persei, and Algol, are visible near the N.N.E. horizon, east of the conspicuous stars Capella and Beta Aurigæ.

The relative positions of the constellations which we have been describing, will be precisely the same with respect to the meridian and horizon, at other hours than midnight, in preceding and succeeding months of the year. Consequently our diagrams for June are also available for comparison with the heavens at 10 P.M. on July 15th, at 8 P.M. on August 15th, at 6 P.M. on September 15th, at 6 A.M. on March 15th, at 4 A.M. on April 15th, and at 2 A.M. on May 15th.

The short nights of summer are not generally favourable for the observation of the planets, but on June 9th, 1868, Venus is at her greatest brilliancy, and is therefore the most magnificent of all the stars soon after sunset during the month. She is in the constellation Cancer in the north-western sky, and can be recognised long before any other star becomes visible. Venus sets below the horizon about twenty minutes before midnight on the 1st, at 10.38 P.M. on the 15th, and at 9.20 P.M. on the 30th.—Mercury is also an evening star, and in a very clear sky may be seen after sunset near the north-west horizon. In the beginning of the month he sets about two hours after the sun, and at the end one hour. The only favourable time for observing Mercury with the naked eye is, therefore, on evenings before the 20th of the month.—Mars is a morning star, rising on the 1st at 2.32 A.M., on the 15th at 1.56 A.M., and on the 30th at 1.23 A.M.; he will consequently be visible in the north-east sky among the stars in Aries, shortly before sunrise.—Jupiter is a conspicuous morning star in the constellation Pisces, and rises on the 1st at 1.42 A.M., on the 15th at 0.45 A.M., and on the 30th at a quarter of an hour before midnight.—Saturn continues in Scorpio, and is visible to the naked eye very nearly

throughout the night hours. He is on the meridian before midnight, and sets on the 1st at 3.50 A.M., on the 15th at 2.48 A.M., and on the 30th at 1.47 A.M.—Uranus is above the horizon during the day-time, and is therefore unfavourably situated even for telescopic observation.

At the beginning of June the moon will be in Virgo; on the 2nd she enters Libra, on the 3rd Scorpio, on the 5th Sagittarius, in which sign she remains till the 7th; on the 8th and 9th she is in Capricornus; from the 10th to 12th in Aquarius; and on the 12th she enters Pisces. From this day she rises after midnight, and during the remainder of the lunation she is visible for a few days only before sunrise. Full moon takes place on the 5th, at 6.55 A.M.; last quarter on the 13th, at 10.14 A.M.; new moon on the 20th, at 2.45 P.M.; and first quarter on the 27th, at 5.51 A.M. Two days after new moon she may be seen as a very fine crescent in the north-west in Cancer, near the planet Venus. On the 23rd she enters Leo; from the 25th to 28th she is in Virgo, and in Libra at the end of the month. On the morning of the 10th she is in apogee, or at her greatest distance from the earth, and on the 22nd she is in perigee, or at her least distance from us.

TEMPLE BAR.

THE history of the Bar, or rather Bars (for there were more than one, which, receiving their name from the adjacent Temple, separated the freedom of the City of London from the liberty of the city of Westminster), is very obscure. Anciently this separation was made by posts, rails, and a chain similar to those which formerly were placed at Holborn, Smithfield, and Whitechapel. It is, however, at this distance of time, impossible to ascertain, with any certainty, when they were removed, and a house of timber, extending across the street, erected. This timber house had a narrow gateway, and one passage only through the south side of it for foot-passengers.

In the royal progress of Henry VIII and Anne Boleyn to Westminster from the Tower of London*, on Saturday, May 31st, 1533, preparatory to her coronation on the Whit Sunday following, we find the first mention of a Bar, or house of timber, in Fleet Street.

After describing various scenes in the Triumph, at notable points of the route, the old chronicler, Edward Hall, tells us that "Temple Bar was newly painted and repaired; and there also stood divers men and children, and so the company rode to Westminster Hall."

Anne Boleyn was the last of Henry VIII's crowned queens. No further mention of the Bar is made in this reign, and we have to follow the son of Queen Jane Seymour, the youthful Edward VI, to his coronation, to find the next notice of this City entrance. On February 19th, 1547, the Gate, we are informed, made a gay and handsome appearance, "being painted and fashioned with battlements and buttresses of various colours, richly hung with cloth of arras, and garnished with fourteen standard of flags; there were also eight French trumpeters, blowing their trumpets, after the fashion of their country, and a pair of regals with children singing to the same." Edward, however, was not long to wear the crown; of a feeble constitution, he died of consumption at Greenwich, in the sixteenth year of his age, and the seventh of his reign. Mary Tudor, his half-sister, succeeded him; and, in accordance with

ancient custom, on September 27th, 1553, being the day prior to her coronation, she rode through the City, *not* as her predecessors had done, on *horseback*, but in a chariot of cloth of tissue, drawn by six horses, trapped with the same; and we find that Temple Bar was then "newly painted and hanged."

It is in this reign, also, that we have discovered in the City Records the first entry of any matter connected with the Bar; it is as follows:—

"Oct. 23, 1554. I. and II. Philip and Mary.

"Mr. Chamberlain shall commit the custody of the new Gates at Temple Bar to the Cittie's tenants dwelling nigh unto the said gates, taking nevertheless especial order with them, for the shutting and opening the same gates at convenient hours."

Wyatt and his followers had, probably a few months previously, in his ill-contrived rebellion, destroyed, or so damaged the old Gates in forcing his way into the City, that the civic authorities were compelled to erect new ones, the care of which, by the above resolution, devolved on those of the City's tenants who were living adjacent to them.

In the reign of Queen Elizabeth, Temple Bar again bore its share in the pageantry set up to celebrate the royal passage from the Tower to Westminster. It was honoured, on this occasion, with the presence of the two giants from Guildhall, Gotmagot the Albion and Corinaus the Briton, who held between them a poetical recapitulation of the pageantries, both in Latin and English. The Bar put on its gayest attire; "on the south side was a noise of singing children, one of whom, richly attired as a poet, gave the Queen farewell in the name of the whole City."

Time passed on, and with it the Augustan age of pageantry; and for the next hundred years no entry is found in the civic records relating to Temple Bar.

Triumphal arches were raised to welcome James I to the capital of his newly-acquired kingdom, as well as on the return of his grandson, Charles II, after his banishment from it. Little mention, however, is made of the Timber House which stood across the street; and three scourges had visited the nation, civil war, pestilence, and fire, before we again meet in the City Records with any mention of it; and now it is not for its safe keeping, but for its destruction, that the Court of Aldermen and Common Council ordered:—

"1669. 21 Car. II. July 29th.

"The Commissioners of Streets and Sewers, sitting at Scotland Yard, have several times proposed the opening and taking down of Temple Barr, for enlarging the streets there, and to pay the sum of £1005 out of the revenue arising by Hackney Coaches, to satisfy the City, and such as claim under them for their respective estates in the houses, and rebuilding over and adjoining to the said building, and towards the charge of taking down and rebuilding the same; to which this Court hath hitherto declined to agree to, in regard, it appears, upon a due estimate and computation, that the charge of that work will far surmount the said sum. Now this day the Lord Mayor made relation unto the Court that his Lordship was sent for to appear before his Majesty in Council on Friday last, upon his Majesty's demand did offer his charge before mentioned as the reason why the said Temple Barr was not taken down withal, respecting the great sum of money the City had expended towards the rebuilding their public works consumed in the great dismal fire, amounting already to about £80,000, for all which they are thereby clearly indebted, and how great a sum is yet further necessary to the works remaining, with other instances of this City's present weak estate and inability. But that His Majesty did nevertheless insist upon taking down of the said Barr and Buildings, and signifying his pleasure several times to that purpose, and that towards the said charge the City should accept the said £1005, but was pleased afterwards to declare that when that sum was expended he would take care they should be further supplied, either out of the said revenue by Hackney Coaches or otherwise, for reviving or finishing that work.

It was ordered—"That Mr. Chamberlain should receive the sum of £1005 towards the rebuilding of the said Barr."

In pursuance of this resolution the work of destruction shortly commenced, and the old timber house was speedily demolished, and the stone gateway (completed

* From a very early period of our history, it had been the custom of our kings and their consorts to sleep in the Tower the night prior to their coronation.

in 1672, after the designs of Sir Christopher Wren) occupied its place.

The old house, as we have seen, had ever been associated with scenes of joy and festivity, whilst the one now erected by royal command was to be noted for exhibitions of a sadder sort.

occupant, let us describe the structure. "The gate," says Stow, in his Survey, 1720, "is built of Portland stone, of rustique work below, and of the Corinthian order. Over the gateway on the east side, fronting the City of London, in two niches are the effigies in stone of Queen Elizabeth [an error for Queen Anne of Denmark,

FLEET STREET AND TEMPLE BAR IN 1867.

In the early days of English history, the north, and subsequently the south tower on London Bridge, from their public position, had been considered favourably adapted for striking terror into the hearts of the rebelliously inclined, by the display of the lifeless heads of those who had fallen under the severity of the laws of high treason. The heads of Sir William Wallace, More, and Fisher had been thus affixed on the northern tower, whilst the heads of the regicides and the fifth-monarchy men were the last that frowned from the southern or Southwark tower.

In the fire of London, in 1666, much of the unhappy old bridge was destroyed. No more heads were ever again exhibited on London Bridge. Temple Bar, on its erection, was chosen by the Crown to convey the moral lesson to the public, and for nearly a century it was seldom, perhaps never, free from these black and decaying fractions of humanity.

Previous to our introducing to its summit its first

wife of James I] and King James I, very curiously carved, and the King's arms over the key-stone of the gate; the supporters being at a distance over the rustique work. And on the west side, fronting the City of Westminster, in two niches, are the like figures of King Charles I and King Charles II in Roman habits. Through this gate are two passages for foot-passengers: one on the south, over which is engraven, 'Erected, Sir Samuel Starling being Maior;' and another on the north, over which is engraven, 'Continued, Sir Richard Ford, Maior. Finished, Sir George Waterman, Maior.'

It was completed, as we have already stated, in the year 1672, and had attained the immature age of eleven years, when in the mayoralty of Sir William Pritchard, 1683, it was destined to impart its first moral lesson. In the summer of that year, one of the quarters of Sir Thomas Armstrong, executed for connection with the Monmouth rebellion, was displayed on a spike on its summit. His head being set up upon Westminster Hall, between

those of Cromwell and Bradshaw, one of the quarters upon *Temple Bar*, two others on Aldersgate and Aldgate, the fourth was sent down to Stafford, which borough he had represented in Parliament.

Twelve years elapsed before the Bar received another ghastly contribution. The House of Stuart had then ceased to reign; William III sat alone on the throne. The death of Mary had revived the hopes of the Jacobite party, and towards the close of the year 1695 a scheme for assassinating the King, and an invasion from France, was concocted by a few of the most daring adherents of James. The plot, however, was discovered when on the eve of execution. The chief parties engaged in this transaction in England were Sir George Barclay, a native of Scotland; Sir John Friend, a brewer in the Minorities; and Sir William Parkyns, a clerk in Chancery. Sir George Barclay escaped, and was never taken; Sir John Friend and Sir W. Parkyns were speedily apprehended, tried, and found guilty of high treason, and executed at Tyburn on the 3rd of April, 1696. The quarters of Sir William Parkyns and Sir John Friend, together with the head of the former, were placed on *Temple Bar*.

Evelyn, in his "Diary," referring to this melancholy scene, remarks—"A dismal sight, which many pitied. I think there never was such a *Temple Bar* till now, except once in the time of King Charles II, viz. Sir Thomas Armstrong."

Anne, the last of the Stuart Queens, grand-daughter of the great Lord Chancellor Hyde, died childless in 1714; and George I, a Prince of the House of Hanover, peacefully ascended the throne. Little probability, however, existed of his being permitted to retain quietly that crown which by virtue of the Act of Settlement he had acquired. Civil war was decided upon, and the "Rising" of 1715 took place. The Bar—the stone book of the social history of England during this century—quickly recorded their "Rising" by displaying to the crowds who passed to and from the City the head of another of King James's friends, Joseph Sullivan, who had been tried, condemned, and executed at Tyburn for enlisting persons in the service of the Pretender, as James III was then called. The defeat at Preston provided a second head for the Bar—Colonel Henry Oxburg, executed at Tyburn on the 14th day of May 1716, and whose head gazed on the crowd from the top of the Bar on the 16th of the same month, "which is a circumstance," remarks a writer of that day, "which we choose to mention, that the rebels may place it among their other saint days."

Christopher Layer or Counsellor Layer, as he was familiarly named, is the next name associated with *Temple Bar*. On the 17th May 1723, he was executed at Tyburn for conspiring in behalf of the Pretender. The day subsequent to his execution, his head was placed on *Temple Bar*; there it remained, blackened and weather-beaten with the storms of many successive years, until it became its oldest occupant. A generation passed, and infancy had advanced into mature manhood, yet, despite the lapse of time, still that head repulsively looked down from the summit of the arch. For upwards of thirty years it remained, till the elements accomplished what the improving taste of the public had in vain demanded. On one stormy night a summary ejection was served, and the head of Layer left its long resting-place, and descended from the arch into the Strand. We extract from Mr. Nicholls' "Literary Anecdotes of the Eighteenth Century," the sequel of this curious history. "When the head of Layer was blown from *Temple Bar*, it was picked up by a gentle-

man in the neighbourhood (Mr. John Pierce, an attorney), who showed it to some persons at a public-house, under the floor of which, I have been assured, it was buried. Dr. Rawlinson, meanwhile, having made inquiries after the head, with a wish to purchase it, was imposed upon with another instead of Layer's, which he preserved as a valuable relique, and directed it to be buried in his right hand, which request was complied with." This Dr. Rawlinson, we may observe, who was so greatly attached to the House of Stuart, was one of the first promoters of the Antiquarian Society; he was the third son of Sir Thomas Rawlinson, Lord Mayor of London, 1706. Dr. Rawlinson died April 5th, 1755, and by his will ordered his body to be buried in a vault in St. Giles's Churchyard, Oxford, and his heart in St. John's College, as a mark of his affection.

Years pass on without our being able to meet with any joyous reminiscences of the Bar. Its records only tell of mourning and sorrow. The "Rising of '45" had taken place—the battle of Culloden had been fought. In the number of prisoners taken and brought up to London for trial, were two whose heads were to be the last set up on the gate. The public mind was becoming impressed with the idea that no great moral improvement had hitherto been effected by habituating the public to these horrid, ghastly spectacles. It was destined, however, to another trial, and Francis Towneley, a younger son of the old, honourable, and still flourishing Lancashire family of Towneley of Towneley, whose grandfather had fought and died for King Charles at the fatal battle of Marston Moor, and George Fletcher, of a good family at Salford, near Manchester, who had purchased a captain's commission in the Pretender's army, were tried, with several others, and found guilty of high treason. On the 30th day of July, 1746, they were executed at Kennington Common, and their heads removed to *Temple Bar*.

For several weeks, curiosity induced numbers to gather about the arch, to gaze on those livid features which life and health had so recently animated. Glasses were let on hire, that the morbid feelings of the masses might be indulged by a closer examination.

Of a character far more refined and intellectual is the following anecdote, related by Dr. Johnson, in reference to this subject. "I remember," said the great lexicographer, "being, on one occasion, with Goldsmith in Westminster Abbey. While we surveyed the Poets' Corner, I said to him, from Ovid—

'Forsitan et nostrum nomen miscebitur istis.'

When we got to *Temple Bar*, he stopped me, pointed to the heads upon it, and silyly whispered to me—

'Forsitan et nostrum nomen miscebitur istis.'

These were the last fractions of humanity that *Temple Bar* was destined to receive. Before other treasonable attempts had subjected their promoters to well-merited punishment, society had undergone a great change. The idea had acquired the force of conviction that these unhappy spectacles, instead of elevating, degraded the moral condition of the people. Again, a few years, and the gibbets on our commons, and the dry bones suspended from them, were for ever removed from the public gaze.

We have little more to say of the ghastly occupants of the Bar. We find, however, the following curious statement in the "Annual Register" for January, 1766:—

"This morning (Jan. 20th), between two and three o'clock, a person was observed to watch his opportunity of discharging musket-balls, from a steel cross-bow at the two remaining heads upon *Temple Bar*.

On his examination he affected a disorder of his senses, and said his reason for his so doing was his strong attachment to the present Government, and that he thought it was not sufficient that a traitor should only suffer death, and that this provoked his indignation; and that it had been his constant practice, for three nights past, to amuse himself in the same manner. But it is much to be feared that he is a near relation to one of the unhappy sufferers." The account given in the "Gentleman's Magazine" further states, "Upon searching him, about fifty musket-balls were found wrapped in a paper, with this motto, *Eripuit ille vitam*."

No further efforts appear to have been made, either by the friends or enemies of the reigning family, either by the sane or the insane, to dislodge these grim tenants of the Bar. There they remained until the 31st of March, 1772, when one of them fell down, and, we believe, very shortly afterwards, during a high wind, the remaining head was swept from its lofty position, and Temple Bar remained untenanted.

Mr. John Taylor, however, remarks, in the "Records of my Life:"—"It was not to the wind alone that the removal of this head is to be attributed. Mr. Charles Towneley, a gentleman long distinguished for his love of the fine arts, and to whom the nation is indebted for the noble collection of marbles known as the Towneley Marbles, was the nephew of the unfortunate gentleman who was beheaded for high treason, and whose head I remember to have seen placed upon a pole on the top of Temple Bar. As this exhibition was painful in no slight degree to Mr. Towneley, some of his friends, among whom was the Rev. John Penneck of the British Museum, formed a plan for removing it; and one night, which happened to be a very windy one, they effected their purpose without interruption. No inquiry was made, as it was inferred that the head had been blown off by the storm. Mr. Towneley had therefore the melancholy pleasure of having deposited the head in the tomb of his ancestors." Mr. John Taylor died in May, 1832, at the age of seventy-six.

From this time it is pleasing to record that the Bar is no longer associated with the criminal history of the country. True, its days of sorrow are not over, but when it again mourned, it was with a whole nation. On the 9th January, 1806, when the body of the illustrious Nelson was borne to St. Paul's Cathedral on an open funeral car, Temple Bar was surrounded by a weeping multitude. The old stone gateway, however, looked on, cold and apathetic; for on this occasion no sombre drapery concealed its time-beaten form—no flambeaux blazed from its summit.

In order solely that some civic formalities might be observed requiring the closing of the doors, it became necessary to affix new ones. The old pair had not been shut for a long series of years, and were in a complete state of decay, literally rotting from the hinges. Here the Lord Mayor, Aldermen, and other City authorities, with royal ceremony, received the procession, and accompanied it to St. Paul's Cathedral, where, amidst one universal heartfelt sense of grief, the body of Nelson was deposited in a vault under the spacious dome.

In order that grief may not intrude on our few days of joy and festivity, we shall deviate from that chronological order which we have hitherto observed, and pass at once from the obsequies of England's greatest naval hero, to the death of her most illustrious warrior, Arthur, Duke of Wellington.

Temple Bar, arrayed in the sable trappings of woe on that cold raw morning of the 18th November, 1852, presented the appearance of a Roman decorated arch.

Full descriptions appear in contemporary publications of the aspect of the old gate on this grand and solemn occasion:—

"The deep black of the large central curtains was relieved by several monograms of the Duke, the letter W being enclosed in an oval of laurel. Above and suspended from the laurel wreaths were the Duke's Orders of the Garter, the Bath, and the Golden Fleece, etc. The whole of the ornaments and decorations were composed of papier mâché, gilt in silver.

"Temple Bar then appeared as a funeral arch; but all the decorations were emblematical of triumph, as well as of mourning, and indicated not only the warrior but the victor. The black cloth and velvet, richly relieved by the silver cornices, irons, flambeaux and trophies, produced an effect of rich but chaste solemnity, admirably adapted to give impressiveness to the entry of the magnificent funeral procession into the City of London.

"The plumes and ornaments of the funeral car rose so far above the coffin, that a mechanical contrivance was necessary to lower them, in order to admit of its passing through the gateway." This being cleverly effected, the pageant moved on to St. Paul's, in outward form magnificent. On its arrival there, the coffin of the illustrious Duke was deposited under the noble dome of the cathedral, in the crypt where repose the remains of the immortal Nelson. The Tower guns fired, and the ceremony ended.

"Who so sepulchred, in such pomp doth lie,
That kings for such a tomb would wish to die,"

We now bid farewell to death and state funerals, to sorrow and grief, as connected with the Bar; the memorials we shall have to record in our few remaining notes breathe solely of joy and gladness; they are only, we regret, so few in number. We have first the loyal reception given by the City to the best of queens, our own Queen Victoria, when, in accordance with ancient custom, she honoured with her presence the banquet given by the Lord Mayor, on the first ninth of November after her accession to the throne. A maiden on that ninth of November, 1837, sorrow had not touched her young heart, no fatal abiding remembrance had then thrown its bleak shade o'er her life. On she came in beauty and happiness, surrounded by all the pageantry of state, hundreds of banners waved from the houses, thousands of voices bade her welcome.

On the arrival of Her Majesty at Temple Bar being announced, shortly before three o'clock, the Lord Mayor, in accordance with the ceremonial observed on the occasion of royal visits to the City, dismounted from his charger, and, taking the City sword in his hand, stood on the east side of the gate; as soon as the Queen's carriage arrived within the gateway, it stopped, and the Lord Mayor delivered the keys of the City to the Queen, which Her Majesty restored in the most gracious manner. The Lord Mayor then remounted, and, holding the City sword aloft, took his place immediately before the royal carriage, after which the Aldermen, Members of the Common Council, and civic authorities formed in procession. The banquet took place at the Guildhall, at five o'clock, and at half-past eight Her Majesty left, but not in the state observed in the morning.

Whilst the feast was being held, and mirth and festivity filled the Hall, the good citizens of London, anxious to display their loyalty and affection to the Crown, had illuminated their houses on the line of procession, and the old Bar, for the first time in its history, was made to participate in the universal joy. How cheerful it looked on that night! On the east was an

imperial crown, bearing the inscription, "Welcome, Royal Guest," in green and yellow lamps, surrounded by lamps arranged in festoons, branches, and pillars, with the royal arms above all. On the other side were the initials V.R., of a gigantic size, flanked by stars and the arms of the City of London in the corners.

Slowly the royal carriage passed under the old arch, followed by the loyal acclamations of her people, who loved her then, and to whose early affection for their Queen revolving years, and respectful sympathy in her sorrows, have only given additional strength.

Again we have to pass over several years before we meet with any historical event of a joyous character with which the Bar is associated—the reception given by the nation on the 7th of March, 1863, to the Princess Alexandra of Denmark, on her arrival in London to become the bride of the heir to the throne of England. And right royal was this reception, the greatest outward demonstration of loyalty that has occurred in our days, or, as we are inclined to think, in those olden times, when the pageantry of royal progresses was more attended to, and therefore, we may presume, better understood than at present. The Bar was draped in crimson velvet and cloth of gold, so that not an inch of the masonry was visible. On the summit of the pediment, with its head towering far above the roofs of the houses on either side, stood a white statue of Hymen, who, armed with his torch, seemed eager to celebrate the nuptial rite. At each angle of the building was a tripod containing incense, while over the posterns were white altars beautifully sculptured, and angels holding bunches of orange-blossoms." So attractive was the Bar on this occasion, that we are told that nobody could go anywhere without first paying a visit to it.

On the Monday following, being the day on which the royal marriage was celebrated, it again made a splendid appearance, being illuminated in a marked and beautiful manner. On the pediments and cornices there were no less than 220 burners of large size, which were supplied with gas. All the statues held gas-lights, and the torches of the figures of Hymen were in a blaze. The Arch on this occasion looked splendid, and formed one of the chief attractions of the night. The brilliancy of the Arch was emblematic of the light of love, and hope, and joy, that had illumined the faces and cheered the hearts of a whole nation.*

* We are indebted for the foregoing notes to James Holbert Wilson, Esq., of the Inner Temple, author of "Temple Bar: a Narrative of the Historical Occurrences of a Criminal Character associated with the Present Bar." (D. Bogue.) On the subject of the removal of the Bar Mr. Wilson thus writes:—"We admit that many of the historical reminiscences of the Bar are painful, but this surely is no good reason why the Bar itself should be destroyed. Would you advocate the destruction of the Tower,

With many a foul and midnight murder fed,"

because the heads of traitors have been placed on its turrets? Would you pull down Westminster Hall because the mouldering skulls of Cromwell, Ireton, Bradshaw, and others, were fixed upon it; the head of Cromwell for upwards of thirty years? Most assuredly not. Preserve, therefore, we say, the old Bar, the only survivor of the City gates. Touch not with a rude hand a single stone. What we require is, its immediate reparation; with our Prince of Wales married to a daughter of Denmark, it would be graceful in the civic authorities to repair the broken, time-worn statue of her ancestor, Queen Anne of Denmark, the only one that exists in the metropolis, and which, in its present sadly dilapidated state, reproachfully regards them from the south-eastern niche of the Arch. The Royal arms and the arms of the City, which formerly were placed over the key-stone on the east and west sides of the gateway, have entirely disappeared; bit by bit they have decayed away, not a vestige remains; these should be replaced, and other restorations rendered necessary by long neglect, and the hand of time, at once commenced. When these are completed, the Bar in its restored condition, like as it came from the hands of Sir Christopher Wren, will again be an ornament to London, regarded with pleasure by those who love to think over the days of many generations, as well as by those who can read 'sermons in stones, and good in every thing.'

Varieties.

NEWSPAPER STATISTICS.—There are now published in the United Kingdom 1,324 newspapers, distributed as follows:—England: London, 253; Provinces, 751—1,004. Wales, 49. Scotland, 132. Ireland, 124. British Isles, 15. Of these there are 58 daily papers in England, 1 do. in Wales, 12 do. in Scotland, 13 do. in Ireland, 1 do. in the British Isles. On reference to the edition of this useful Directory for 1858, we find the following interesting facts, viz., that in that year there were published in the United Kingdom 866 journals. Of these 41 papers were issued daily, viz., 29 in England, 5 in Scotland, and 7 in Ireland; but in 1868 there are now established and circulated 1,324 papers, of which no less than 85 are issued daily, showing that the press of the country has very greatly extended during the last ten years, and more especially so in daily papers: the daily issues standing 85 against 41 in 1858. The magazines now in course of publication, including the Quarterly Reviews, number 621, of which 219 are of a decidedly religious character, representing the Church of England, Wesleyans, Methodists, Baptists, Independents, and other Christian communities.—*Newspaper Press Directory.*

TRUE WISDOM AND HAPPINESS.—He is the wisest man who lives by the Scripture rule, and endeavours to keep God's laws. His mind is in peace and tranquillity. He walks sure who keeps innocence, and takes heed to the thing that is right. He is secure, God is his friend, that Infinite Being; and He has said, "Come unto me, ye that are heavy laden, my yoke is easy." But guilt is, certainly, a heavy load; it sinks and damps the spirits. "A wounded spirit who can bear!" And the evil subtle spirit waits (I am persuaded) to drive the sinner to despair; but godliness makes a cheerful heart. Let not past errors discourage: who lives and sins not? God will judge the obstinate, profane, unrelenting sinner, but is full of compassion to the work of his own hand, if they cease from doing evil and learn to do well, pray for grace to repent, and endeavour with that measure which will be given, if sincerely asked for. Remember that to forsake vice is the beginning of virtue: and virtue certainly is most conducive to content of mind and a cheerful spirit.—*Letter of Rachael Lady Russell, to her son the Duke of Bedford, 1706.*

WAY-GOOSE.—The derivation of the term "Way-goose" is from the old English word *wayz*, stubble. Bailey informs us that *wayz*-goose, or stubble-goose, is an entertainment given to journeymen at the beginning of winter. Hence a *wayz*-goose was the head dish at the annual feast of the printers, and is not altogether unknown as a dainty dish in these days. Moxon, in his "Mechanick Exercise" (1683), tells us that "it is customary for the journeymen to make every year new paper windows, whether the old ones will serve again or no; because that day they make them, the master printer gives them a *way-goose*." . . . These *way*-gooses are always kept about Bartholomew-tide; and till the master printer has given their *way-goose*, the journeymen do not use to work by candle-light. The same custom was formerly common at Coventry, where it was usual in the large manufactories of ribbons and watches, as well as among the silk-dyers, when they commenced the use of candles, to have their annual *way-goose*. "Goose-day" is now, in nearly all the London houses, held in May or June instead of at Michaelmas, and is quite unconnected with the lighting-up.—*John Timbs. See "Notes and Queries," 2nd S., No. 83, p. 91, and No. 88, p. 193.*

SAD STATE OF ENGLAND!—For we are a people drowned in hypocrisy, saturated with it to the bone. Alas! it is even so, in spite of far other intentions at one time, and of a languid, dumb, but ineradicable inward protest against it still; and we are beginning to be universally conscious of that horrible condition, and by no means disposed to die in behalf of continuing it! It has lasted long, that unblest process—process of "lying to steep in the Devil's pickle;" for above two hundred years (I date the formal beginning of it from the year 1660, and desperate return of Sacred Majesty after such an ousting as it had got); process which appears to be now about complete. Who could regret the finis of such a thing; finis on any terms whatever!—*Thomas Carlyle.*

BRAIN FUNCTIONS.—In those of the articulated animals that are associated in families, such as the bee and ant, we observe indications of mental acts, perhaps more closely resembling those of man than those observed in any of the higher parts of the scale, but unconnected with any organ resembling a brain.—*Alison's Outlines of Human Physiology, 3rd Ed., p. 351.*

IN THE PAWNBROKER'S SHOP AT FALMOUTH.

THE MORTONS OF MORTON HALL.

CHAPTER XLII.—CALEB JAKES.

"CALEB JAKES, PAWNBROKER AND DEALER IN CURIOSITIES."

At the date of which I write, these words might have been seen, rudely painted on a rough board, over a shop in one of the poorest streets of Falmouth, which town, like all seaports, contains many miserable streets; while in smaller letters was added, "Seamen's Advance Notes Cashed."

Caleb Jakes was a thorough-bred cockney, who had

set up in business at Falmouth during the great war, in the above-mentioned lines, and in the course of a few years had accumulated sufficient wealth to enable him to open a jeweller's shop in the High Street, not many yards distant from the coach office.

In his primitive place of business, Caleb Jakes bought and sold anything and everything by which he could "turn a penny," as he phrased it, to his own advantage, and this, it was generally believed, without asking any impertinent questions of the vendors. His most profitable dealings, however, were with sailors, of whom he purchased, usually for a mere trifle, any curiosities they

had brought from foreign lands, or any description of smuggled goods which they could contrive to bring on shore without awakening the suspicions of the Custom House officers; and of whom he also purchased prize money, at an unconscionable discount. He likewise fitted them out for sea, and cashed their advance notes at an enormous profit, and otherwise plundered them, as his successors, the land sharks, to be found in every seaport, do to the present day.

The day after Jemmy Tapley's conversation with the Widow Bolitho, at the Fisherman's Arms, the old seaman set out for Falmouth.

It was no uncommon thing on the part of the old man to wander away from the village of St. David and be absent for days and weeks, during which he was visiting his old shipmates in Falmouth and other smaller seaports in the vicinity, being always sure of a hearty welcome wherever he chose to put up—many people, in fact, eagerly proffering their hospitality in exchange for his "sea yarns," of which he possessed an abundant store, and in the relation of which he was apt to stretch the long bow to its utmost tension.

Usually on these occasions—since Mary Talbot had been residing at St. David—the old man had made it a practice to call at the young lady's lodgings and inquire whether she had any commands for Falmouth. He called on the present occasion; but instead of merely putting his usual question, he requested an interview with Miss Talbot. Mary was attached to the old man, and the interview was readily granted. When, however, he entered the parlour, he seemed somewhat at a loss to explain his object in calling; and it was not until he had blundered considerably that Mary was able to understand that he wished her to entrust him with the keepsake which had been given to her by her brother.

Through the story set afloat by Dame Hoolit, it had become generally suspected throughout the village that Mary Talbot had in her possession the locket lost by Mr. Aston, and many and various were the surmises as to the manner in which she became possessed of it. The general suspicion now pointed to Henry Talbot, and it was supposed that the reason Mr. Aston was so silent on the subject, was because Henry—still believed to have been lost at sea—was his nephew. It was a sore thought with Mary, who could not but be aware that these suspicions were abroad, and who longed for the day when, as she still believed, her brother's innocence would be made manifest.

The young lady was both surprised and abashed at the old seaman's strange request. She hesitated for some moments to comply with it, and it was not until Tapley had explained his reasons for the request he made, and assured her that he had cause to believe that, if she would entrust him with the locket, he could not only prove her brother's innocence beyond a doubt, but also would be able to show who was the actual thief, that she produced it from her writing-desk and handed it to the old man, with strict injunctions that he should take care of it, and not let it pass out of his possession, and should faithfully restore it to her on his return.

She was anxious to know more; but the old seaman was guarded in his speech. He hoped and believed that he had found a clue to the thief. This much he assured her; but he added—

"Aw may be mistaken, Miss, and aw wudna like to say a' aw think till aw'm right sure. Any way, aw'll bring tha' back t' jimerack to-morrow e'en."

So, with the locket in his possession, and a stout cudgel in his hand, Jemmy Tapley set forth on his journey.

It is very probable that the old man had had frequent dealings with Mr. Jakes in former days. At all events he knew the dealer well, and was well known to him, as indeed he was to almost everybody in Falmouth, or in any of the towns and villages within a radius of twenty miles around St. David.

On his arrival at Falmouth, instead of going, as usual, to the quay to see his numerous seafaring friends, he "bore up" for Caleb Jakes's shop—not the newly established jeweller's shop, but the old pawnbroker's and general curiosity shop, in the by-street above alluded to, and after having exchanged greetings with the proprietor, he carelessly inquired what news was stirring in the town.

"Well. Nothing to speak of, Jemmy," replied Caleb.

"Anything new at St. David?"

"Nought to speak on nuther, Muster Jakes," returned the old sailor. "In coorse," he went on, "thu's heerd as Tummas Dickson be a goin' to sot up i' th' public line, here at Falmouth?"

"Ay, Dickson told me as much himself, months ago. He did say that he was going to marry the widow Bolitho. Is that so, Jemmy?"

"Her wouldn't ha' un," replied the old seaman. "T' widdy's nean sich a fule. What for did un tell'ee he weer goin' to marry she, Muster Jakes?"

"Oh, merely in course o' conversation, Jemmy. He called to select some jewellery, and happened to say that he'd need a wife if he went into business, and then he spoke of the widow Bolitho."

"Her wouldn't ha' un if he weer made o' goold, aw tell'ee," repeated the old seaman. "Times be changed, aw reckon, when sich as Tummas Dickson have money to spend i' sich-like jimeracks."

"He has had a legacy left him, I've heard. But however, he didn't pay money for the jewellery he purchased. He exchanged an old-fashioned locket for the things he picked out, and I gave him a pound into the bargain. The locket, he said, had belonged to his wife—Sally Baker as was."

"Wheer did Sally Baker get howd o' a goold locket?" inquired the old sailor. "Her weer poor enow when her marri'd him, and so weer a' her folks."

"'Twas given her by a lady she lived with before she married—so Dickson said."

"When did Tummas tell'ee that?" inquired the old seaman, whose countenance might have betrayed the deep interest with which he listened to Caleb, although he strove to speak in an unconcerned manner.

"Full six months ago—perhaps more. About the time when I first heard speak of the legacy. I think he then spoke of it himself for the first time."

"Has tha got th' locket i' the shop now?"

"No. It was sold by mistake. Dickson naterally didn't want it to be known as he'd sold it, it having been given to his wife as a sort of keepsake, and being an article as 'ud easily be reckernised. So I promised as I'd melt it up for old gold, and it was very good and heavy, though a queer, old-fashioned thing. But the next day I picked out some goods I had bought, and had had in pawn, to be sent up to my new shop in the High Street, and the boy took the locket along with the other goods, and, unbeknown to me, hung it in the window. In the afternoon a young gent, who'd just got down from the stage, at the coach office just above, saw the portrait in the locket, and took a fancy to it. He came in, and on examining it closely said he believed the locket had once belonged to his grandmother, and offered me at once all that I asked for it, and bought a gold chain besides. I couldn't well refuse such a chance,

so I sold the locket; but Dickson believes to this day that it was thrown into the melting-pot."

While Caleb was speaking, Jemmy Tapley had taken from his pocket a small parcel folded in tissue-paper.

"What! Have *you* something to sell, Jemmy?" inquired the jeweller with some surprise.

The old sailor made no immediate reply. He unfolded the parcel, and to Caleb's utter amazement drew forth a locket and chain, saying, as he held the former up to view—

"Be this th' locket, Muster Jakes, as Tummas Dickson guv'ee for t' jimcracks?"

Caleb Jakes had more than once been in trouble in consequence of stolen goods having been found in his possession, and he knew that Tapley was aware that such had been the case. He had, however, purchased the locket in good faith, fully believing Thomas Dickson's story. After a few moments' hesitation, therefore, though he appeared blank with astonishment, he acknowledged that the trinket in the old seaman's possession was the veritable article which he had obtained from Dickson.

A brief earnest conversation ensued between the jeweller and the old man, the latter having retreated with Caleb to the dark recesses in the rear of the shop.

At its close the jeweller faithfully promised to keep silent respecting what had passed between himself and the old seaman, until the latter should call upon him to disclose the secret; and Jemmy Tapley having succeeded in his object to his perfect satisfaction, and in fact beyond his hopes and expectations, bade Mr. Jakes good bye, and went off to visit some of his old shipmates who resided in the town.

The next day he returned to St. David, and called at Miss Talbot's lodgings immediately after his arrival. To Mary he related the conversation which had taken place between himself and Caleb Jakes; but it was not without great difficulty that he prevailed upon the young lady to keep the matter secret for the present.

It was, however, Jemmy Tapley's wish that the secret should not be disclosed until he had woven the toils still more closely around the villain who had brought suspicion upon so many innocent persons, and caused so much pain and misery. The old man suspected Dickson to be guilty of other and equally atrocious misdeeds, which he wished to prove against him; and Mary, though she was eager for the moment when the mystery which had so long surrounded the robbery should be completely unveiled, and her brother's innocence perfectly proved, was too grateful to the old sailor for the interest he had manifested, and the pains he had taken in her and her brother's behalf, to interfere with his plans.

For some time past Miss Talbot had been very uneasy, in consequence of the strange silence of Sir Arthur Lockyer. Painful doubts had arisen in her mind, which she was unable to drive away, notwithstanding her innate consciousness of her brother's integrity; for she felt confident that wheresoever the young baronet might be, he must long ere now have received her letter.

The details she now learnt from Jemmy Tapley reassured her; but the time was drawing near when Henry and his cousins might be expected to arrive in England, and she was exceedingly anxious that the mystery of the robbery should be cleared up previous to her brother's arrival.

It was, however, necessary for her, yet awhile longer to exercise the virtues of patience and self-denial.

CHAPTER XLIII.—MESSRS. FOLEY AND FERRET IN THE STUDY AT MORTON HALL.

It will be recollected that some chapters back Mr. Foley was left in no enviable frame of mind, after he had perused the letter written by Mr. Ferret from the hotel in Falmouth.

The squire fretted and fumed and stormed, and at first professed to disbelieve all that the lawyer had written. He bewailed the death of his former solicitor, who, he averred, would have stood by him staunchly, instead of taking part, as he accused Mr. Ferret of doing, with those who had arranged a conspiracy to defraud him of his property.

Even when Mr. Ferret returned to the Hall, the squire charged him with complicity with his enemies, and heaped a torrent of abuse upon him, to which the lawyer listened in silence and patience.

At length Mr. Foley's mood changed. He began to bemoan his misfortunes; to speak of the ruin that was impending over himself and his family, and to complain that as soon as adversity threatened him, he found himself deserted by those whom he had believed to be his best friends.

Then Mr. Ferret spoke—

"My dear sir," he said, "if I could see any reasonable hope that you could successfully contest the claims of Mr. Henry—of this gentleman, I should say—who professes to be, and who, in my opinion is, beyond doubt, the youngest son of the late Edward Morton, senior, and consequently the legitimate heir to his father's estates, I should advise you to contest to the utmost the claim which I feel assured will, sooner or later, and, I have reason to believe very soon, be brought forward, and would myself use every exertion in your behalf.

"I, however, perceive no such hope, and therefore I should advise you as a friend, to adopt the plan I suggested in my letter; a plan which I have no doubt will redound to your advantage.

"Permit me to repeat certain of the facts mentioned in my letter, that you may understand them more clearly.

"I have ascertained that the mysterious stranger who some months since visited Fordham under the assumed name of Aston, and who is now residing at St. David, is, beyond a shadow of a doubt, the son of the late Edward Morton, supposed to have been lost at sea forty years ago.

"It is now known in the village of St. David that his true name is Morton. He has made himself known to Miss Talbot, the daughter of his deceased sister, who is also a resident in the village; and his banker in London, the postmaster at Falmouth, and other persons can prove his identity. Moreover, I have discovered, since my return to Fordham, that he was recognised, on the occasion of his visit, by old Matthew Budge, the sexton. The old man was cunning enough to conceal this fact from you; but, from something which the landlord of the Wheatsheaf let drop, I was induced to visit the old sexton, who could not evade my cross-questioning. I wormed the secret out of him in spite of himself. There is no doubt whatever, if the matter be brought to the issue of a trial, that scores of witnesses could be found to prove this gentleman's identity—persons who knew him in his boyhood. It would not be left to old Matthew alone. It is not as if a generation or more had passed away, and a son or grandson of the supposed lost Henry Morton were to appear and prefer his claim to the estates, in which case he would have to prove his descent by lawful wedlock, and there would be other chances in your favour.

"In the present instance the direct heir, a man of wealth, possessing the means to prosecute his claims, will appear *in propria persona*, still far from being an old man—in fact, by many years a younger man than you—able to give the history of his career from the moment he left England until his return. The testimony in his favour would be perfectly overwhelming.

"Why he has held himself aloof so long I cannot say; but to me the very fact seems indicative of some settled purpose; especially when I couple it with his secret visit to Fordham, so soon after his arrival.

"Now, by pursuing the course I advise, you would not only compel Mr. Henry Morton, whatever may be his feelings towards you, to deal generously with you, but you would also enlist the sympathies of the public in your favour——"

Here Mr. Foley interrupted the lawyer by speaking of the anonymous letter he had received, and expressing his opinion that the writer might be in possession of documents which might overthrow the claims of Mr. Aston, or the *soi-disant* Henry Morton.

Mr. Ferret, however, ridiculed this idea.

"I have," he said, "as I wrote you by letter, discovered who this fellow is. He is a mere mean scoundrel, who has robbed and would betray his master. He may possess some document which he, in his ignorance, believes to be of value, but which, be it what it may, can be of no avail against the claim of Henry Morton, openly and boldly set forth.

"I purpose, in fact, to serve you through this man's villainy. It will be necessary for you to show by what means you have become aware of the existence and the return to England of the direct heir to the property you have for so many years honestly believed to be your own. I suggest, therefore, that I return to Cornwall and seek an interview with Mr. Morton, when I will explain that, through the receipt of an anonymous letter—which I will, if you please, place in his hands—you came to the knowledge of his existence and his arrival in England, and that, assured of the justice of his claims, you have lost no time, since the receipt of the letter, in communicating with him through me."

The conversation was long continued. Mr. Ferret used every argument he could think of to induce the squire to listen to reason; and finally, though sorely against his will, Mr. Foley acceded to the lawyer's suggestions, and Mr. Ferret was left to act in the matter as he thought most advisable.

SOME HABITS AND CUSTOMS OF THE WORKING CLASSES.

UNDER the above quaint title a book was published last year, and I have it now before me. The question having frequently been debated whether the actual writer was what he professed himself to be, a working man or not, it may be worth while to state that quite recently I had the pleasure of an introduction to the author, who is a real *bonâ fide* working man, in the ordinary acceptation of the words.

Much talk there is about all being working men in our times, some by hand, and others by head. Thus Lord Brougham, in a famous address to working men, claimed to be as hard a worker as any of them; but in the plain use of the term, the working man is, he who, following some handicraft, wins his bread by the labour of his hands.

Even yet a limitation has to be imposed if we would understand by the working man, and in the aggregate

"the working classes," exactly what a journeyman engineer understands, and vividly represents in the interesting book now before me. He means a man who has learned some handicraft by apprenticeship, not a mere hod-man or carrier, or other unskilled labourer. This sort of working man has an importance in every industrial community, evident to all who reflect on the position in which he stands to the industrial arts. Money, mere capital, would make sorry ducks and drakes with the operation of any industrial art, but for the skilled workmen who operate. The working man, in this limited sense, is a very important individual; and being so, let us proceed to see what sort of a picture of him is drawn by the journeyman engineer.

"The typical working man," he writes, "has been done times innumerable by more or less eminent hands, and from very various points of view. Many of these word pictures of the working man, are, as word pictures, masterpieces, and are, considering that they are written by men outside of the classes of which they treat, surprisingly accurate; but still, to a working man, even the best of them plainly shows a want of that knowledge of the minutæ of the inner life of the working classes, which can only be thoroughly known to members of those classes. While some of the pictures of the working man that have been given to the world have been as impartial and accurate as it was possible for them to be made from an outside point of view, others have, as was naturally to be expected, gone to either extreme. The working man of actual life," the journeyman engineer goes on to say, "is like most other human beings, a compound of good and evil; he has virtues, but he also has his faults and weaknesses. He will maintain a battle for what he conceives to be his rights, and never count the cost. He will stand by his friend in cloud as well as sunshine, and he will often endure the woes of want, and the still more terrible grief of seeing his wife and children suffering those woes, while he is powerless to relieve them, with a degree of fortitude which, were it displayed on a more public stage, would be deemed heroic. Take him for all in all," writes my authority, "the working man is not a bad fellow;" yet (and now you will see, my friend, that the journeyman engineer is no thick-and-thin eulogist), what follows next proves the typical working man to have much that is improvable. "In him," says my authority, "human nature has not attained the maximum of perfectibility just yet. His character has its seamy as well as bright side. He is often drunken, and not always ashamed thereof; and sometimes his love of drink leads to his being guilty of conduct which, to put it mildly, is not all that may become a man. Moreover, he frequently, in a too literal sense, takes no heed for the morrow. Though endowed with a considerable amount of natural shrewdness, he is constantly allowing himself to be cajoled out of money, and used as a tool by gangs of idle, ignorant harpies. He is not, generally speaking, so well educated and well informed as he might be. His language is scarcely pure English undefiled, and is too habitually full of strange oaths. His ideas upon history, political economy, and the constitution of society are noticeable rather for their confusion, and their exceedingly pronounced tone, than for their extent or accuracy." Well, this at least is not flattery, and it comes from "one of themselves."

Are the working classes as well educated as they might be? asks my authority, and presently answers, they are not. True, a large proportion can now read and write—and, thanks to cheap educational literature, there are not a few men among them who are, even in a scholarly sense, well educated; but the ignorance, the

want of anything like real or beneficial education that still prevails among them as a class, and which is seen most remarkably in those who have received all the benefits of the educational machinery at present applied to their benefit, is unpleasantly astonishing. Farther on, our author explains what, according to his view, is the cause of the working artisan's defective education. How comes it, he inquires, that, educational and general literature being so cheap and abundant, educational facilities so wide-spread and easy of access, and artisans endowed with a considerable share of natural intelligence, they should, as a class, be ignorant and ill-informed? The answer is, that the system of education applied to the working classes is a thoroughly unsound one. It attempts too much—attempts to make scholars of children, instead of merely trying to pave the way to their becoming intelligent men. It is a sort of Jack-of-all-trades and master-of-none system, touching in a dry and elementary manner upon a great many branches of education, without going far enough into any one of them to make it sufficiently interesting to the pupils that they should pursue it for the sake of the pleasure it gives after they have left school. In his further remarks on the education of the working classes, our author lays great stress on what, since his book was written, has grown into one of the leading questions of the day, viz., technical instruction. That he is not unmindful of the spiritual interests of his dawning pupil mind, will be gathered from the following. "I leave it to be taken for granted," states he, "that a knowledge of the Scriptures would form part of this, or any other system of English education; but a much higher knowledge of them would be conveyed to the pupil if, instead of setting him to learn chapters of the Bible by way of punishment, or cramming him with genealogies of the Patriarchs and Apostles, just previous to examinations, he was shown the geographical positions of the various countries mentioned in Holy Writ, and told the changes they have undergone, and their present social position among the nations of the earth, and had pointed out to him the glorious poetry and wisdom of such parts as the Psalms, the Proverbs, and Christ's parables and sermon on the mount, and the applicability of many of the lessons contained in them to the affairs of everyday life at the present time."

I pass over the several chapters "On Working Men's Friends"; "A prosperous Trade Union"; "Trades' Societies and Strikes," etc., to arrive at "The Inner Life of Workshops." In all phases of life our author fancies, and he is right, there is a sort of inner life—a life behind the scenes—and only known to the initiated. The working man, who should enter a workshop with no other end than work in view, would, according to our journeyman engineer, soon find the workshop too hot for him—so hot that, as a rule, he would have to leave it, and might thank his planets if he was fortunate enough to escape personal violence. When an apprentice enters a shop, his first education is learning how to "keep nix." What keeping nix means we shall learn presently. "Keeping nix" is really an important job. If the apprentice do it well he is raised in the estimation of those who are to bring him up in the way he should go. It consists in watching for the approach of managers or foremen, so that prompt and timely notice may be given to skulkers, to reading or smoking individuals—to men engaged in "corporation work," to wit, work of their own done in time paid for by the master. The boy who can "keep nix" well—who can detect the approach of those in authority while they are yet afar off, and give warning to those over whose safety he has been watching, without

betraying any agitation, or making any movement that might excite the suspicion of the enemy, will win the respect of all his mates—will be regarded by them as a treasure—a youth of promise. But should he be so slow or so unfortunate as to allow his mates to be "dropped on" while he is upon guard, then woe to him. Curses loud and deep will be heaped upon his thick head; a stout stick and his back will probably be made acquainted; and from that time forth, until he has redeemed his tarnished reputation by doing something specially meritorious in the nix-keeping way, he will be regarded as one concerning whose capacity to learn his trade there are grave doubts.

Another accomplishment which the apprentice is expected to learn, is that of smuggling drink into the shop in a bold and scientific manner. Drunkenness, however, the journeyman engineer testifies, has been giving way to moderation in workshops for many years past; hence the apprentice smuggler's art is less esteemed than formerly. There are now many working-men, writes my authority, who are not only guiltless of drunkenness and liquor smuggling, but so totally opposed to their being practised by others, that they would if they could save the apprentices from their demoralisation. Very demoralising it is, for not only does a boy run the risk of being disgraced and punished if he is detected in bringing in the drink, but the "sups" with which he is rewarded on these occasions often lay the foundation of drunken habits. Nominally a boy might refuse to be a surreptitious liquor carrier, but virtually compulsion is laid upon him. He cannot afford to deny a favour to a man upon whose good will depends the question whether he be a good or a bad workman. Nominally it is to the master that a boy is bound, yet it is on the goodwill of the skilled workman of the establishment that he really has to depend for initiation into those little "wrinkles" and specialities, the knowledge of which makes the difference between the bad or only ordinary workman.

Nor must the apprentice, however desirous of mastering the technicalities of his calling, dream of quietly devoting himself to the pursuit of that kind of knowledge until he has undergone a further initiation into the nature of workshop life by having a number of stock tricks played off upon him by the older apprentices. These tricks vary, as described by my authority; they comprehend a mixture of rough practical jokes, with some little fine metal of wit and refinement. The new apprentice will be, perhaps, sent to the most ill-tempered man in the shop for the loan of a round square, or to address him by some offensive nick-name. His reception by the ill-tempered man will be both astonishing and disagreeable. The older apprentices will express contrition, and as a makepeace will volunteer to instruct the tyro in the use of his tools. When they have got him fairly to work they will jerk the elbow of his hammer arm, thus causing him to hit his chisel hand. He probably knocks a piece of skin off, when, making a wry face and wringing his hands, he is informed that the hammer could not have hurt him much, *because* it was not upon his hand a minute. At length, the gauntlet having been run, the young apprentice will settle down unmolested to learn the use of the simpler tools. The next two or three years go on more smoothly. The apprentice grows into the workman, and, as a rule, getting disenchanted as he becomes familiar with the intricacies of the trade. The persecution exercised by some workmen over apprentices is, according to the journeyman engineer, so exacerbating, that many boys of spirit vow to have revenge so soon as their indentures are out. These vows are rarely fulfilled; but my autho-

rity knew one occasion when a threat of this sort was carried out. "I once," he writes, "did see a young man fulfil a vow of this kind. As soon as the clock struck twelve on the day on which his indentures expired, he threw down his tools and immediately pitched into a workman who had habitually ill-used him during the first three years of apprenticeship. Having given the man a sound thrashing, he deigned to explain his reasons for so doing thus:—'I always told you, when you used to knock me about when I first came to the trade, that I would pay you off for it when out of my time, and now, if I send any one to you for my character you can say that I kept my word.'"

With this outline of apprentice life in an engineer's workshop I shall conclude the sketch of a very interesting book, which up to a certain point we have thus analysed. The chapters on Saint Monday, Teetotalism, Penny Readings, Working Men's Saturdays and Sundays, touch upon matters of great interest indeed, but open to more discussion, and which have been more fully talked and written about than the matters which constitute the first half of the journeyman engineer's very thoughtful and well executed and every way interesting volume.

TWO MONTHS IN SPAIN.

IV.—SEVILLE.

THE distance from Cordova to Seville by rail is about seventy miles, through the valley of the Guadalquivir; and here we first began to see the semi-tropical character of the country, with increased vegetation. Extensive fields of olives stretch up the face of the low range of hills on each side of the valley, with gardens and orchards of orange and lemon trees, bordered with the cactus and aloe. The weather still continued delightful, and the air clear and buoyant, and just sufficiently cool to be agreeable. This was one of the most pleasurable of the many pleasant days I spent in Spain. My only companion in the carriage was a Spanish gentleman of an old Seville family of some note, who was himself born in one of the Spanish South American colonies. It is not always easy to get information in Spain. The consuls and attachés are proverbially close, and the Anglo-Spanish merchants are afraid to commit themselves by too free an expression of opinions. I had on several occasions the advantage of meeting with well-educated and travelled Spaniards, whose opinions I considered of more value than those of foreigners, who are liable to see things through the prejudices of their own country. My companion was one of the best type of the Spanish gentleman, with all the *suaviter in modo* of the old Don, and the frank intelligence of the English and American gentleman. He brought some pomegranates and melons into the carriage with him; and as no Spaniard partakes of anything without asking his neighbours to share with him, this brought about an introduction; and when he heard that I was familiar with these fruits, and had seen something of the world, he was at once frank, friendly, and communicative. I learned that he had travelled as a student of botany and natural history, and was an author, as I afterwards heard, of no mean repute. He told me of his travels in India, from Ceylon to the Himalayas, and spoke with true-hearted affection and gratitude of the kindness and friendship he had received from Lord Auckland and the Honourable Misses Eden, and the disinterested hospitality of the officials and "merchant princes of India." He was a great enemy to slavery in every form; and this led to some reference

to the career of the late Marshal O'Donnell in Cuba. "The general," he said, "was not a friend to England, or any of its plans, and retained much of the old Milesian hatred of the Saxon race. Nor for that matter was he any great friend to Spain. It was reported that he brought more money home from Cuba than the whole of his salary and allowance would have amounted to while there, and left a large and questionable fortune, in which Spain has no interest. I grieve very much," said my companion, "that this country, which I claim by blood and religion, should be governed by men of this class, and for their interest; but no others have a chance under our present system. The great body of the people have been so cowed and kept down by the combined efforts of Church and State, that no sentiment of true liberty is allowed to approach them. I often tell my countrymen who have never been out of Spain, that they make a great mistake in fancying that they can keep either the religion or the morals of the nation more pure by excluding all light from without, and locking up their religion, as it were, in a dark chamber. My own opinion of Catholicism is, that the more it comes in contact with light, and rubs shoulders with the intelligent labours and opinions of other bodies of Christians, the more bright and beautiful will it appear; and if this doctrine had been earlier understood by the Church, there would have been no need of an exaggerated reformation." This is a view of the case on which we might have differed, but we had no time to discuss the question further. My new friend's kindness followed me to my hotel. He gave me an introduction to the landlord of the Fonda de Europa, where I got the best room in the hotel, with board and attendance for thirty-five reals a day, and had more comfort and attention than some of my travelling acquaintances had for double this sum at the more fashionable Fonda de Madrid, Hôtel de Paris, and Hôtel de Londres. But to return to our journey.

The fine land between these two cities seems poorly cultivated, and at long intervals you see a half savage shepherd tending a flock of rough-looking sheep, reminding one somewhat of the Campagna at Rome, where there seems scarcely a blade of grass for the cattle to feed upon. There is neither labour nor manure bestowed on the land; and the small wooden plough, drawn by four oxen, is as primitive as that of Egypt or Hindustan. As you approach Seville the scene begins to improve, and the large orange and lemon gardens, laden at this season with their golden fruits, give a novelty and charm to the landscape. On arriving at the station, outside the town, one would think he had come on a colony of Irish. A crowd of half beggars and half idlers thronged around, with the same distinct characteristics: not a coat or covering alike, felt hats in every stage of decay, and ragged coats of many colours; the same wide mouth, thin lips, deep careworn lines on the face, low forehead and sharp eyes, half mendicant and half defiant. Here I found the same mendicant system prevailing as in Bohemia, South Italy, and in the South of Ireland. Is this the result of races, or may it be the peculiar training of their "friends, philosophers, and guides?" But this I must leave for moralists and physiologists to decide—it is altogether beyond my comprehension.

An English poet speaks of Seville as

"A city famous for oranges and women;
He who has not seen it will be much to pity;
So says the proverb," etc.

If he meant the beauty of the women, I think he took a poetical licence, or borrowed from some of their own poets. I did not see anything approaching to our idea

of handsome features. The young women of the higher class are mostly round-faced and plump, with a profusion of dark hair, and large black eyes, which they use under their fans with wonderful effect; but their features are very common-place, and have not a single classical line of beauty about them. The men of the same class have fine heads, and carry themselves with great dignity.

With regard to the "oranges," there is no mistake whatever. The whole city is a garden. My window overlooked a patio or courtyard, with orange, citron, and banana trees in full fruit, and in the centre a marble fountain, the music of its limpid jets giving life to the quiet beauties of nature; and it was hard to sit within doors with such a scene before one.

There is no place in Europe—I had almost said in the world—in which a British traveller finds himself so far from home as in Spain. If you go to the cities and prairies of America, or to the Delta, or the source of the Ganges, you know pretty well what you have to expect, and are less surprised; but here, a few days' journey from London and Paris, you feel that you are thousands of miles from home, and everything around you a mystery and a paradox. The old Moorish houses, with their courtyards and gardens, seem to throw you back in contemplation a thousand years. Many of the residences of the gentry and grandees are in narrow streets, little better than footpaths, but with all the appearance of oriental luxury and splendour. The patio is paved with slabs of white and black marble, divided from the outer to the inner court by light and elegant iron gates, gilt and ornamented, and round the centre is a profusion of fruit trees and flowers of every hue. I will not say much of their internal comforts; they may be adapted to semi-oriental people, but are perfectly unsuited to our ideas of comfort. As I have said before, the people live much out of doors, and their alamedas, or public walks, with avenues of orange, lemon, and acacia trees, with seats

"For aged sires and whispering lovers made,"

under their green and golden canopy, are to travellers a never-ending source of pleasure and surprise.

The "lions" of Seville occupy but a few days; and perhaps this was the best season of the year to see them with comfort; the air was so light, clear, and bracing that one never tired of walking about. The Cathedral is the first object of interest and attraction. It is built on the site of the great Mosque, and all that remains now of the Moorish architecture is a part of the walls, the great entrance gate, the fountain and court of orange trees, and the celebrated Giralda, so well-known to all artists, and acknowledged to be the finest specimen of the Moslem towers now existing in Spain. There are some curious legends about this tower, and of two mysterious ladies who by some supernatural power supported it in a storm or earthquake, and these sisters still hold a prominent place in the arts and ceremonies of this city; but these legends are so absurd and childish, that it seems almost contemptible to refer to them. This beautiful tower requires no such puerile support: it is still "a thing of beauty," and forms the finest and most prominent object in the general view of Seville. That part which belongs to the original Moslem tower, of 250 feet, only reached to the present belfry. The upper portion is of Christian construction, and is not in keeping with the chaste, massive architecture of the Moors. Surmounting the whole, at a height of 350 feet, is the figure of Faith, performing the part of a vane or weathercock, the origin of many jokes and sarcasms on the movings and twistings of the Church.

One of the curiosities shown here by the guides is the

clock, the work of a monk, and the first put up in Seville; but that is all that can be said for it, as it presents no dial to public view. In fact, strange to say, you may walk for a whole day through Seville and not see a clock. The sun is their timepiece, and their matins, mid-day siesta, and evening meal, mark all the time they care about. The ascent of the tower is by an easy incline paved with bricks, similar to that of the Campanile of Venice, which may be ascended on horseback—a feat performed by "Nuestra Senora" on her visit to this city. From the bell-tower, a height of 350 feet, a fine view is obtained of the city and windings of the river, and a complete panorama of all the objects of interest around.

The appearance of the cathedral from the outside seems a great mass of confusion. You have the Moorish tower and walls, and at another angle a plain Doric building, called the "parish church," as if the church of St. Margaret's, of Westminster, was stuck on to our Abbey, at right angles with the western porch. This incongruity hides the main building, and we must enter in order to see its magnitude and beauty. The building is in the style and period of our Westminster Abbey, when, at the middle of the fifteenth century, the lofty spear arches, oriel windows, and groined arched roof, had attained their purest and highest perfection. It stands on a larger space than our Abbey, and instead of the long aisle or nave, the four sides of the cross form nearly a square, with the choir and high altar in the centre of the transept. No description of mine can give any adequate idea of the amount of art and labour displayed in this transept. The wood carving in the choir and round the great organ seems like the work of Titans; and over the high altar rise tiers of ornamented gilt columns, graven images, silver candlesticks, and jewelled virgins, till the maze of gilt and ornament is almost lost amidst the lofty arches. There are nearly one hundred priests connected with the cathedral alone, who perform from sixty to eighty masses a day—whatever this may mean—for I never saw any one but the officiating priests take any interest in them. There are some forty or fifty chapels round the building, each under the patronage of some holy saint or special virgin, and all contain elaborate ornament and jewelled images. As I stood opposite a wooden image of the Virgin, at one of these altars, the guide explained to me that the diamond necklace round the neck of the image was presented by the Infanta, Duchess of Montpensier, and was worth £20,000; that the bracelets and other jewels on the image were altogether worth £60,000.

In that portion of the building called the Sacristia Mayor, are contained the treasures of the church. The term Custodio is synonymous with Tabernacle, containing the "holy of holies," and is generally of silver and silver gilt, of the most beautiful workmanship, on which the Cellinis of Spain have been employed, and have produced most exquisite works of art. This Sacristia is said to contain the value of half a million sterling. My guide, notwithstanding his liberal opinions, was proud of the wealth of the cathedral—"Great is Diana of the Ephesians"—and would insist on my going in to see this treasure of the Custodio; and I indulged him with a franc to open the door. This is the great show-shop of the cathedral, and "worth half a million sterling," more or less—perhaps less; but there is a large quantity of diamonds, rubies, and pearls set in crowns and ornaments, and embroidered on sacerdotal robes, with cups and candlesticks, etc., in massive silver. It is curious and inconsistent that a church which holds the Jews in such contempt, and has banished them from this very

Catholic country, and appropriated their synagogues for Roman worship, should have grafted so much Judaism on the simple and sublime doctrines of the New Testament. There are some fine Murillos and other paintings in the cathedral, but they are entirely lost in bad lights.

old Moorish palace. Perhaps I should have seen the Alhambra before visiting this, as there is a difference of opinion which of the two is the most interesting. This palace has been carefully restored, and is in excellent order, and was the residence of the Duke de Montpensier

THE GIRALDA.

"These were painted for the church, and not for the public," as a priest told me. There are some forty or fifty other churches, but they have much the appearance of those half-finished churches we see in Italy; as if the funds had not kept pace with their religious fervour. I visited a number of these churches, to see some celebrated pictures of Murillo and other Spanish masters, but I found them, as in the cathedral, completely lost in the dark recesses of the altars.

The next object in the list of visits is the Alcazar—the

and the Infanta Maria Louisa, after the "unfortunate Spanish marriages," which brought so much shame on the Orleans family. Their first daughter, lately married to her cousin, the Count de Paris, was born in this palace in 1848. The charm of this, and all these Moorish buildings is, that you are looking on objects little changed for a thousand years, the works of an ingenious and poetical people, in which you can read the history of a nation that has disappeared from this busy western world. Perhaps the garden is the great attraction here. It

contains all the beauty of the Moorish with the Espano-Flemish gardening of the seventeenth century. Here for the first time I saw the orange trees trimmed into walls and hedges of twenty feet high, with the golden fruit just peeping out through the green foliage; and here, growing side by side, are borders of box and myrtle, the palmetto and apple, the pomegranate and the plum—the beautiful ponsetia, or red-leaved plant, and the rich

Downie, a child of the Scottish parochial system, who from a young clerk in the commissariat, rose to be the honoured friend of the Duke, and the Alcaide or governor of the Alcazar. In the Armoury at Madrid we were shown the sword of Pizarro, which had been presented by the Spanish Government to Sir John Downie, for valour in the field. With some English soldiers, after his Estramadura legions had deserted him, he charged

GOLDEN TOWER, SEVILLE.

flowering geranium—in short, the Tropics and temperate zones vying with each other which should yield to man the greatest amount of beauty to the eye and joy to the senses, with Moorish kiosks and summer-house to rest in and view the charming scene. There are many of the gardens of the nobility that are worth visiting, but they are all of the same character. The palace belonging to and occupied by the Duke de Montpensier is not open to the public, but I had a look into his garden, which covers, I should think, fifteen acres, and I was told that the Duke got £1,000 last year for his oranges. Near to these gardens is the great tobacco manufactory, which has all the appearance of a strongly-fortified castle, with strong wall and deep ditch. The building within forms a quadrangle, each side about 600 feet. There are upwards of 4,000 women employed here in the manufacturing of the commonest cigars. This does not seem to be an unhealthy occupation, for many of the women are the healthiest and best-looking in Seville.

Crossing by a line of planks the Guadalquivir, which is here about the breadth of the Thames between Kew and Putney, but after heavy rains rises to a dangerous extent, doing great damage to property on its banks, we paid a visit to the pottery and porcelain works of the kind and hospitable Mr. Pickman. These are inferior to many of our Staffordshire works, and would have no chance in competition with them but for the almost prohibitory duty on foreign imports. I was reminded, when crossing this temporary bridge, of the daring and bravery of my countryman Sir John

across the bridge to capture some guns that the French had planted on the opposite side. He had got half way across when a portion of the bridge was blown up. He leaped his horse over the gap and charged alone, his men being stopped by the explosion. At the same moment a grape-shot struck him and carried away a part of his cheek, and a second shot hit him in the left arm. Finding himself severely wounded, he wheeled his horse round and made for the gap, and hurled the sword of Pizarro back into the ranks of his own men, and was then taken a prisoner. I transcribe this episode of the Peninsular war from a letter now in my possession from a near relative of the late Sir John Downie.

The right bank of the river is connected with the city on the left, by a fine suspension bridge, which was constructed some years ago by an English contractor. From this bridge a fine broad Prado and avenues of trees skirt the banks of the river. Not far off is the celebrated Golden Tower. It is an octagon building of four storeys, partly of Roman and Arabic construction, in fair preservation. It is said to have taken its present name from the first gold brought from the New World being deposited there; but this tradition is very doubtful. The Sevillians have lately raised a statue to their great townsman Murillo, and called the plaza after him. And here is their museo or picture gallery—a very small affair indeed—which, but for the few great pictures of Murillo, and wonderful life-like statuary in wood by the monk artist and man-of-letters Cano, would scarcely claim a visit.

Among the curiosities of Seville is a Moorish building called Casa de Pilatos, or house of Pilate. The guides have a number of absurd stories about this house; but the simple fact is that it is not an ancient Moorish building appropriated by the Christians, but was built by a Spanish nobleman in 1500, on his return from a pilgrimage to Jerusalem. All the beauty and ornament of the Moorish architecture are well and closely imitated, but it is about as like the house of Pontius Pilate as it may be to that of the Temple of Jerusalem! It is, however, made a great thing of during Passion week, when the processions start from it for Calvary—a scene, as described to me, very much resembling the ceremony of carrying my old and venerable acquaintance of other days, Durga, to the sacred Ganges.

One cannot visit so interesting a city as this, and entirely pass over these details, as they occupy much of our attention, and give one a key to the history of the place; but, when the "lions have been done," it is a pleasure and agreeable pastime to walk through the labyrinth of oriental-looking streets, or lounge in the orange and acacia groves of the beautiful alamedas and gardens, and watch the crowd of jolly priests in their black mantles and coal-scuttle hats. For a city of only 100,000 inhabitants, it is amazing the number of idle citizens that are abroad "worshipping the rising sun," and hoping that something will turn up to-morrow to their advantage. You see no anxious faces "running to catch the first train;" no bustling and hustling each other, trying who shall be first at the office or the mart. "Why hurry? there is plenty of time to-morrow."

Notwithstanding, I like the Spaniards very much; they are kind and obliging people, and look for a return of the same feeling. They have a proverb that says, "Courtesy costs little, and is of great value;" and I am glad to say that I got on very well among them. No doubt one unacquainted with their language will be subject here, as in other countries, to some annoyance and imposition; and, if you will excuse a little egotism, I will let you into the secret of my success among them. Age and some experience have taught me that it is better to make trifling sacrifices than to disturb one's equanimity. I have seen a club-swell in London haggling with a cabman about a sixpenny fare, and probably going in for an eightpenny Havannah and a bottle of champagne to dinner. This is all a matter of opinion or taste. I adopt a different principle—keep down my hotel bill, and submit to trifling extortions, or at least always give Cabby and other hardworking men the benefit of a doubt as to the exact charge. The disbursement of a few francs spent in this way rids one of many trifling annoyances, eases the mind, and makes things go pleasantly.

One little difficulty there is in Spain in the way of the stranger. When you think you have mastered a small vocabulary of useful words, the Andalusian ear is so finely tuned to sound, that unless you breathe the language in the softest accents they will not understand you. I was making some inquiry about "Jerez"—i.e., the Xerez of our Gazetteer. The "J" is sounded like "H," and I tried "Heres" in all its softest modifications, but I might as well have asked for "Timbuctoo." This reminds me of the sailor that said, "Them stupid foreigners calls everything by a wrong name. They calls a horse a shovel, and a house a mason, because they don't know any better." But let me now bid adieu to Seville, as I have an invitation to taste some fine old sherries at Jerez, which, I have no doubt, I shall find much easier to mouth than the Spanish consonants.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDZ.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

VI.—NEWSPAPER READINGS.

It was not until the light of the short winter's day was passing into the deepening gloom, and all snug preparations were made wherewith to "welcome peaceful evening in," that the Olney postman "dropp'd th' expected bag," in which was that wondrous "folio of four pages" which enabled the poet to peep at the world "through the loopholes of retreat," and, while sitting at ease, to survey "the globe and its concerns." In our railway age of progress we are not kept waiting so long as Cowper was for a sight of "th' important budget." In all large towns the local newspapers, with their telegraphic summary of the latest news, enable us, by eight o'clock in the morning, to skim the cream of the intelligence that will be offered to us in the London papers at a later hour of the day. This is undoubtedly a great advantage and convenience to that large class who, when breakfast is over, must attend to the numerous calls of their professions and business, and who may have no leisure to glance at the London papers until they are in Cowper's case—a case expressed by the familiar phrase suggestive of undisturbed retirement, "shut in for the evening." It is then that the peeps through loopholes may be taken with more ease and gain, the thoughts and attention not being "dispersed by daylight and its cares." Yet, not all of us, even when far from busy towns and ruralising in some sequestered village, are condemned to vegetate all through the day, without knowing what is going on in the outer world, and at a safe distance hearing the roar and seeing "the stir of the great Babel."

That great leveller, the railway, places county-town and country-hamlet on an equality, when dealing out its gifts and distributing its conveniences. "Remote, unfriended, solitary, slow," as my hamlet of Minima-Parva may appear to be, topographically and socially, yet it lies not far from the track of a railroad; and by "the nine-twenty" train, as we call it, from London, on each week-day morning, there is dropped a parcel at the small station, four miles from Minima-Parva, and some seventy miles from the great Babel, and from this parcel is conveyed to me, by messenger, a damp copy of that morning's "Times." Another copy is taken, in a similar way, to the Squire of Minima-Parva, who not unfrequently is put in possession of his morning's newspaper at an earlier hour at his country-house than he can obtain it when at his town-house. This is partly explained by the fact that all the earliest copies of the "Times," the publication of which begins at five in the morning, are despatched to the railway stations, to go off into the country by "the 6.30" and first trains. Thus, through the clever combinations of Printing House Square, the news agents, and the railway, we sequestered rustics of Minima-Parva are enabled, soon after ten o'clock each morning, to read all the news of the world, as it was known in London up to two or three o'clock that same morning—a common every-day event, but none the less a marvel.

At what point will the marvel stop? and at what dimensions? Some witty people, a few years ago, published an imaginary copy of the "Times" of the next century. It contained accounts of the voyages of aerial ships, the journeys by balloon-railways, the steam foot-

men who wanted places, the debates in the Ladies' Parliament, and all those other innovating improvements to which we are presumed to be hastening; and these prophetic witticisms were printed on a sheet nearly as large again as that to which the "Thunderer" has now developed. As though to make the contrast all the greater, there was issued at the same time a very careful reprint of the "Times" for October 3rd, 1798, of which reprint a description is given in the "Leisure Hour" for August 8th, 1863; and, in its dimensions, with reference to the modern broadsheet, it was as a baby is to a man. It was, indeed, almost a baby image; for the first "Times" was published on New Year's Day, 1788, since which date it has never failed in a single issue, although it has so increased in dimensions that we have even seen its double supplement itself supplemented by an extra supplement. But when it was first issued it was but a tiny sheet of curtly-conveyed items of news; a modest "folio of four pages." Not that those words of Cowper's referred to it; for they were published three years before the "Times" existed; like Mr. Puff's Spanish fleet, it was "not yet in sight." And now that it is in sight, it is a sight indeed. The paper alone on which it is printed is worth all the money charged for the news; and if you doubt its quality, ask any housemaid who has vainly endeavoured to light her fires with the "penny papers" instead of with the "Times." Its size may be judged from the fact, that one copy of the paper, with its full supplement, contains about 20,000 lines or 200,000 words, is equal to an octavo volume of 500 pages, as commonly printed, and could not be written out by the most rapid writing lawyer's clerk in a fortnight, at the rate of ten hours a day. And, with all this, it is printed with such marvellous accuracy, that misprints are as few and far between as plums in a workhouse pudding.

It is worthy of remark that the first copy of the "Times" was printed by a new system, thus expressed in the original title of the paper:—"The Times, or Daily Universal Register, printed logographically;" and the imprint ran thus:—"Printed for J. Walter, at the Logographic Press, Printing House Square," etc. When the second title of the paper was soon afterwards dropped, it was stated that "the 'Universal Register' has been a name as injurious to the logographic newspaper as Tristram was to Mr. Shandy's son." This clever invention of logography was due to Mr. Walter. Whole words were cast in type, and the speed with which a paragraph was set up in print was thereby greatly quickened. The invention, however, did not succeed, and had to be abandoned. The compositors complained that the logographic words could not always be made to fit in to the length of the lines; and, as they could not be divided, time was as often lost as gained. But the idea of the logographic printing is a good one, and, with certain modifications, ought to be made practically available for the printer's purposes. Mr. Greene, M.P. (for Kilkenny), endeavoured, in 1855, to reduce the system to practice; and Major Beniowski—favourably known for his mnemonic system—also applied himself to carry out the idea. It has been recently further developed under the direction of Mr. George Clark—known to the public in connection with the granulated wood gunpowder, and many other inventions in explosives and gunnery—and will, probably, be shortly introduced to the public under the title of the "Word Type," a far more manageable name than logography. Syllables are cast, and a word is thus easily put together, and as readily divided. The plan has already been so far advanced, that, in the last week of March, 1868, a printer set up in type in twenty-

three minutes, by means of the word type, an article that another printer was fifty minutes in setting up by the letter system. After an interval, therefore, of eighty years, it is possible that the "Times" may be printed by an improvement of that system, invented for its first publication in 1788 by its founder, Mr. J. Walter.

As with other things, so with the press, the supply has been created by the demand. Lamentably deficient as we still are, as a nation, in respect of education, yet the increase of knowledge, and, with it, the thirst for more knowledge, has been quickened during the present century to an extent that is really marvellous when compared with its slower growth in previous centuries. Unhappily, there are still millions of working-men who cannot read a line of print; yet, even among them, the newspaper is doing its civilising work, whether its penny sheet is spelled out to them by a better instructed neighbour or child in a remote English village or wild Highland glen. In these cases, indeed, the penny weekly local paper is the only one that is read; and I have known instances where its perusal has literally been spread over the six days of the week, the advertisements coming in for their due share of attention. If Hodge, the ploughman, is "no scholar," yet he is charmed to hear "a bit o' the noos-paper;" and although Donald, the West Highland shepherd, usually discourses in Gaelic, and makes a pretence that he "has got no English," yet even he is bound to be enthralled by the elegant extracts from the English press. More than one country clergyman, during the feverish and agonising excitement of the Crimean war, was wont to assemble his rustic population on two or three evenings a week in the village schoolroom, and there read to them the Times' report of the campaign, and of the doings and sufferings of our brave soldiers in the trenches before Sebastopol. And, whatever honour may have justly accrued to Dr. Russell, "the Pen of the War," for those Crimean letters (that may be said to have created a new feature in journalism), yet, among the millions of readers who hung upon his words and followed him through every sentence with throbbing heart and quickened pulse, I feel sure that there were none who felt a deeper interest in what he wrote than those unlettered agricultural labourers, who, night after night, forgot their daily toil and cares in listening, breathlessly, to the reading of his letters, and being borne by them, in imagination, to that scene of strife where "glory" and sorrow went hand in hand. And though Miss Nightingale can never know one thousandth part of the widespread good her humanising example has diffused, not through Britain only, but in every part of the world where the true force of a woman's gentleness is felt, yet even she might well have been proud of those "tributary tears" that trickled down the rustic cheeks when the story was read how "Santa Philomena," "the lady with the lamp," went her nightly rounds among those "miles of beds" on which lay the wounded and the dying. These were good examples of the success attendant upon "Newspaper Readings."

The popularity of "Penny Readings" appears to be on the increase, especially where Hamlet's soliloquy is followed by a lay of the negro minstrels, or a comic recitation. Too often these programmes display pitiful taste. At such entertainments our English classics are not unfrequently compelled to appear "cheek by jowl" with very incongruous companions; and if only a decent "interval of ten minutes" be allowed between the parts, the sacred can be forgotten in the secular, and the audience that yawned over Handel's gems in Part I., can be roused to an enthusiastic *encore* of a low music-hall song in Part II.

And, with regard to the great composer just mentioned, might not Cowper have written the following lines with the prescience of a "great Handel Festival?"

"Ten thousand sit
Patiently present at a sacred song,
Commemoration-mad; content to hear
(O wonderful effect of music's power!)
Messiah's eulogy for Handel's sake.
But less, methinks, than sacrilege might serve—
(For, was it less? What heathen would have dared
To strip Jove's statue of his oaken wreath,
And hang it up in honour of a man?)
Much less might serve, when all that we design
Is but to gratify an itching ear,
And give the day to a musician's praise.
Remember Handel? who that was not born
Deaf as the dead to harmony, forgets,
Or can, the more than Homer of his age?
Yes—we remember him; and, while we praise
A talent so divine, remember, too,
That His most holy book, from whom it came,
Was never meant, was never used before,
To buckram out the memory of a man."

The performance of Handel's Oratorio of "The Messiah" is to occupy the first day of the third great triennial Handel Festival, to be held at the Crystal Palace on Monday, June 15th, with a monster orchestra of four thousand performers. The manager of the Crystal Palace makes this preliminary remark on the contemplated performance of this Oratorio:—

"A grand performance of the 'Messiah,' by thousands of thoughtful and intelligent auditors, is looked upon as a lofty religious exercise of the mind, to be often indulged in, and to be treasured in recollection at all times and seasons." Whether this "religious exercise" can be best obtained in a building so replete with secular associations and amusements, is a question that might readily be answered; but, without replying to it in this place, let us quit the monster festival for the humbler penny readings of which we were speaking.

Granting their popularity, and also their usefulness when properly and judiciously conducted—(ay! there's the rub!)—why should not "newspaper readings" be occasionally attempted, in such places and in such cases as those to which I have referred? "To be or not to be" would only suggest somnolence to Miss Ann Taylor's "Contented Hodge, the Hedger and Ditcher;" and Burke's most famous oration would shoot over the heads of ploughman, shepherd, and drainer. But read to them such a newspaper article as the record of the Fenian murders at Manchester and Clerkenwell, and at once, *erectis auribus*, they are on the alert, and their faculties of listening and attention are willingly strained to the uttermost. No need of romantic fiction when bare facts can be found so enthralling. No sensational novel could be half so sensational or new as that dastardly destruction in the narrow street by the Clerkenwell prison; and events that thus come home to the hearts and feelings of "the rude, unlettered sons of toil" are, in their narration, listened to with the most unfeigned and all-absorbing interest.

It may be urged that the need for such "newspaper readings" is happily becoming rare, and would be restricted generally to rural villages, or perhaps to certain classes in such pit and mining districts as "the Black Country." In some degree this point might be conceded. Where people can not only read, but can also understand and digest what they read, then, each for himself and by himself, may be a private hearer of the preacher from the pulpit of the press.

In most towns, to say nothing of the expensive clubs and of those news-rooms the subscription to which is rarely less than a guinea a year, the humbler classes of the community are usually able to see the leading news-

papers of the day at their mechanics' institutes, penny news-rooms, working men's clubs, and, better still, at the reading and refreshment-rooms, based on a similar plan to those first started in Edinburgh in 1852, which are now becoming general throughout the country, and which, without professing to look to their supporters solely from the body of total abstainers, are yet to be regarded as antagonistic to all public-house evils. A few villages can already boast of such excellent institutions, which are established at a small cost, and pay their own way; and the spread of them, both in town and country, is a thing to be desired. Until this is done, and until education shall have sufficiently advanced to enable every man to be a reader, the public newspaper readings to which I have referred might probably be adopted with advantage, in certain places and on special occasions. These readings, so far from being any novelty, would take us back to the very origin of the printed news-sheets in England, which were suggested by the Venetian Gazzettas. These were the communications on home and military affairs, which the Government of Venice, during the Turkish war of 1563, thought fit to communicate to the people, and which were read to any one who paid a gazetta, or farthing, for the privilege. Thence, both the name and thing passed through France to England, whose first gazette, or public newspaper, was the "Weekly Newes," started by Nathaniel Butler, May 23rd, 1622. The occasional sheets of news that had appeared prior to that date are to be regarded rather as pamphlets; and it was to them that Burton referred, when he complained (in 1614): "If any read now-a-days, it is a play-book or a pamphlet of news." The play-books were indeed read; and, although Ben Jonson could write a piece called "The Staple of News," in which he describes the "Mercurius Rusticus," with the publisher's office and staff, and his method of collecting news, yet this was in 1625, three years after the establishment of Butler's paper. Now, as Shakespeare died in 1616, we necessarily lose the description that he would otherwise have given us of the English newspaper. This fact gives the greater point to an amusing mistake recently made by the two reverend doctors who have published the work called "The Life and Labours of John Campbell, D.D.," in which, in writing of Dr. Campbell's editorial labours in the "Christian Witness" and "British Banner," they say: "Speaking of newspapers, Shakespeare says 'They are the abstract and brief chronicles of the day, to show Virtue her own features, Scorn her own image, and the very age and body of the time, his form and pressure.'"

A far more serious mistake, however, and one which was allowed to pass current for many years, was made by Mr. George Chalmers, who, having to write on newspapers, made industrious research on the subject. In the course of these researches he discovered, in the British Museum, what purported to be copies of the "English Mercurie" newspaper, issued in 1588, while the Spanish Armada fleet was in the Channel; and, said Chalmers, "it may gratify our national pride to be told that mankind are indebted to the wisdom of Elizabeth and the prudence of Burleigh for the first newspaper." This statement was accepted by the writers of the day, including the elder Disraeli; and it also passed current on the Continent, and obtained a place in every foreign cyclopædia. It was not till some two or three-and-twenty years ago that the Chalmers bubble was exploded by Mr. Thomas Watt, of the British Museum, who, in investigating another subject, accidentally discovered and placed upon proof that these so-called newspapers were impudent forgeries, coarsely and clumsily executed on

paper that bore the watermark of one of the Georges. To the second Lord Hardwicke was attributed the forgery; and his sudden death probably prevented his explaining what was doubtless done as a private joke, but was destined to make the tour of the civilised globe as a veritable piece of history.

The arrival of Cowper's postman has its parallel passage in Crabbe's poem of "The Newspaper," wherein is depicted the anxiety with which those who are "far from town wait till the postman brings his packet down once in the week." This was almost as bad as in the earlier days of Ben Jonson, who represents a countrywoman coming to the newspaper office and saying, "I would have, sir, a groat's worth of any news, I care not what, to carry down this Saturday to our vicar." In the "Spectator," No. 452, is an admirably witty paper on the "general thirst after news," and the various ways in which that news was served up to the public so as to please its palate. Crabbe depicted the desire in such lines as these:—

"Those who ne'er deign'd their Bible to peruse,
Would think it hard to be denied their News;
Sinners and saints, the wisest with the weak,
Here mingle tastes and one amusement seek;
This, like the public inn, provides a treat,
Where each promiscuous guest sits down to eat;
And such this mental food, as we may call
Something to all men, and to some men all."

Yet, at that period, the passion for reading newspapers was but scantily gratified; the "Times" had not yet made its appearance, and, throughout the whole kingdom, there were barely eighty public journals. Two years after Crabbe and Cowper had published their thoughts and views on newspapers, Bishop Horne (in 1787,) wrote these words:—"Curiosity is the appetite of the mind; it must be satisfied or we perish. Amongst the improvements, therefore, of modern times, there is none on which I find more reason to congratulate my countrymen than the increase of knowledge by the multiplication of newspapers. With what a mixture of horror and commiseration do we now look back to that period of our history when a written letter came down once a week to the coffee-house, where a proper person, with a clear and strong voice, was pitched upon to read it aloud to the company assembled upon the occasion! How earnestly did they listen! how greedily did they suck down every drop of intelligence that fell within their reach!" That is a vivid description of newspaper reading; and although the Bishop pities the condition of the people who were compelled to study their public journals vicariously, yet we may extend the "commiseration" to many thousands at the present day, who, being unable to read for themselves, are almost as badly off for news as were the throngs of people when—as we see in Macaulay's History—they hastened to Whitehall, during that period of the Restoration when the newspapers were suppressed—clamouring to pick up the merest fragment of intelligence. How popular would have then been the man who could have given newspaper readings!

THE GHOST OF JOHN KOOMPANEE.

WALKING along Moorgate Street one day, from the Railway Station to the Bank, my eye fell on the words EAST INDIA COMPANY. They were painted on the side of a doorway, amongst the names of sundry occupants of premises having a common entrance. The great house in Leadenhall Street, I knew, had for years been removed, and India is now ruled from an Imperial Palace in Whitehall. Could this be the East India Company?

or had I misread the words, and seen the name merely of some Indian trading house or firm?

Turning back, I read indeed the words—East India Company. Curious to see the local habitation of a company with a name once so great, I ascended the stairs, prepared with some question to justify the visit of a stranger. On opening the door not marked "private," a clerk emerged from an inner apartment, by whom, after some conversation, I was courteously shown the room where the Court of Proprietors hold their meetings. It is a large apartment, with little furniture besides table and chairs. A Mercator's map of the world, an oil painting representing Commodore Dance beating off the French fleet, and a framed print of the India House in Leadenhall Street, are the sole decorations of the walls. On the table lay some blue-books and ledger-like folios. A strange stillness pervaded the place, though in the very heart of the busy city. A General Court had been held a few days before, the chief business at which had been the re-election of two directors, who had retired by rotation, and the re-installation of Colonel Sykes, M.P., as Chairman.

Mentioning my little adventure a few days after to a friend in the India Office at Westminster, he gave me the following curious statistics. The East India Company now consists, besides the proprietors of stock, of a Chairman, five Directors, a Secretary, and a Clerk. For the offices in Moorgate Street they pay a rent of £250 per annum. Of all the vast territories and establishments once in their possession they now hold nothing, all having been transferred to the Imperial Government. Even the far-famed Oriental Library and Museum have passed from their hands. The Court of Directors now simply hold in trust the Capital Stock, and also the Security or Cumulative Fund, to wit, £2,000,000 invested in 1834 in the Funds for the redemption of the Company's Stock; which sum, by re-investment of the proceeds, now amounts to nearly 6½ millions. The dividends guaranteed by the British Government are paid at the Bank of England, and may be redeemed by Parliament in the year 1874. The Capital may then be purchased at £200 for £100 Stock. If the purchase should be found inconvenient, the existence of the Company may be prolonged, no doubt to the satisfaction of the proprietors of stock, who are now guaranteed 10½ per cent. dividend. The Company receive a grant of £800 per annum from the Secretary of State for India, for defraying salaries and incidental expenses. A Court of Directors is held once a month, and a General Court of Proprietors twice a year.

Of all the strange "revolutions of empire" which this world has seen, none have been stranger than the rise and fall of the East India Company. It is little more than a century since the grant of the Dewanee territory laid the foundation of the British empire in the East. For a century and a half before 1765, there had been a succession of chartered Companies of "merchants trading to the East Indies." Footing had been obtained in various places, by favour or by purchase, where factories were established, and forts erected, gradually raised to the name and rank of Presidencies. Within the narrow limits of these possessions, clerks and supercargoes plied their trade, by permission of the native rulers.

When Clive drew the sword in the service of the English merchants, the age of conquest began. What names crowd the annals of the Company's Raj in half a century! Hastings, Coote, Cornwallis, Lake, Wellesley! John Company became Koompanee Bahadoor, lord of an empire with more than a hundred millions of subjects, and an army of nearly half a million of men. The

Rajahs of the East had almost all become tributaries and servants of the Company, and if any retained a nominal independence, an English Resident was the real lord of the land. Still conquest or annexation went on, till in the days of Napier and Dalhousie the Company ruled from the sea to the Himalayas. Not without checks and reverses was this progress, such as the Affghan War, the Sikh invasion, and, most perilous of all, the Sepoy revolt. But the shadow of native empire passed away when the last of the Moguls died a prisoner in Burmah. The descendants of the proudest princes of the East are now pensioners of the British Parliament, and the ambition of native kings is to be decorated by the English Viceroy with the order of the Star of India.

In London the visible sign of the passing away of the Company's Raj was the sale of the East India House and its contents in Leadenhall Street. Huge bills on the walls and pillars had announced the event.

"A poster on the pillars set for show.
What is't? Some bulletin of Indian battles?
A kingdom taken in? why, surely, no!
A sale by auction of the goods and chattels!"

One week in May 1862, a crowd assembled in the building, a crowd very different from that which used to fill the Court Room in former times. An auctioneer took the place of the Chairman of Directors. "Going, going, gone!" resounded, with the accompanying emphatic rap of the hammer, till nothing remained to tell of the long connection of the pile with "the wealth of Ormus and of Ind."

"Going!—what's going? Gone!—ah, gone indeed!
Generals and Governors who graced this board;
The grave Durbar that bade the soldier speed,
The feast that welcomed home his conquering sword.

"Gone;—Clive, the country boy, of Plassy dreaming;
Hastings, arraigned by Justice than earth's;
Cornwallis, Elphinstone, and Wellesley, seeming
Noble by more nobility than birth's;

"Heber's pale lips, in pious hymnals moving
For all those millions of his Eastern sheep;
Napier, his good sword drawn, rough, just, and loving;—
Theirs, and a thousand memories these walls keep.

"Gone now! A crowd of Hebrews—broker, touter—
Stands in the place of those majestic men.
Oh! mighty moralist, of self-praise scouter,
Point here a moral—sharpen hence a pen."

Well, the fashion of this world passeth away. It does so not only as an inevitable law, but oftentimes as a beneficent arrangement; and it cannot be doubted that the affairs of India will be better administered by the direct authority of the Crown, influenced by the whole-some power of public opinion.

That the change from the Company's rule to that of the British Crown was a change for the better, is doubted by none but a few who have grown grey in the old service. The Sepoy Mutiny hastened a crisis which had long been impending. The genius and virtue of many of the Company's servants had veiled the evils of the Company's rule. So long ago as 1784, the year when "the Board of Control" was established by Parliament, Cowper the poet thus wrote:—"The Charter constitutes them a trading Company, and gives them an exclusive right to traffic in the East Indies; but it does no more. It invests them with no sovereignty; it does not convey to them the Royal prerogative of making war and peace, which the King cannot alienate if he would. But this prerogative they have exercised, and, forgetting the terms of their institution, have possessed themselves of an immense territory, which they have ruled with a rod of iron, to which it is impossible they should even have a right, unless such a one as it is a disgrace to plead—

the right of conquest. The potentates of this country they dash in pieces, like a potter's vessel, as often as they please; making the happiness of thirty millions of mankind a consideration subservient to that of their own emolument; oppressing them as often as it may seem a lucrative purpose; and in no instance that I have ever heard, consulting their interest or advantage. That Government, therefore, is bound to interfere, and to unking these tyrants, is to me self-evident." In verse as well as prose Cowper denounced the "corporate misrule" of the Company, while admitting the personal virtues of many of the rulers and of their servants:—

"Men, immaculate perhaps,
In all their private functions, once combined,
Become a loathsome body, only fit
For dissolution, hurtful to the main.
Hence merchants, unimpeachable of sin
Against the charities of domestic life,
Incorporated seem at once to lose
Their nature, and disclaiming all regard
For mercy and the common rights of man,
Build factories with blood, conducting trade
At the sword's point, and dyeing the white robe
Of innocent commercial justice red."

Grievous wrongs were certainly perpetrated, and glorious opportunities neglected, under the old régime. May the lessons and warnings not be lost under the Imperial rule of our Eastern possession!

But descending from these high themes, let us muse on the strange contrast between the existing condition of the East India Company and its former state when enthroned in Leadenhall Street.* A few quiet gentlemen meet in a hired room and transact some routine business. What a change from the scenes in the General Court Room in the olden time! The Chairman then sat with as much dignity and authority as the Speaker of the House of Commons. The business before the Court was often as momentous as that which occupied the Imperial Parliament. There were set speeches and smart debates, motions and counter-motions, amendments and adjournments, stormy and even riotous meetings. Hear Lord Macaulay's account of the Courts: "All the turbulence of a Westminster election, all the trickery and corruption of a Grampound election, disgraced the proceedings of this assembly on questions of the most solemn importance. Fictitious votes were manufactured on a gigantic scale."† At a later period the discussions about the permission of missionaries to carry the gospel to the East were marked by turbulent scenes. All honour is due to the noble-hearted men in the direction who persevered in their efforts in the cause of Christianity. Their labours, we doubt not, averted many a judgment, and prolonged the time of the Company's probation.

The General Court Room, until the abolition of the trade of the Company, was the old Sale Room. Four times

* According to tradition, the first members of the company met for business in a room of the Nag's Head Inn, opposite Bishopsgate Church, where there is now a Friends' Meeting House. The next generation provided themselves with a building for their own exclusive use. This was in Leadenhall Street, on a part of the present site. There is a view of it among the prints in the British Museum, quite unique, which originally figured on the shop bill of William Overley a joiner in the locality. It was an edifice of timber and plaster, adorned with quaint carving and lattice work, corresponding to the style of the Elizabethan age, as appears from that cut. Above the windows was a painting which represented a fleet of merchantmen tossing on the waves. At the top, in the centre, a huge square-built wooden mariner looked down upon the passengers in the street, with the figure of a dolphin at each corner. The new East India House was erected in 1726, except the portico, which was added in 1797. Views of the old and new India House were given in the "Leisure Hour" for 1861.

† In 1763, Clive laid out £100,000 in the purchase of stock for nominal proprietors, whom he brought down to the debates.

a year, in March, June, September, and December, the Tea Sales were here held, amidst tumult and uproar, as great as marked any of the political debates. Above a million pounds of tea were sometimes sold in a day. There were about thirty firms of tea brokers, whose representatives were attended by a dense body of tea dealers. The sales were effected amidst shouting and howling far out-sounding the tumult of the Bourse at Paris, and the noise used to startle even the butchers in Leadenhall Market. But all through the year the great house in Leadenhall Street was a scene of busy life. How could it be otherwise, with its multitude of officials and departments? There was the military department, the shipping department, the Examiner's office, the Accountant's office, the Transfer, the Treasury, and we know not how many other branches of business and administration. In 1833 the Act was passed by which the monopoly of trade was doomed, and it was then that the name of "the East India Company" was authorized. In 1838 a Parliamentary return gave the number of persons on the Home Establishment at 494, with salaries amounting to £134,454. This number included porters, watchmen, messengers, and other attendants. Before the closing of the trade there were above 400 clerks in the Home Establishment. Twenty years ago there were still 150. Now there is one solitary clerk in the employment of the East India Company!

ROMANCE OF HERALDRY.

BY THE EDITOR OF "DEBBETT'S HOUSE OF COMMONS."

IV.

In tracing the origin of various insignia that are emblazoned in the arms of many families, historical incidents are brought to light that would otherwise be buried in oblivion. And to this circumstance may be attributed much of the interest that is centred in heraldry by those who have studied more than its rudiments. Though the records existing concerning the grants of arms are comparatively few, yet are they too numerous for all to be chronicled in our columns. The anecdotes previously related have, many of them, been replete with interest, and the following traditions and narratives (at random strung) respecting the armorial bearings of some of our titled notables are not less entertaining.

In the arms of the Duke of Norfolk are two separate charges, each of which possesses historic interest. In the first quarter, on a bend argent, is an escutcheon or, with a demi-lion pierced through the mouth with an arrow. This alludes to the circumstance of the body of King James IV of Scotland being found pierced with an arrow after the battle of Flodden Field, September 9th, 1513, when the Earl of Surrey gained a great and decisive victory over the Scots. Sir Walter Scott, in his "Tales of a Grandfather," states that so fiercely was this battle fought that the Scots lost upwards of 10,000 men, and that "there is scarcely a family of name in Scottish history who did not lose a relative there." On the Earl of Surrey's return to England, he was created Duke of Norfolk by King Henry VIII, who also augmented his paternal coat of arms with the before-mentioned charge. The third quarter, which is chequy or and azure, bears

the insignia of the Warrens, Earls of Surrey, who, having in bygone times the grant of licensing public-houses, ordered that every licensed innkeeper should display the Warren arms upon the exterior of his house, a circumstance that gave rise to the frequent and familiar sign of The Chequers.

The singular crest borne by Lord Exmouth, of the wreck of the Dutton, East Indiaman, upon waves of the sea on a rocky shore off Plymouth garrison, with the motto "Deo adjuvante" (God being my helper), had

its origin in a valorous deed performed by the first baron, when Sir Edward Pellew. The gallant knight was refitting his frigate, the *Indefatigable*, at Plymouth, in January, 1796, when a violent storm arose, which drove ashore, as a perfect wreck, the Dutton transport, which was conveying the Queen's Own Regiment of Foot to the West Indies. Sir Edward and his lady had engaged to dine on the same day with a friend, who, on their arrival at his door, communicated to them the distressing intelligence. Immediately on hearing it, Sir Edward opened the opposite door of his carriage, and disappeared with marvellous rapidity, followed by his friend. On the latter's arrival at the Hoe, he found the knight struggling through the breakers, and in the act of mounting the ship's deck by means of the mainmast, which had fallen ashore. Arrived on board, he immediately assumed authority, and exerted himself with so much calmness, intrepidity, and skill, that, with the exception of a few drunken sailors, all on board, including many women and children, were got safely on shore, while he was among the last who left the ship. His Majesty King George III, hearing of the circumstance, created Sir Edward a baronet, and awarded the crest before indicated.

The Marquis of Lansdowne bears in the first and fourth quarterings of his arms a magnetic needle pointing to the polar star, a charge that refers to the arctic discoveries made by his ancestor, Sir William Petty, a successful and celebrated navigator. The first crest, of a bee-hive, alludes to the industry of the knight; and the second crest, of a sagittarius, an astronomical emblem, to his fame as an astronomer.

The present Viscount Downe is lineally descended from Sir William D'Aunay, who held, *temp.* Richard I, a high command in the army of English Crusaders, when serving before Acon. In memory of a daring deed of valour performed by his ancestor, the noble lord bears as his crest a demi-Saracen in armour, couped at the thighs, and wreathed about the temples proper, holding in the dexter hand a ring, or, stoned azure, and in the sinister a lion's gamb erased or, armed gules. During the Holy Wars, it was customary for the infidel champions to challenge the Christian warriors to single combat whenever opportunities presented themselves. Upon one occasion, when Sir William was riding at some distance from the

English camp, he espied a Saracen emir, richly armed and well mounted, approaching him, at the head of a body of men about equal in number to his own attendants. Halting their troops at a little distance from each other, the Moslem challenged the knight to single combat, an offer that was promptly accepted. The contest was soon decided, the infidel being slain by the Champion of the Cross. Sir William, however, had no sooner proved himself to be victorious than he was subjected to a terrible and unanticipated danger. The slain emir, according to a custom then prevalent among the natives of the East, was in the habit of carrying in his train a lion. This animal, which had been taken as a cub among the ruins of Babylon, had grown to a remarkable size, and was peculiarly fierce, except to his master and immediate attendants, of whom he was very fond. At the time of his master's fall he was present, being held in leash by some of the emir's followers, who, seeing their lord fall, and with a view to avenge him, slipped the noose from the lion's neck and let him loose upon Sir William. The valiant knight, however, in nowise dismayed at this second foe, forbade his archers to shoot the animal, and, rushing upon his antagonist, lance in rest, pinned it to the earth. Cœur de Lion, who from a distance had beheld the combat, was delighted at the double victory, and gave the knight a ring from his own finger, with permission to bear the crest previously described. The annulets, or rings, in the arms also allude to the king's gift.

The frette in the arms of Baron Audley (see illustration, second and third quarterings), and in those of the families of Dutton, Delves, Foulhurst, and Hawkestone, are said to have been thus gained:—Prior to the battle of Poitiers, Lord James Audley vowed that, if possible, he would be foremost in the fight; and, supported by his four brave

squires, Dutton (now represented by Baron Sherborne), Delves, Foulhurst, and Hawkestone, he kept his knightly word, and was ever in the thickest of the *mêlée*. Though his squires warded off many blows that were aimed at him, he was nevertheless severely wounded; and, when the English were found to be victorious, he was carried back to the camp bleeding, and almost insensible. Being borne into the presence of the Black Prince, Edward took him by the hand, courteously greeted him, and bade him be of good cheer, as he had nobly redeemed his pledge by being foremost in the enemy's ranks. The prince also gave him lands in England, the income of which was worth five hundred marks a year. This gift Audley divided equally among his squires; and when the prince inquired whether he despised the gift, or thought it insufficient, he answered, he was deeply sensible of his lord's kindness, but his own possessions were sufficient for his wants, while his squires needed money. The prince, not to be outdone in generosity, presented him with another five hundred marks; and Audley, in order that the merit and valour of his squires might be held in perpetual memory, enjoined them to bear in some part of their coats-of-arms his own proper achievement, and the motto "*Servabo fidem*" (I will keep faith). The title and estates subsequently, however, devolving upon the Touchet family, the arms of that house are borne by the present baron in the first and fourth quarters, and also the motto "*Je le tiens*" (I hold it).

The first and fourth, and the second and third quarterings in the arms of the Earl of Kintore, are both stated to have originated in historical incidents. During the reign of Kenneth II the Danes, in one of the many descents they made upon Scotland, were defeated by Kenneth in a battle fought near Dundee, and their general, Lamis, was slain. In this action an ancestor of the present earl showed such proofs of extraordinary valour that Kenneth, in token of his admiration, dipped his finger in the blood of Lamis, and drew three stripes across the warrior's shield; a circumstance that is indicated in the emblazon of the second and third quarters, which are argent, a chief paly of six, or and gules. The other quarterings are of a much more recent date; they are gules, a sceptre and sword in saltire, with an imperial crown in chief, within an orle of eight thistles or, the motto being "*Vive ut vivas*" (Live so that you may live). These were granted by Charles II to Sir John Keith, Earl Marischal of Scotland, for having saved the Scottish Regalia from being seized by Oliver Cromwell after the great battle of Dunbar, by burying them in Kinneff Church. Sir John escaped to France, and it was not until the Restoration that he disclosed the hiding-place, a service which the king rewarded by bestowing upon him a peerage.

Baron Gifford bears two crests, viz.: a panther's head couped, affronté, spotted, incensed proper; and a demi-archer, bearded and couped at the knees, in armour proper; from his middle a short coat, paly argent and gules; at his middle a quiver of arrows or, and in his hands a bow and arrow drawn to the head; the motto being "*Prenez haleine, tirez fort*" (Take breath, pull strong). The origin of these insignia is due to the following circumstance:—In the early part of the reign of Henry VIII a panther, which had been presented to Sir John Gifford, of Chillington, escaped from its cage, and was pursued by the knight and his son, with bows in hand. At about a mile from the house they overtook the beast, just as it was about to spring upon a woman and her infant. Sir John, who was almost breathless, while preparing to shoot the animal was addressed by his son in the words of the motto, and, in pursuance of the advice, paused to take breath, drew his bow strongly, took steady aim, and killed the panther.

The arms of the Earl of Kimberley are sable, chevron or, guttée de sang, between three cinquefoils ermine; the drops of blood on the chevron having been added as a reward for the valour of his ancestor at the battle of Agincourt, where he attended Henry V as one of his esquires.

The Rev. William Chichester O'Neill, of Shane's Castle, County Antrim, who has recently been created a peer under the style of Baron O'Neill, traces his descent in a direct line from the Milesian kings, and bears as his arms a sinister hand couped and erect gules, with a salmon in base swimming in water. The origin of the hand is thus stated. When the ancestor of the family was preparing, in company with several adventurers, to make a descent upon the coast of Ulster, it was unanimously decided that whoever touched the land first should be esteemed chief of the territory. O'Neill, finding that instead of succeeding in heading his competitors in the race for dignity, he was losing ground, drew his sword, lopped off his left hand and threw it on shore as far as he was able. In this way he touched the earth first and acquired sovereign power. The water with the salmon therein naant, alludes to the famous fisheries of Lough Neagh and the river Blackwater.

THE MYSTERY CLEARING UP.

THE MORTONS OF MORTON HALL.

CHAPTER XLIV.—THE ARRIVAL OF THE MOHAWK PACKET SHIP.

MARY TALBOT found the secrecy which had been temporarily imposed upon her by Jemmy Tapley almost insupportable.

Thomas Dickson still remained at Cliff Cottage. He had taken advantage of his master's indolence and carelessness to extend the term of his warning to its utmost limit, and consequently to receive his wages as a servant up to the moment when he expected to enter into business on his own account. The three months had, however, nearly expired, and his arrange-

No. 861.—JUNE 27, 1863.

ments for taking possession of the "public" at Falmouth were almost completed.

So long as he continued at Cliff Cottage, and was under Jemmy Tapley's eye, the old sailor was in no hurry to hasten matters while any portion of the guilt of which he was suspected remained unproven. Jemmy had again seen Mr. Ferret at St. David, and had discovered that the lawyer held more than one secret interview with Thomas Dickson; and though he was still at a loss to conceive what secret business two persons so dissimilar could have in common with each other, he was resolved to find out its nature, if possible.

D D

PRICE ONE PENNY.

Probably, had he been aware that after Dickson's last interview with Mr. Ferret a sum of money had passed from the lawyer's into the servant's pocket, in exchange for a certain document which the latter had held in possession, the old man might have felt himself bound to communicate his suspicions to Mr. Aston; and probably, had Dickson been aware that he was so closely watched, he would have attempted to make his escape from the village, even if he were compelled to let the long-coveted "public" slip through his hands.

Thus matters rested at St. David when the Mohawk packet-ship was signalled off the Land's End, and it was expected that she would arrive at Falmouth on the following day.

Rejoiced as Mary was at the prospect of again seeing the brother whom she had mourned as one that was dead, her joy was somewhat dashed by the feelings of anxiety and uneasiness which still occupied her mind; and when her uncle invited her to accompany him to Falmouth to meet her brother and her (as yet) unknown cousins, on their landing from the ship, she excused herself on the plea that she feared the excitement would be too much for her.

The truth was, however, that she required time and solitude to collect and arrange her thoughts. She was doubtful whether or not she ought to acquaint her brother, before he came to St. David, with all that had occurred since his departure. She believed it would be better to remain silent for the present; because she feared if she spoke of her troubles in any way, she would be unable to conceal from Henry the facts she had heard from Jemmy Tapley, and had promised to keep secret. If she were to acquaint her brother with these facts, he, in his indignation and his desire to exculpate himself from guilt, would be sure to disclose the facts to his uncle, and thus, perhaps, the old sailor's plans would be foiled. The more she thought the matter over, the more she doubted which was the wiser course to pursue; until at length, despairing of any satisfactory conclusion, she resolved to be guided by circumstances after she had seen Henry, and, for the present, to strive to dismiss the subject from her mind.

It was late at night when the Mohawk arrived in Falmouth harbour; consequently the passengers did not leave the ship until the next morning. At day-break, however, the boats were seen leaving the side of the packet, and a crowd of people of all ranks and conditions were assembled on the quay, some having come to welcome the return of friends or relatives; others to look after their own business, and make what profit they could out of the new arrivals; and yet others, from sheer curiosity to witness the debarkation.

Among the first-named stood Mr. Aston, who recognised his son and daughter and nephew in the first boat which approached the landing-place. The boat reached the steps; the passengers stepped on shore; and the next moment Henry and Mary Morton were clasped in their father's embrace.

"Welcome to old England, my dear children!" exclaimed Mr. Aston, as soon as the first transports of parental and filial affection had partially subsided. "I hope," he added, "that before long you will learn to like both the country and the people."

"We crossed the Atlantic with that intention, dear papa," replied Mary. "But where," she added, "is the new cousin whom we expected to greet us on our arrival?"

"Your cousin Mary, my love," replied Mr. Aston, "feared the excitement of meeting her brother in the presence of strangers. She thought it better to remain

at home to welcome you to St. David. But your question reminds me that in my delight at seeing you and your brother again, I have been remiss. I have not yet welcomed home my nephew Henry. Where has he gone?"

Henry Talbot, though disappointed at not meeting his sister, had found an unexpected friend awaiting his arrival, who had greeted him joyously as soon as he had set foot on shore. He was in close and earnest conversation with his friend, when his uncle approached towards him, and greeted him almost as affectionately as he had previously greeted his son and daughter.

While Mr. Aston was conversing with his nephew, the stranger who had met him when he came on shore—a young man a year or two older than himself—stood by, looking on at the party.

"Uncle," at length said Henry, "let me introduce to you and my cousins, Sir Arthur Lockyer, my old schoolfellow at Eton."

The young man thus presented to the party was tall, and somewhat stoutly built for his years. His features were good, and his general appearance prepossessing. He bowed to Miss Morton, and shook hands with her father and brother, and the party proceeded to the hotel at which Mr. Aston usually put up, all walking together. As they neared the hotel, however, Henry Talbot kept somewhat in the rear of the rest, with the young baronet.

"Now, Arthur," said he, when his uncle and cousins were out of hearing, "explain how you came to meet me immediately upon my return to England. I had no idea that you knew that I was about to return."

"Why, my dear fellow," replied Sir Arthur, assuming a tone of great gravity, "I thought you would find it very unpleasant if you were to be arrested and thrown into prison as soon as you set foot in England. So I hurried to Falmouth, having heard that you were a passenger on board the Mohawk, that I might be at hand to bail you, if bail would be accepted."

"Arrest—prison!" exclaimed Henry, deceived by his friend's look and voice. "I know of nothing for which I could be arrested, unless you yourself were to cause me to be arrested for the debt due to you, which I confess I am at present unable to repay. I don't owe a farthing in the world besides."

"My dear Henry," returned the young baronet, "I thought it was solemnly agreed upon between us that you were never to allude to the trifling loan you received from me; which, by the way, I cannot claim if I would, since I hold no bond against you. Nevertheless, I find that you have acquainted your sister with the circumstances—"

"I!" exclaimed Henry, interrupting Sir Arthur. "I have never spoken a word upon the subject to any one, except that I told my sister, on my return to St. David from London, that a generous friend had lent me the money."

"If you had heard me out, Harry," continued the young baronet, "I should have told you that it was through a letter respecting the loan, received from your sister, that I learnt that she had been in sad trouble respecting a *souvenir* you purchased for her, which proves to have been a portion of a robbery committed in the village of St. David. I was joking when I spoke of arrest. But your sister has learnt by some means, that I lent you some money, and she wrote me requesting to state that such was the fact, in order that your innocence might be made apparent. I received the letter, on my return to Paris from Germany, some weeks after it had been written; and as, to tell you the truth, I could not

well understand what your sister wanted me to do, and moreover, scarcely knew how to write to a lady on the subject, I thought my better plan was to come over and see you—I having also learnt from her letter that you were shortly to return to England. I accordingly set out from Paris, and arrived at Falmouth yesterday, when I was told that the Mohawk was expected, and that you were a passenger on board. Now you know all that I know about this mysterious matter.”

Sir Arthur's explanation only served to bewilder his friend.

“There is some strange mystery afloat, Arthur,” he replied. “I cannot comprehend why my sister should write to *you*, nor why she has not come to meet *me*. You must go with me to St. David, at all events, in order that the matter may be cleared up. I——”

“Hillo! What amphibious animal is this?” suddenly exclaimed Sir Arthur, interrupting his friend.

This exclamation was caused by the approach of an old wooden-legged sailor, who came stumping along in great haste, as if to intercept the young men before they should enter the hotel, into which Mr. Aston and his son and daughter had already passed.

“It's old Jemmy Tapley—a friend and acquaintance of mine at St. David, and a great favourite of my uncle's and sister's,” said Henry.

“Ah,” replied Sir Arthur, jestingly, “depend upon it he also has come to warn you, to judge from his serious look.”

“Ay, Master Henry; aw'm main glad to see 'ee back safe,” exclaimed Tapley, who now came up and seized the young man's hand. Then, glancing aslant at the young baronet, he went on almost in a whisper—

“Aw coom'd to see 'ee afore tha goes to th' village. Aw ha' summud special to tell 'ee.”

Sir Arthur, however, had caught the words, and, bursting into a laugh, he said—

“I thought as much. Your amphibious friend has come on the same errand as myself.”

“All this may be very amusing,” replied Henry, his face flushing; “but I insist upon knowing immediately what is the meaning of it.”

“Hush, hush, my dear fellow,” said the baronet, placing his hand on his friend's arm. “Don't you see, the people are wondering what is the matter with you. Can't you take a joke?—which is not, however, altogether a joke, since it has brought me from Paris in such haste. Let's go into the hotel. Bring your sailor friend in with you, and perhaps we shall soon come to a mutual understanding.”

They entered the hotel, Jemmy Tapley following at Henry's request, and went to a private room before they joined Mr. Aston and his children. Here the old seaman explained, as well as he was able, all that he knew relative to the theft of Mr. Aston's pocket-book; and though he did not speak of the suspicion which had been attached to Henry and his sister by the village folk, he said enough to make the young man understand that such a suspicion had caused his sister much grief and anxiety; but that the actual thief had been discovered, and the mystery would soon be cleared up.

Henry's anger and indignation were so great, that it was only with much difficulty he was prevailed upon, through the joint persuasions of his former school-fellow and the old sailor, to restrain himself until he reached St. David and saw his sister. However, he at length consented to be guided by Jemmy Tapley, and he and his friend rejoined the others of the party. An hour later they took their seats in the carriage that Mr. Aston had engaged to convey them to St. David, though

Henry was so much disconcerted by what he had heard that, greatly to the surprise of his uncle and cousins, he remained silent and vexed throughout the entire journey to the village.

CHAPTER XLV.—THE RETURN TO FALMOUTH.

MARY TALBOT was waiting at the gate of Cliff Cottage to receive and welcome her brother and cousins when the carriage reached St. David. Glad, however, as she was to see her new cousins, for the time being all her thought was for her brother, and in her happy reunion with Henry, whom she had long mourned as lost to her for ever in this world, all her troubles and anxieties were temporarily forgotten. For the space of an hour after the arrival of the carriage, it would have been difficult to find a happier party than that assembled in Mr. Aston's cottage.

At the end of this period, however, Mr. Aston was summoned from the room by his housekeeper, who said that Jemmy Tapley wished to see him.

“To see *me*!” said Mr. Aston, in a tone of surprise. “Show him into the study;” and, wondering what the old seaman could want with him, Mr. Aston left the room. He had not been absent many minutes ere the housekeeper again appeared, with a request that Miss Talbot would go to her uncle in the study.

Henry and Mary Morton glanced inquiringly at each other, as if to ask what was the nature of this mystery. Their astonishment was, however, increased when, after the lapse of a few minutes, the housekeeper re-entered the room, with a request from Mr. Aston that Sir Arthur Lockyer would oblige him by going to the study.

“What does all this mystery mean? What can be the matter? Can *you* explain, cousin Henry?” inquired Mary Morton, unable longer to restrain her curiosity.

Henry Talbot shook his head.

“I can't say,” he replied. “For my own part, I have found myself involved in mystery since the moment I landed at Falmouth.”

“If papa and cousin Mary and Sir Arthur do not soon come back to us,” said Miss Morton, with a smile, “I shall begin to suspect that we have been inveigled to England for some secret purpose, and that they are plotting mischief against us in the study. It really is very droll, and somewhat rude too, I think.”

Further remark was, however, prevented by the tramp of many feet on the stairs, as though several persons were approaching, and presently the parlour door was thrown open, and to the surprise, and somewhat to the consternation of the inmates, Jemmy Tapley, and a stranger who had the appearance of a country shopkeeper, entered the room, followed by Thomas Dickson, in the custody of the village constable—though still wearing his master's livery—while Mary Talbot, her uncle, and Sir Arthur Lockyer, brought up the rear. Mr. Aston, as soon as the door was closed, approached his nephew, and, grasping the young man's hand, said—to the increased amazement of his son and daughter—

“My dear Henry, I have to ask your forgiveness for having wronged you—at least in thought, if not openly. I have been informed, since I left this room, that you have been made partially acquainted with the circumstances which, during your absence, have caused annoyance to your sister, and, to a certain degree, to myself.

“That villain,” he continued, pointing towards his cowed and trembling servant, “has been the cause of all

our trouble and anxiety; and no punishment can be too severe for one who has not hesitated to gratify his own greed, and to avert evil from himself, to cast suspicion upon the innocent."

At this point, Mr. Aston was interrupted by a tap at the parlour-door, and presently—evidently greatly to the delight and satisfaction of Jemmy Tapley, but to the surprise of every one else, and to the increased trepidation of Thomas Dickson—Mr. Ferret made his appearance.

A few words sufficed to explain who he was, and what was the object of his visit. Holding forth a soiled and worn slip of paper, he said, addressing himself to Mr. Aston—

"You will, no doubt, sir, recognise this document. It is a certificate of the birth and baptism of Henry Morton, youngest son of Edward Morton, Esq., of Morton Hall."

"I do indeed recognise it," replied Mr. Aston, "though I cannot conceive how it has come into *your* possession. I lost it some months since, together with other and more valuable property. The document is, in fact, valueless to any one save myself; and I hardly know why I removed it from the Bible which was given to me by my mother when I was a child. Still, I am more pleased to recover it than if it were something of more intrinsic value."

Mr. Ferret then briefly explained all that the reader has already been made acquainted with respecting his advice to Mr. Foley, with this difference—viz., that he made it appear that Mr. Foley had been induced, by a sense of justice and equity, to relinquish his possession of the Morton estates as soon as he discovered, through the receipt of an anonymous letter, that the direct heir to the property was living and in England, and, moreover, that he had purchased the document (now presented) of the writer of the letter, who believed it to be of great value, only that he might aid in exposing the villainy of a trusted servant.

Mr. Aston was scarcely less astonished at the lawyer's explanation than he had been when he was informed by Jemmy Tapley that Thomas Dickson was the man who had robbed him of his pocket-book and its contents. He was surprised to learn that Mr. Foley, of whom he had conceived an evil opinion, was a man of such honourable feelings, and much gratified at the promptitude with which he had recognised his, the *soi-disant* Mr. Aston's claims, and, shaking hands heartily with Mr. Ferret, he begged the lawyer to assure his *cousin* Foley (placing an emphasis on the word *cousin*) that he would not find him (Mr. Aston) deficient in generosity. He added that he had had no doubt at any time of his ability to prove his claim to his father's estates, and that he had only delayed to prefer the claims because he had not yet decided as to the course he would pursue.

Mr. Ferret bowed, and was satisfied with the result of his advice. He had gained his object on behalf of his employer, and he now retired to a distant part of the room, and watched the proceedings with a lawyer's interest.

A long explanation took place, to which Henry Talbot listened with surprise and indignation, which he found it hard to control. As, however, the reader is aware of all that had occurred during the young man's absence from England, it is unnecessary to repeat the details.

Jemmy Tapley was warmly thanked for the trouble he had taken to discover the stealer of the pocket-book and its contents, though the old man honestly confessed that he had been actuated, in the first instance at least,

chiefly by a desire to vindicate the characters of the fishermen.

"You see, ladies and gentlemen," he said, "a fisherman arn't ersackly a blue-jacket; still, he be summut akin to a sailor arter all, and aw could not abeer as anybody as had ought to do wi' salt water should be suspicioned o' sich a crime."

The crime had, in fact, been fully brought home to Thomas Dickson previous to the arrival of the Mohawk. There was but one piece of evidence wanting to exculpate Henry Talbot from any complicity with the misdeed. This evidence Mary Talbot had despaired of being able to obtain, until the appearance of Sir Arthur Locker made everything clear.

Finding himself thus brought to bay, Thomas Dickson acknowledged his guilt, and told how he had seen his master place the money in the pocket-book the day before he was seized with illness, and how, when Mr. Aston was brought home by the fishermen, he had taken the book from his master's coat-pocket in the belief that he would never recover, and that the theft would never be discovered. In that belief he had parted with the locket, and, to prevent a chance of discovery, had requested that it should be broken up, or melted down as old gold.

Mr. Aston was doubtful whether justice did not demand that he should prosecute his dishonest and treacherous servant; but, after a consultation with his friends, he decided to lean to mercy's side. The miserable culprit was only too glad to restore the money he had stolen, and that he was to have paid for the lease of the public-house on the following day; and, having done this, he was released from custody, and with his last quarter's wages in his pocket, which were paid that he might not be turned adrift penniless, to commit fresh crimes, he was ordered to leave the house forthwith, and never to dare to set foot again in St. David.

After some further conversation with Mr. Aston, Mr. Ferret departed for Morton Hall to acquaint Squire Foley with the result of his diplomacy; and Caleb Jakes returned to Falmouth, with a liberal reward for the part he had taken in exposing Thomas Dickson's guilt. Jemmy Tapley, after shaking hands with Mr. Aston and his children and friends, set forth to spread the news of the discovery of the thief who had stolen the pocket-book through the village; and the party at Cliff Cottage spent the rest of the day in quiet, conversing over the various events which had occurred since the day when Henry Talbot had embarked for America.

CURIOSITIES OF BATTERSEA.

BY JOHN TIMBS.

BATTERSEA, the village of Surrey which lies on the Thames, opposite Chelsea, claims a sort of historical relationship to the latter place, by reason of its having been a seat of our porcelain manufactures, and being of Saxon origin. Its name was anciently written *Batrics-ey*, and in Domesday-book *Patrics-ey*, probably a mistake for *Petrice-ey*, and signifying St. Peter's Isle, the termination *ey*, from the Saxon *eze* or *ize*, often occurring in the names of places adjacent to great rivers; as Putney, Molesey, Chertsey, etc., upon the banks of the Thames. The manor was held by Earl Harold at the Conqueror's Survey, and was given by him to the Abbey of St. Peter, at Westminster, in exchange for Windsor. After the suppression of monasteries, the manor remained vested in the Crown; it was assigned towards the maintenance of Henry, Prince of Wales,

in 1610, and after his decease to his brother, Prince Charles. In 1627 it was granted to the St. John family, in whose possession it remained till the year 1763.

Notwithstanding the growth of Battersea, the older portion has a deserted aspect; it has, however, many memorials and things of note, though its historic interest culminates in its association with the St. Johns. One is stated to have been "eminent for his piety and moral virtues;" his son pleaded guilty of murder in a sudden quarrel arising at a supper party, but was relieved on paying £16,000. Here, in a spacious mansion at the east end of the church, was born, in October, 1678, Henry St. John, who became Secretary of State to Queen Anne, by whom, in 1713, he was created Baron St. John of Lidiard Tregose, and Viscount Bolingbroke, who, on the decease of his father, became possessed of the Battersea property, and held it until his death, in 1751, in his seventy-ninth year. Here Pope spent most of his time with Bolingbroke, after the return of the latter from his seven years' exile. His recall had been assented to by Sir Robert Walpole, on whom Bolingbroke waited to thank him, and was invited to dine with him at Chelsea; "but," says Horace Walpole, "whether tortured at witnessing Sir Robert's serene frankness and felicity, or suffocated with indignation and confusion at being forced to be obliged to one whom he hated and envied, the first morsel he put into his mouth was near choking him, and he was reduced to rise from table and leave the room for some minutes. I never heard of their meeting more."

Bolingbroke House became also the resort of Swift, Arbuthnot, Thomson, Mallet, and other contemporary men of genius. And here took place the memorable destruction of one of Bolingbroke's most celebrated works, his "Essay on a Patriot King," of which the noble author had printed only six copies, which he gave to Lord Chesterfield, Sir William Wyndham, Lyttelton, Pope, Lord Marchmont, and Lord Cornbury, at whose instance Bolingbroke wrote the Essay. Pope lent his copy to Mr. Allen, of Bath, who was so delighted with it that he had five hundred copies printed, but locked them up in a warehouse, not to see the light until Lord Bolingbroke's permission could be obtained. On the discovery, Lord Marchmont (then living in Lord Bolingbroke's house at Battersea) sent Mr. Gravenkop for the whole cargo; and he had the books carried out in a waggon, and burnt on the lawn in the presence of Lord Bolingbroke. He resided nine years at Battersea, and sank under the dreadful malady beneath which he had long lingered—a cancer in the face—which he bore with exemplary fortitude; "a fortitude," says Lord Brougham, "drawn from the natural resources of his mind, and, unhappily, not aided by the consolation of any religion; for, having cast off the belief in revelation, he had substituted in its stead a dark and gloomy naturalism, which even rejected those glimmerings of hope as to futurity not untasted by the wiser of the heathens."

The greater part of Bolingbroke House, a mansion with forty rooms on a floor, was taken down in 1778. In the wing left standing, a parlour of round form and lined with cedar was long pointed out as the apartment in which Pope wrote his "Essay on Man." It is said to have been called "Pope's Parlour."

About half a century ago there was living in Battersea a Mrs. Gilliard, a pleasant and intelligent gentlewoman, who well remembered Lord Bolingbroke; that he used to ride out every day in his chariot, and had a black patch on his cheek, with a large wart over one of his eyebrows. She was then only a girl, but was taught to look upon him as a celebrated man. As, however, he

spent little in the place, and gave little away, he was not much regarded by the people of Battersea. Of his contemporaries, the old lady recollected none excepting Mallet, whom, she said, she had often seen walking about the village while he was visiting at Bolingbroke House.

Bolingbroke, with his second wife, niece of Madame de Maintenon, rest in the family vault in St. Mary's Church, Battersea, where is an elegant monument by Rou-billiac, with bas-reliefs of the great lord and his lady. The epitaphs on himself and his wife were both written by Bolingbroke; that upon himself is still extant, in his own handwriting in the British Museum, and is as follows: "Here lies Henry St. John, in the reign of Queen Anne Secretary of War, Secretary of State and Viscount Bolingbroke, in the days of King George I and King George II, something more and better. His attachment to Queen Anne exposed him to a long and severe persecution; he bore it with firmness of mind. He passed the latter part of his life at home, the enemy of no national party, the friend of no faction, distinguished, under the cloud of proscription, which had not entirely been taken off, by zeal to maintain the liberty and to restore the ancient prosperity of Great Britain." The monument is of grey and white marble; the upper part has an urn with drapery, surmounted by the Viscount's arms; and the lower portion bears the epitaph, flanked by medallions in profile in bas-relief.

Another monument commemorates the descent and preferments of Oliver St. John, Viscount Grandison, who was the first of his family that settled at Battersea. When studying law at one of the Inns of Court, he killed in a duel the captain of the guard to Queen Elizabeth, and champion of England.

At the east end of the church is a central window, in three divisions, filled with old stained glass that was preserved from the former church, and was executed at the expense of the St. Johns. It includes the half-length portraits of Henry VII, his grandmother the Lady Margaret Beauchamp, and Queen Elizabeth; together with many enrichments and numerous shields of arms, showing the alliance of the family. The portrait of Elizabeth was placed here, because her grandfather, Thomas Boleyn, Earl of Wiltshire (father of Queen Anne Boleyn), was great-grandfather of Anne, the daughter of Sir Thomas Leighton, and wife of Sir John St. John, the first baronet of the family. In the south gallery is the monument of Sir Edward Wynter, which has been much noticed on account of the exploits recorded by the inscription and sculpture. He appears to have been a friendless but adventurous youth, who, by his courage, diligence, and good conduct, became eminent as an East India merchant; and as the epitaph states—

"Nor less in martial honour was his name.
Witness his actions of immortal fame!
Alone, unarm'd, a tiger he oppress'd,
And crush'd to death the monster of a beast.
Twice twenty mounted Moors he overthrew
Singly on foot; some wounded, some he slew,
Dispers'd the rest—what more could Sampson do?"

At the top is a large bust of Sir Edward, in a flowing peruke and lace cravat, and underneath the inscription are sculptures in low relief, of his struggling with the tiger, and his combat with the Moors. He died March 2nd, 1685-6, aged 64.

Near at hand is a monument—a small statue of a mourning female leaning upon an urn—erected by the benevolent James Neild, in memory of his wife Elizabeth and of her father, John Camden, Esq., whose son, John Camden Neild, lived in Cheyne Walk, Chelsea, and be-

queathed to Queen Victoria the whole of his property, £500,000. At the east end of the south aisle is a tablet to Thomas Astley, Esq., F.S.A., keeper of the records in the Tower, and who wrote "On the Origin and Progress of Writing." And in the churchyard lies Arthur Collins, compiler of the excellent "Peerage" which bears his name, and which he published "at the Black Boy, in Fleet Street." Here, too, is the grave-stone of William Curtis, the botanist, author of the "*Flora Londinensis*."

In the church register occur these instances of longevity:—Goody Harleton, aged 108 years, buried 1703; William Abbot, 101, 1733; — Wiat, 100, 1790; and William Douse, 100, 1803.

In the Lower Wandsworth Road, in this parish, at a Baptist Chapel, there took root a great work, about seventy years since, when the Rev. Joseph Hughes became pastor. By his energy, learning, and eloquence, and his connexion with different local societies for the promotion of religious worship, he was brought acquainted with Mr. Wilberforce, Mr. Vansittart, and Mr. Perceval, by whose aid he established "the Surrey Mission Society." At a meeting of the Religious Tract Society he afterwards promulgated the idea of an institution for supplying not only the inhabitants of the British Isles, but *the whole world*, with copies of the Holy Scriptures; and hence arose *the Bible Society*, of which Mr. Hughes was secretary until his death.

Upon part of the site of Bolingbroke House was erected a horizontal mill, by Captain Hooper, who built a similar one at Margate. It consisted of a circular wheel, with large boards, or vanes, fixed parallel to its axis; and upon the vanes the wind acted so as to blow the wheel round, one side of it being sheltered from the action of the wind by its being enclosed in framework, with doors or shutters to open and admit the wind, or to shut and stop it. If all the shutters on one side were open, whilst all those on the opposite side were closed, the wind, acting with undiminished force on the vanes at one side, whilst the opposite vanes were under shelter, turned the mill round. But whenever the wind changed, the disposition of the blinds had to be altered, to admit the wind to strike upon the vanes of the wheel in the direction of a tangent to the circle in which they moved.—(Dr. Paris's "Philosophy in Sport.") This mill resembled a gigantic packing-case, which gave rise to an odd story, that when the Emperor of Russia was in England, in 1814, he took a fancy to Battersea Church, and determined to carry it off to Russia, and had this large packing-case made for it; but as the inhabitants refused to let the church be carried away, the case remained on the spot where it was deposited. This mill served as a landmark for many miles round, and thus Bolingbroke House became converted into a malting-house and a mill; but the proprietor preserved portions of the mansion as well as he could, and loved to smoke his pipe in Mr. Pope's parlour, and think of him with due respect as he walked the part of the terrace opposite his room. The grate and ornaments were of the age of George I; and before the window remained a portion of the terrace, with the Thames flowing majestically under its walls. The upper part of the horizontal mill has been taken down; the lower part is still used for grinding corn. The walls of "Pope's Parlour" may still be seen; but they support a new roof, and can only be distinguished from the rest of the building by their circular form. The situation of the old mansion is indicated by the names of Bolingbroke Gardens and Bolingbroke Terrace given to the buildings adjoining.

Battersea had formerly another historic mansion, Brygge Court, which Lawrence Booth, Bishop of Dur-

ham, built, and by the king's licence enclosed with walls and towers, and imparked "his land there, with the right of free warren and free chase therein." Bishop Booth was translated to the archiepiscopal See of York in 1476, and bequeathed this property to the Dean and Chapter of York, as an occasional residence when the Archbishop visited London. The name was then changed to York House. Archbishop Holgate was one of the few prelates who resided here; he was imprisoned and deprived by Queen Mary, for being a married man, and lost much property by illegal seizure. Strype, in his "Life of Cranmer," relates that the officers who were sent to apprehend the Archbishop rifled his house at Battersea, and took away from thence £300 worth of gold coin; 1600 ounces of plate; a mitre of fine gold, set with very fine diamonds, sapphires, and balists; other good stones and pearls; some very valuable rings, and the Archbishop's seal in silver; and his signet, an antique in gold. Scarcely any part of the ancient mansion remains; much of it was taken down about forty years ago. It is said to have been often confounded with York House, Whitehall, where Cardinal Wolsey entertained Queen Anne Boleyn. There was long a tradition that some ancient walls remained at Battersea, of the residence of the Boleynes, who were related to the St. Johns. Now it is contended that Wolsey resided at York House, Battersea, where he first saw Anne Boleyn. The interview is more commonly believed to have taken place at York House, Whitehall; but Shakespeare, in his plays, makes the king come by water; and York House, Battersea, was a residence of Wolsey, and provided with a creek from the Thames, for approach to the house. This may be a question for future editors of Shakespeare to settle. Some sixty years ago, the owner of this York House removed a superbly painted room, with a dome, which is the background of an ancient print representing the first interview of Henry VIII with Anne Boleyn.

Battersea Bridge, which communicates with the upper part of Chelsea, was built in 1771-2, at the expense of fifteen proprietors, each of whom subscribed £1500. Its present yearly income is estimated at £5,000; but it is unworthy of its position across a river spanned by some of the finest bridges in the world. It is put to shame by the iron suspension bridge, completed in 1858, from the site of Ranelagh, to Battersea Park; and is still further eclipsed by the noble railway bridge across the Thames, at Pimlico. The park, which has been formed out of small Lammas lands at Battersea, had its surface raised by a million cubic yards of earth brought from various sources: it contains one of the richest collections of shrubs and trees in or near London; its soil is specially suited to the rose.

On the river bank, nearly opposite the gardens of Chelsea Hospital, was the noted Red House, famed for aquatic sports and pigeon-shooting feats. At about fifty yards westward is the place at which Cæsar is reputed by some antiquaries to have crossed the Thames by a ford, by which the British retreated before the Romans, and were followed by Cæsar and his legions. One who has surveyed the ford describes it, at ordinary low water, as a shoal of gravel not three feet deep, and broad enough for ten men to walk abreast, extending across the river, except on the Surrey side, where it has been deepened by raising ballast; and the causeway from the south bank may yet be traced at low water. The place of crossing is, however, more generally believed to have been at Chertsey, or Kingston. The latter was anciently called Moreford, or the Great Ford. Battersea was long famous for growing, in

its rich alluvial soil, the finest asparagus, of such extraordinary size that one hundred and ten heads, in a state fit for the kitchen, have been known to weigh more than thirty-two pounds. But the market-gardeners and florists complain grievously of the injury they sustain from the noxious vapours of chemical works, smelting furnaces, etc., in this hitherto rural district.

This brings us back to the connection of Battersea with a branch of our porcelain works, namely, *transfer printing*, or printing from copper-plates, by which the artistic character of the porcelain was much raised. The priority of the invention had been claimed for Liverpool; but Mr. Binns, F.S.A., in his very interesting "History of Worcester Ware," traces the claim of transfer-printing to the Battersea Enamel Works at York House (the Archbishop's old palace), where Ravenet and other artists drew for Alderman Jansen. These artists wrought in engraving plates, from which impressions were taken on enamel plaques, etc., for snuff-boxes and like articles. The Liverpool claim to the invention dates from 1756; whereas Horace Walpole writes from Strawberry Hill, six or seven miles from Battersea, to R. Bentley, September 18th, 1755, "I shall send you a trifling snuff-box, only as a sample of the new manufacture at Battersea, *which is done with copper-plates*." A snuff-box, with a transfer engraving, which is in the possession of Mr. Morgan, bears the masonic date 5754, *i.e.* 1754. Another example is dated the preceding year. The Battersea Works failed. Alderman Jansen's stock, furniture, etc., were sold by public auction, March 4th, 1756; and a writer in the "Athenæum" thinks it probable that the plates sold in London, and some of the Battersea workmen, found their way to both Worcester and Liverpool. In the former place, porcelain works had existed since 1751. We possess a specimen of a mug, painted with a portrait of the King of Prussia, a group of military trophies, etc., with the Worcester mark, date 1757, which usually passes for the earliest example of this branch of ceramic art. There is also a specimen in the Museum of Practical Geology, in Jermyn Street.

We have still to add a curiosity of our own day. This is a stupendous railway-bridge across the Thames at Battersea, and stated to be the *widest railway-bridge in the world*. It consists of four arches, each one hundred and seventy-five feet span in the clear, with a rise of seventeen feet six inches. The immense ribs which support the superstructure are formed throughout of wrought iron, and are firmly attached to massive cast-iron standards, which are placed over the piers. The whole of the framework is thus made continuous throughout. On each side of the river is a land-arch of seventy feet span, making the entire length of the bridge one hundred and forty feet. The abutments were put in by means of cofferdams, and the foundations are carried down thirty feet below Trinity high-water-mark. The piers are built upon the same principle as that which was first applied by Sir Charles Fox to the building of the bridge at Rochester across the Medway, and which has been employed on the Thames in the construction of the Blackfriars, Charing Cross, and Cannon Street railway-bridges.

TWO MONTHS IN SPAIN.

V.—MALAGA.

I LEFT Seville on the 4th of December, for Xeres. I had an introduction to one of the largest wine exporters in the city, and, but for that, I might have passed it *en route* to Cadiz, which would have been a subject of regret, as it is a place of great commercial importance

both to England and Spain. The gentleman to whom I had an introduction is a countryman, and received me with a Scottish welcome. I went over his extensive cellars, or bodegas, as they are called, and tasted some of his fine old sherries, worth £130 per butt. The wine called "Amontillado," so much patronised in England, is not, as some suppose, the production of Montilla, near Cordova, but of this district. My friend was good enough to explain to me the mode of mixing and keeping up the stock of "old wines." I am afraid to mention the value of the stock in the various cellars that I visited, but it was something very considerable. The exports last year from this neighbourhood were 60,000 butts; and, taking them at the minimum value of £30 and £70, this would be three millions sterling. The wine casks that are in the bodega are never removed, but filled up with new wines; and the wine is drawn off in portions from different casks, as it ripens, into fresh casks for shipment, so that the quality is kept in equilibrium. A very rich sweet wine is made from grapes which have been put two or three days in the sun. This wine is kept to mix, and correct the taste of the other wines when they are wanted less dry and fruity. The vintage runs through September and October, and the process is very simple. The wine-presses which I saw were about ten feet square and eighteen inches deep, and each of these was supposed to contain grapes sufficient to yield a butt of wine. The men get into the presses with their bare feet; and, when the juice is thus exhausted, a little water is added, and the residue pressed out by a screw. This wine is kept in casks till it ferments and clears, and in January and February is transferred to the stationary casks of old wine. The exhausted grape is carried to a distillery, where a spirit is produced, and used only to give body to the wines:

We drove a few miles into the country, and saw some of the large vineyards. This is the great wine-producing district of Spain, and the attention and labour required seemed a mere pastime. It is impossible to conceive how rich and spontaneous are the productions of this country, and the small amount of labour required. I have seen orange trees, planted by the Moors 700 years ago, with scarcely a particle of the trunk remaining but a thin shell and bark, with a healthy green foliage, and bending with a burden of fruit; and the same with olives. I have never seen such an abundance of fruit and vegetables anywhere. The large public markets of Seville, and even of this small city, are unequalled. Their table vegetables—cabbages, cauliflowers, carrots, and other garden stuffs—would carry off the prizes at any of our Horticultural Shows, with fruits of every clime, and of the finest quality.

"Oh what a goodly sight it is to see
What Heaven hath done for this delicious land,
What fruits of fragrance blush on every tree,
What goodly prospects o'er the hills expand;
But man would mar them with an impious hand!"

So wrote fifty years ago the author of "Childe Harold." Fifty years have made no change in the bounty of nature; but the people, ungrateful or unconscious of the blessings they enjoy, seem rather to retrograde than advance in everything political, social, and religious. This year there was a partial failure of the crops of wheat, and the people were getting restless about the price of bread. Hence the anomaly of importing wheat from the East and the Baltic, while there are millions of acres untilled, and left in weeds for donkeys to feed on, that would yield any amount of good crops, and made Spain, in fact, in the time of the Romans and Moors, one of the granaries of the world.

The journey from Xeres to Cadiz, by rail, occupies an hour and a half. The line winds round the head of the bay, passing the port St. Mary, called in the maps El Puerto. This and Xeres are the great entrepôts of the shippers of wine. At the head of the bay we passed Puerto Real, from whence sailed the "Spanish Armada" that was to annex England to the family property of Philip II! At San Fernando we saw large pyramids of salt, which is collected here in any quantity, from the flat marshes round the top of the bay, and shipped largely to England and other quarters. The railway runs under the walls of the forts right into the city.

There is not in Europe a finer situation than that of Cadiz. Seen from the sea, it has scarcely its equal, unless, perhaps, "Genoa the beautiful." The houses are from four to five storeys, built of white stone, or white-washed. The roofs are flat, and every other house has a turret; so that, with steeples, domes, and turrets, they form a perfect forest of pinnacles, breaking the line and glittering in the sun's rays. The city is surrounded by the sea, except a small neck which connects it with the mainland, about 250 yards broad, which is strongly defended by a succession of batteries, fosses, and drawbridges. The great drawback is the want of water. It is brought into the city in casks, or on the backs of mules and donkeys, and sold at a high price. A house, the rent of which is £10, will cost nearly £5 for water. The vendors carry it through the streets in earthen jars, and sell it at a farthing a glass. The streets look clean and well kept, and there is little life and activity beyond that of the towns in the interior. From the signal-tower, in the centre of the town, a fine view is obtained of the city and surrounding scenery. On the one side the broad Atlantic stretched out to the horizon, when I saw it, calm and bright as a mirror; and on the other side lay the beautiful bay, with vessels riding at anchor, up to the Puerto Real. It is curious that a Briton always feels more at home on the seaboard than anywhere else. He thinks he has a prescriptive right to claim kindred with the blue waves and white foam that roll over the sands, or dash against the cliffs, in chorus to his thoughts of home and happy England; and, coming from the wretched towns of the interior of Spain, he feels more at home, and amongst a more healthy and active population. There is not much in the way of sights in this city. The Club, or Casino, to which I had an introduction, is a handsome building, with marble-paved court and elegant vestibule, card, reading, and billiard-rooms, but poorly supplied with papers. The new cathedral is a fine building of the Corinthian order, the whole interior of marble and alabaster columns, gilt tabernacles, and jewelled virgins. Their Museo, or Fine Art gallery, is a small affair, and has only a few pictures of any merit. As in most Spanish towns, the great and rich monasteries and convents have been broken up, and their works of art scattered over the world, and the buildings appropriated for barracks, hospitals, and other useful purposes.

On the east side of the town, overlooking the ocean, and in a poor neighbourhood, there resides a colony of Gipsies, of the pure Oriental breed. These are nominally Roman Catholics, but live apart from other citizens, and intermarry with each other. They are of the true Hindoo type; and I am more than ever convinced that these wandering tribes, known in Europe as "Bohemians" and "Gipsies," are from Northern Hindostan, and such as I have met on the table-land of Mysore.

Great complaints are made here that the trade of the place is falling off, and that the people are starving, and of course the Spaniards are always ready to blame

the Government. In this instance I don't know that they are very far wrong, as every obstacle seems to be thrown in the way of free and healthy trade.

I had intended to proceed from Cadiz to Malaga by steamer, stopping by the way for a few days at Gibraltar; but I found all my plans upset, in consequence of some antagonism between Spain and Great Britain on the subject of quarantine. The Spanish Government, for some unaccountable reason, of either pique or obstinacy, for the last twelve months had put Gibraltar under quarantine, so that I could not go in there without undergoing three days' quarantine at Malaga, which I was not inclined to do; and consequently, greatly to my mortification, I had to retrace my steps to Cordova, to catch the train from Madrid to Malaga. This is but a trifling matter of personal inconvenience, as far as individuals are concerned; but the merchants, English and Spanish, complain most grievously of this interruption to trade. The Government of Spain is not satisfied with a clear bill of health from the last port, but you must show what previous port you were in; and, if that port was under quarantine, you are subject to all the expense and delay of quarantine. To make the subject more clear, I may explain that a vessel arrived some time ago at Cadiz, with coals from Newcastle; the captain was asked what port he had been in before, and, not suspecting the design, said he had come from Riga to Newcastle; and, the former port being under quarantine, he was ordered to take his vessel round immediately to Vigo, for ten days' quarantine, causing a delay of more than a month and an expense of £200. Every remonstrance was treated with contempt or insult. The master begged to be allowed to remain in Cadiz harbour for any reasonable time, when a peremptory order came from Madrid that "the vessel should proceed to the port of Vigo, to undergo quarantine." A short time previously the Spanish Government had agreed to make compensation to the owners of the Queen Victoria, for their wanton and impudent seizure of that vessel; but when? And how is compensation to be enforced? This was only one of the many acts of injustice and insult which the Spanish Government have put on England and English subjects of late years.

The return journey to Cordova by train occupies eight to nine hours. The frost had set in very sharp, and I had to pass another cold night in this miserable city, and had not a pen in my hand for three days. Nothing can be more wretched in a cold winter night than a Spanish inn. The Fonda Suiza, in Cordova, is perhaps as near an approach to comfort as can be found in that city. It is a large semi-Moorish building in the form of a quadrangle, with the usual court or patio, and corridors paved with marble. One side of the quadrangle is occupied by the *salle à manger*, where there is neither fire nor fireplace; the long table is arranged for thirty or forty guests, with three oil lamps just sufficient "to make darkness visible," and the cold bare tiles for the feet to rest on. While we are waiting till the dinner is placed on the table, the chill seems to creep over the heart and stop the circulation of the blood, and it is only after a plate of warm soup and a little good wine that we feel returning animation. The natives come in muffled up to the nose in their large cloaks, and their usual cigarette, but all complaining of *mucho frio*. There was no warm room to retire to, with a book or newspaper, in short, no alternative but to walk round the cold corridors or go to bed.

I started next morning for Malaga, and had full compensation for the inconveniences of the previous evening.

in the pleasant and interesting journey between these two cities. The distance is only about 140 miles, and the ordinary train occupies eight hours; we left Cordova at 6 A.M., and arrived at Malaga at 2 P.M. The day was most beautiful, and the country through which we

better times—the granary of the world. As we approach Malaga, there is a range of hills that form a circle from east to west, through which the railway passes. The engineering on this part of the line is the most wonderful that I have ever seen, and one feels sur-

MALAGA.

passed, strange and picturesque: a succession of rolling undulations, each height crowned with a quaint old city or castle—Ayrshire, without its “honest men and bonnie lassies,” and its ploughs and industry, but most notably without those noble and richly wooded demesnes and green sloping lawns that give such charm and beauty to the British landscape. Perhaps there is not, in any country in the world, a more bare and dreary prospect than these fine but neglected valleys and undulations through which one passes from north to south of Spain. For miles, with the exception of the brown stunted olive trees, there is not sufficient cover for a squirrel. The country is but sparsely populated, and much of the land seems comparatively neglected. Mr. Ford says that “the gentry of Spain live in cities, in idleness, ignorance, and genteel dissipation.” Whether this be the case or not I cannot say; but certainly they are not to be seen in the country, nor is there anything to indicate the existence of that class which we in England call our country gentry. Philip III has had his wish: he has “left his country to his Church,” but no subjects in any proper sense of the word. The olive trees soon become monotonous. They are not picturesque; and, as they cover the face of the hills with a stunted sameness, the eye at length gets tired of them. The plains are of a deep rich soil, and only require a little labour and capital to be what they have been in

prised that man could have had the courage to carry through such an undertaking. As it is, I believe the lives of many men were lost in bridging over the chasms. It is impossible to conceive the wild grandeur of this rugged scene. The vast masses of rock rise on each side to the height of 1000 feet; the mountain stream rushes through a narrow gorge, over which is thrown a suspension bridge, and from which the sight is almost appalling; now we burrow through a solid rock, and now pass over a rich green valley, with orange, olive, and cypress trees. For more than an hour this wild and changing scene continued, till we came down on the fertile fields and gardens of Malaga, where the fields of green sugar cane and orange trees, cactus, palm, and aloe, gave token of the rich produce of the tropics.

The situation and climate of Malaga reminded me of Nice. It lies in the bosom of a range of hills that shelter it from the north and east winds; and although at that time they were suffering so much from cold in the interior of the country, the temperature was as mild as our finest day in May. They have a fine harbour, and I saw a great many vessels loading with wine, oil, oranges, raisins, and all kinds of dried fruits produced in this district. Far-famed is the sweet muscatel wine, as well as the fine raisins from the same vine, which grows here in abundance along the slopes

of the surrounding hills. This grape in its green state is also exported in great quantities, so that a good deal of activity is exhibited round the harbour. Those who are advocates of free trade say, "If we had a stable and constitutional Government that would give safety and security to property, and the duty on imports somewhat relaxed, so that we might reciprocate with other nations, there are scarcely any limits to the trade that might be done. Now there is no confidence, either in Government or individuals, and our restrictive tariffs exclude everything that would be beneficial to the country." Though the climate, as I have said, is very delightful, I fancy that very few persons would come to Malaga either for health or pleasure. The natives have not the most remote idea of what comfort means, and both English and Americans grumble immensely at the greed and extortion practised on strangers.

There are three big hotels in the city, but that is all you can say in their favour. The *Hôtel del Alameda*, on the Alameda, is perhaps the best, but even there great complaints are made of the absence of all comfort, care, and attention towards the inmates. One would think that when a Spaniard condescended to open an hotel, he expected all the homage to come from the customer to whom he offers his cold hospitality.

The town has still a great deal of the Arab character about it, and many of the natives still retain the type of their oriental origin. The present population is about 80,000, and they have introduced several cotton manufactories and iron foundries, which they are trying to foster by protection, and at the general expense of the community, which, I think, is a blunder; but that is their business. The leading merchants have established a club or casino—the nearest approach to comfort that I have seen in Spain—where English, American, and French newspapers are to be had, and which is open to visitors for fifteen days, on the introduction of a member. It is only after ten days' travelling through this benighted country that one can fully appreciate and enjoy a file of the English newspapers.

There is little of interest to be seen in Malaga, except, it may be, the Cathedral, which is the finest specimen of Greco-Roman architecture that is to be seen in Spain, and contains some very fair works of art.

Like most of the cathedrals in the south of Spain, it is built on the site of the great Mosque. It was not finished till near the close of the 16th century. The beautiful façade is flanked with two fine towers, one unfinished, and the other, forming the bell tower, rising to the height of 360 feet; and from which the view over land and sea is one of the finest that can be conceived. The building stands on a slight elevation, and, viewed from the harbour or from the hills behind, has a fine and imposing appearance. The interior will well repay two or three visits. The Corinthian columns rise in groups, supporting the lofty domes and roof; the altars are richly ornamented, and the choir, which is in the centre aisle, has some fine carvings and marble bas-relief.

There are some curious old Moorish gates and buildings still standing; but of these we have had enough in the cities that we have already visited. Here, as in most Spanish cities, the alamedas or public promenades, full of flowers, and watered by beautiful marble fountains, are the delight of travellers and the enjoyment of the inhabitants.

I may mention here, that the practice adopted in Spain for letters *post restante*, is different from any other country I have been in, and has its advantages

as well as disadvantages. All such letters are entered and posted up on boards, with date of receipt, name, and number attached to each letter, and hung out in the passages. The inquirer looks out for his name, and puts the number attached to each letter on a piece of paper, and, with his card or passport, presents them at the window. The difficulty here is, that scarcely one name is copied correctly, and one may have to go two or three times before he gets his letters. To get over this difficulty, I looked over the names on the board, for the range of five or six days that I expected letters, and took down every number the name to which had the slightest resemblance to my own, and presented them at the window. Perhaps I found three out of five letters for myself, all spelt differently in the list; and I suppose I might have taken the others also, for anything the clerks seemed to care. The complaint of the public is, that they have three men to do the work of one, and consequently the work is badly done. These post-offices are generally dark, dirty, and inconvenient. Even in Madrid the post-office would be a disgrace to any third-rate town in Great Britain. And in Malaga, a commercial city of 80,000 to 90,000 inhabitants, it is a poor dirty dilapidated building in a narrow out-of-the-way street.

I should mention, before quitting Malaga, that I was very kindly received by Mr. Mark, the British Consul, who has an hereditary claim on the respect and homage of every British subject, from the fact that his father was the first man who obtained permission for the formation of a Protestant burial-ground. Before his time the heretics were buried in the sea sands below water-mark, like dogs. This is the manner in which this peculiarly Catholic country guarded itself even against the heretical dead, so many of whom bled and died in the cause of Spanish independence.

Among the manufactures of Malaga, I was most pleased with the very pretty terra-cotta figures that are made here of the costumes of Spain; specimens of which were seen at our Exhibition of 1862.

PATRICK FRAZER TYTLER.

PATRICK FRAZER TYTLER, the well-known historian of Scotland, was the son of Lord Woodhouselee, a Scottish judge who attained great distinction both in his own walk in life, and in literature. The son resembled his father both in his literary tastes, and in following the profession of the law. But, from the first the law had little chance with the Muses, the Muse of History especially, and the son has obtained a wider reputation than the father, though not the same worldly prosperity and rank. But Tytler has still higher claims to respect than can be conferred by mere literary fame. When his life was written some years ago, it was entitled by his biographer, the well-known Mr. Burgon, of Oxford, "The Portrait of a Christian Gentleman." The ethical and religious lessons of his biography are exceedingly numerous; and at the same time the events of his life and the society to which he belonged possess a very high degree of interest, an interest in some respects unique.

When he was at Edinburgh he constantly met at his father's the most brilliant and intellectual society, of which that city has been able to boast at any period of its history. Here came Jeffery and Sydney Smith, Mackintosh and Sir Walter Scott, Dugald Stewart and Henry Mackenzie, Basil Hall and Leyden the poet, with many others more or less known to fame. His

father sent him to school in England. The school was kept by a pious clergyman of the name of Jerram, who was at that time curate to Richard Cecil.

Even when a boy of seventeen, at school, young Tytler's letters were marked with very great delicacy and accuracy of description. He attended service in the private chapel of Windsor Castle, and there he saw old George the Third. "The appearance of the King was very interesting. He walked without any support, except a stick, upon which he seemed to lean a good deal. He appeared almost completely blind; yet, probably from custom, he proceeded easily to his seat in the chapel, groping his way a little by the stick; and was dressed in a plain blue coat, with the regal star upon his breast, a little slouch hat and boots. But the most pleasing part of the scene was still to come—I mean his devotion. He heard the service with the most solemn attention, frequently raising both his hands and repeating the responses with a fine deep-toned voice."

When he returned home, Tytler began to apply himself diligently to the study of Scottish law. But he had hardly attained his majority when he lost his beloved father, whom he had always regarded with the deepest intensity of affection. Many years afterwards we find him writing: "To be resigned, I trust, through the grace of God and the mercy of my Saviour, I have already taught myself; but to forget is impossible. My heart must cease to beat, my memory become a blank, my affections wither, and my whole being change, before the love and goodness of my father, and the uninterrupted happiness of our life when he dwelt, surrounded by his family, in this earthly paradise, shall fade for a moment from my recollection."

When the armies of the Allies had occupied Paris in 1814, Tytler, who had just been called to the bar, accompanied by the present Sir Archibald Alison and other friends, paid a visit to France. He had the good fortune, chiefly through the kind services of Dr. Wylie, the celebrated Scottish physician to the Emperor Alexander, to be introduced to many of the distinguished persons who at that time had flocked to Paris. He heard some interesting anecdotes about the Duke of Wellington from Lord Lovaine, who had served under the Duke in Spain as a volunteer. He heard that a magnificent hotel had been fitted up in Paris for the Duke, and he insisted on leaving it and staying at Mr. Wellesley Pole's, whose house was quite full, and who could only offer him a *small dark closet*, where he received a visit from the King of Prussia. "He used to lie down in the corner of the room, sometimes on straw, sometimes on a hard couch, always with his clothes on. He never undressed, but on the contrary, dressed himself anew before going to sleep, and slept sound in a few minutes. He generally lay down in the same room where his aides-de-camp and other young officers were joking and romping around him. I have heard that during the retreat from Burgos, his mind was in such a dreadful state of anxiety, and his health in consequence so wretched, that his physician declared that he could not have lived unless it had been for his faculty of sleeping whenever he lay down."

Young Tytler returned home by way of Belgium and Holland. In one of his common-place books we find a passage full of deep feeling, on the temptations and dangers of travel, and the scenes which great cities present: "If the constant sight of all this has in any degree removed or lessened the deep horror for vice which I shall ever earnestly seek to preserve,—if this knowledge of the world, as it is called, has in any degree impaired my ardent love for what is pure and

excellent in nature, I do most deeply entreat the pardon of that God who is all purity; and I trust that now, when once again under that roof in which I was born, I may recover what I have lost."

Mr. Tytler made at first considerable progress at the bar. His father's great reputation, and the respect in which his memory was held, served him in very good stead. But his literary tastes more and more preponderated, and his memoranda show how exclusively his attention was devoted to poetry and the *belles lettres*. Lawyers and clients took the alarm. They did not conceive it possible that a literary man could be a first-rate advocate, and gradually withdrew their business. Even the law itself was chiefly regarded by him in its literary and archaeological aspects. He contributed a few articles to periodical literature, but he early recognised the importance of devoting himself to some special branch of literature. His illustrious friend, Sir Walter Scott, gave him a hint on this subject which decided the bent of many future years. He had been dining at Abbotsford, and, in the course of the evening, Sir Walter took him aside and suggested to him the scheme of writing a history of Scotland. Sir Walter had himself devised something of the kind, but he saw that it required an amount of labour and research which he had no time for. He suggested to Mr. Tytler that he should undertake the task. Although startled by the magnitude of the work, the more he meditated on it the better was he pleased with the idea, and before long he began to make collections towards the subject.

Soon after his marriage, Mr. Tytler published a little work on the "Life of Wycliffe." We find him still attending the law courts, but his heart was far away with his work and with his wife. "My dearest love," he writes to her from the Scotch Exchequer Court, "I am sitting here with our Baron sound asleep; the others almost dozing, and the Chief Baron speaking of half a gallon of whisky with an energy that might do honour to — or Demosthenes. Seriously, nothing can be more trifling or uninteresting; yet here must I sit and wait till it is concluded."

In 1828-9 the first two volumes of his History of Scotland appeared. Sir Walter Scott wrote an article upon them in the "Quarterly Review," characterised both by kindness and candour. Mr. Tytler's researches in the State Paper Office had enabled him to bring to light a whole mine of valuable information. Subsequently he went to London, where his friend Mr. Lockhart, the editor of the "Quarterly Review," introduced him to Mr. Murray, the eminent publisher. He made arrangements with Mr. Murray which led to the publication of his "Lives of Illustrious Soldiers." He now saw, but how changed! the Duke of Wellington in the House of Lords, whom he had last seen during the occupation of Paris by the allied armies. Mr. Tytler has left the following remarks respecting his own mental state while visiting the huge modern Babylon: "My first feeling in London has been this time the same as it always is, a sense of loneliness and desertion; the misery of bustle with the consciousness of solitude. This I seek to relieve in two ways: the first (for which I bless God) is to pray often, wherever I may be, and to seek a nearer communion with the Source of all love and goodness, in his own way, through my Saviour. This calms me, and I am at peace. The second is, to write to my best and dearest love, who is, and ever will be, more perfectly dear than any mortal thing; and to whom my thoughts in absence constantly revert, with a fondness I cannot explain."

The health of his beloved wife was such as to cause

serious disquietude to her husband. He took her for one winter to the mild climate of Torquay. On their way they passed through Oxford. Tytler obtained a glimpse of the Bodleian Library, which filled him with a student's rapturous delight. "It was but a passing glance; yet delight was mingled with regret; and if it pleases God to spare me, we shall, I trust, return again. The quiet, ancient, monastic look of the place—the gray tranquillity thrown over all—the noble stores of books and manuscripts, and the great men looking down from the walls, all seem to make this place the very retirement which a student might desire, or rather dream of."

London, however, rather than Oxford, was his place of study—in the State Paper Office, and in the library of the British Museum, where indeed his extraordinary application on one occasion brought on a serious fit of illness. The next winter, by the advice of his physician, was spent in the Isle of Bute. The climate seems, however, to have been unfavourable for Mrs. Tytler's health, who, having lasted through the winter, died in the early spring. "Full of pure and humble faith, sustained by a most blessed hope, and overflowing with sweetest charity, she breathed away her gentle spirit in her husband's arms, murmuring the name of Jesus."

After this bereavement Tytler took his motherless children southwards, and occupied a house at Hampstead. Subsequently he removed to Wimpole Street. We are told that "constant prayer, large daily study of the Bible, and the religious education of his little children, became now his constant occupation and his only joy." As time rolled on, in many ways his grief became assuaged. His literary labours occupied him fully, and he performed an important service to literature, by the evidence which he gave before a Committee of the House of Commons, about his plan of making the national archives available for historians. After a very long interval, the advice has been acted on, and the publication of the calendars, now in progress, forms an era in our historical literature. He was one of the first members, and almost a founder, of the "English Historical Society." In one of his holidays he visited Dunblane, and "passed a sweet day in dear Leighton's library." This was the library of the great archbishop, and Mr. Tytler transcribed the abundant notes which Leighton had made in his copy of George Herbert's poems.

Mr. Tytler resolved on bringing all his furniture from Edinburgh to London, to a house which he had taken in Devonshire Place. Sydney Smith came to see him in London with the express object of looking at the furniture which he used to know so well in Edinburgh. Thus Miss Tytler tells the story: "And he did come; and stopping short in the middle of the drawing-room he exclaimed, 'O ye chairs! friends of my early years! Ye tables! which so oft have witnessed "the feast of reason and the flow of soul," blooming yet in immortal youth! How do ye mock my grey hairs! And thirty pounds, did you say? All transported for thirty pounds? packed up in the smallest possible compass—piled up against the wall—taken by measurement, and two captains to bid down each other. Wonderful nation, singular people!' How Sydney Smith laughed, and how we enjoyed this visit! It is impossible to say what an interest we felt in seeing how every piece of furniture fitted into its appropriate place, and how easily we could arrange the drawing-room to look as it did in Prince's Street, even to the mirrors between the windows, and the large round tea-table in the middle of the room—that tea-table which recalled such a glorious tea-drinking, when Walter Scott, Dugald Stewart, Playfair,

Henry Mackenzie, and other intimate friends sat around it; with pyramids of cakes, saucers of strawberry jam, and tea and wit of the purest flavour freely circulating around."

In the summer the family used to go to Hampstead, where their good friend Joanna Baillie resided, at whose house they had the advantage of meeting many distinguished people from all parts of the world. Mrs. Baillie knew a worthy old lady who kept a confectioner's shop, and the following anecdote is told about her:—

"Mrs. Joanna found her old friend Mrs. Mosé in sad distress, mourning over the death of Chief Justice Tindal, which had just taken place. 'Oh! ma'am,' she exclaimed, 'what a heavy loss to his country, for Justice Tindal was a right-thinking man.'

"'He was indeed an excellent man,' Mrs. Joanna answered; 'but I don't quite understand, Mrs. Mosé, what you mean by *right-thinking* man.'

"'Just a right-thinking man, ma'am. A man that took up with no new-fangled notions, but always ordered his mince pies *here* at Christmas.'

Something more should be said respecting Mr. Tytler's literary works. He contributed to the "Encyclopædia Britannica" the paper on "Scotland," which, published in a separate form, has enjoyed great popularity. Later he completed his History of Scotland. In his closing paragraph he says: "It is with feelings of gratitude, mingled with regret, that the author now closes this work, the History of his country, the labour of little less than eighteen years: gratitude to the Giver of all good, that life and health have been spared to complete, however imperfectly, an arduous undertaking; regret, that the tranquil pleasures of historical investigation, the happy hours devoted to the pursuit of truth, are at an end, that he must at last bid farewell to an old and dear companion." His intense labour, during the completion of his latter volumes, brought on, in 1841, a slight paralytic seizure. He thus alludes to the circumstance in some memoranda on the commencement of a new year: "It well becomes me to open this new year with expressions of the deepest gratitude to the Giver of all good things. The year just closed (1841) has been one of great trial and great support. How can I ever forget this time, or at least about this time, last year, when I was suddenly struck with an illness, which, although under the blessing of God it soon gave way to the remedies applied, was most serious and alarming at the time; and for two months incapacitated me for pursuing my ordinary studies. How merciful was this warning sent me by my heavenly Father that I was overtaxing my mind with my History, and pursuing too intensely and exclusively among minor objects! The blow might have been a far sharper one; it might have prostrated my bodily and weakened my mental powers, and rendered me a burden to myself and others: but how tenderly, how gently was it sent me! How loving was the lesson, how perfect has been the recovery! and to my gracious Father, how imperfect is my gratitude! If every moment of my life could be spent in praise, it would be yet too little for all that goodness and mercy which has followed me all the days of my life."

We find various notes of scenes of recreation so well earned by seasons of intense application. We follow him in the Highlands, where various of his relations were settled. "Walked over the hill by Glach Ossian to Autfield, taking leave of dear Jeanie and sweet Moniack. It was a lovely day, and the view from the hill above Dochfour enchanting; the whole country bathed in a rich golden air tint, and Loch Ness stretching out in a sheet of silver. I was happy, and very grateful to God

for my eyes. *Benedicite, omnia opera* came into my mind." We thus find him writing to his friend and biographer, Mr. Burgon: "My dear Johnny, I hope I shall be in Oxford on Wednesday, 21st December, see Johnny, stay a night at the nearest inn to Worcester College, and return to London on Thursday, the 22nd. What is the meaning of this sudden escapade? Shooting is the meaning, Johnny—killing hares is the meaning, and pheasants, and perhaps woodcocks. Still, all is in the dark. Well, hear, you Greek particle you! To the State Paper Office came, a little while ago, the Hon. and Rev. Mr. Bertie and Lady Georgina Bertie. . . . Mr. Bertie, a kind and gentlemanly man, hearing (how I know not) of my passion for research, sometimes taking a sporting rather than a literary direction, to-day, when I was deep in the ninth volume, suddenly fired off an invitation at my head. What could I do, Johnny? To come down to Albany, near Woodstock, to shoot on Tuesday, and to be driven by Mr. Bertie to Oxford on Wednesday, to see Johnny in his cap and gown—it was too much for me to resist. So I capitulated, accepted, and am to come, all keeping well, on the 21st. Ever, dear Johnny, yours." Her Gracious Majesty took a great deal of notice of Mr. Tytler, and honoured him with her command to dine at Windsor Castle; and when he would have taken his departure, he was invited by special command to stay longer at the Castle. We give an extract from his narrative of his visit:—

"Soon after luncheon Mr. — came with a message from Mr. Murray to say I must meet him immediately, to go and see the Prince of Wales and the Princess Royal, who were coming into the corridor with the Queen. Away I went, joined Mr. Murray, and got to the corridor, where we found some of the gentlemen and ladies of the household; and after a short time, the Queen, with the two little children playing round about her, and a maid with the Princess Alice; Prince Albert, the Duke of Cambridge, the Duchess of Kent, Prince Hohenlohe, and some of the ladies in waiting came up to us; and her Majesty bowed most graciously, having the Prince of Wales in her hand, trotting on and looking happy and merry. When the Queen came to where I was, and on my bowing and looking very delightedly, which I could not help doing, at the little Prince and her, she bowed, and said to the little boy, 'Make a bow, sir!' When the Queen said this, the Duke of Cambridge and the rest stood still, and the little Prince, walking straight up to me, made a bow, smiling all the time and holding out his hand, which I immediately took, and bowing low, kissed it. The Queen seemed much pleased, and smiled affectionately at the gracious way in which the little Prince deputed himself. All then passed through the corridor, and after an interval of about a quarter of an hour, Prince Albert, followed by a servant bearing two boxes, and having himself a large morocco box, came up to where I was, and told me he had brought the miniatures to show me, of which he had spoken last night. Then, in the sweetest possible way, he opened his treasures and employed more than half an hour in showing me the beautiful ancient miniatures of Holbein, Oliver, Cooper, and others; most exquisite things! embracing a series of original portraits of the kings, queens, princesses, and eminent men of England, and the continent also, from the time of Henry VII to the reign of George III. . . . I handed Lady — to dinner, and all went on very happily, without any stiffness. . . . There was nobody but herself and Prince Hohenlohe between me and the Queen. However, I do not believe I gave any offence; for her Majesty, when we came into the drawing-room, singled me out after a little time, and

entered into conversation upon the miniatures. I expressed my high admiration of them, and of their great historical value, and praised the Prince for the ardour and knowledge he had shown in bringing them together and rescuing them from neglect. Her Majesty seemed pleased, and questioned me about the portraits of Bothwell. I expressed the doubts I had stated to the Prince, as to there being any authentic picture in existence, but added that I would make myself master of the fact immediately on my return, which she seemed to like."

Some time after this Mr. Tytler had an agreeable letter from Sir Robert Peel, in which Sir Robert mentioned that his distinguished name had been put down for a pension of two hundred a-year. After this time we find him mingling a great deal in society. He was a frequent guest of the Duke of Somerset, and on one occasion we find him writing from the Duke's seat: "We had the Speaker here, Mr. Shaw Lefevre, of whom your friends the Misses Allen spoke so much. All they said was true; for I never was in company with a more agreeable man, full of anecdotes, funny, and without the least affectation of any kind. He is a noble-looking man too—quite like what the head of the Commons of England should be." Some time afterwards Mr. Tytler married for a second time, and under peculiarly happy circumstances. He and his bride went to Oxford for their holidays. "There is something about this old city which I have never seen or felt in any other place; an air of sweet solemn quiet, a religious repose which falls softly on the mind and disposes it to pure and holy thoughts. And then, for a studious man, its noble libraries, and the collections of MSS. in the different colleges, make it, I should think, a literary Paradise."

At length his health gave way in a mysterious manner, and he became a confirmed invalid. He disappeared from society. His whole nervous system became shattered. He sank into a state of despondency. Everything was tried, both at home and abroad, but nothing could rouse him. He became more and more exhausted. He caused the 121st Psalm to be read slowly and distinctly to him, in order, as he said, that he might understand it, and then took to his bed, which he never left again. On Christmas Eve, 1849, he kissed and blessed his children and gently sank away. He was buried in Grey Friars Churchyard, Edinburgh. His biographer concludes his life by saying that those who knew him best, declare that in him they beheld the truest impersonation of their ideal of a *Christian gentleman*. The following were the concluding words of his epitaph: "Of his genius and his tastes, his historical and biographical works are a sufficient memorial. Of his pure converse and delightful manners, his serene temper and lovely disposition, recollections are garnered up, where only they can be preserved, in the hearts of his friends. Of his piety, his faith, his hope and love, the record survives in heaven. 'Blessed are the pure in heart, for they shall see God.'"

PROVERBIAL COMPARISON.

THE use of just and appropriate comparisons is one of the characteristics of the clever writer and the correct and eloquent speaker. The force and fitness of a man's utterances will often depend upon the choice he makes of such means of illustration, and his readiness and sagacity in selecting them. If we take note of the involuntary checks and pauses that occur now and then in the deliverances of that numerous class who talk much faster than they think, or talk volubly without

thinking at all, we may generally trace the sudden "pull up" to which such talkers are subject, to the want of some element of comparison which, not presenting itself at the moment, has to be sought for in the memory or evolved from the imagination. It is almost needless to remark that the difficulty here suggested, though it must be familiar to all who write much, or talk much, is peculiarly the difficulty of the very numerous and varied class who are not qualified either by education or habit for writing or talking correctly.

In the matter of comparisons the popular genius has fructified in a manner more characteristic than classical, having yoked together in lasting companionship a list of nouns substantive, between which it is not always easy to discover the connection; while, with regard to some of them, it is evident that nothing more than a fanciful connection could exist, and that they derive their appreciation among the common people from that very fact. The origin of them it is perhaps not possible to trace; all we know of them is that they have been long sanctioned by custom, that tradition has in a manner stereotyped them, and that they live, and are likely to live, in the thoughts and language of the masses of our countrymen.

In making a selection from the list of comparisons with which the vernacular abounds, we will take first a few of the least incongruous. We would classify them in some kind of order if we could, but that is hardly possible; they refuse to be so handled, most of them possessing a rigid and perverse kind of individuality of their own.

Among those which may boast at least a seeming congruity, we may cite "as poor as a church mouse"—"as plain as a pike-staff"—"as sure as a gun"—"as tight as wax"—"as tender as a chicken," etc.; in all of which there is a considerable amount of appropriateness, as the reader must perceive, though none of them, we need hardly say, are literally correct; seeing that a church mouse, like other ecclesiastical hangers-on, may grow fat and sleek on the crumbs of office; that a gun may miss fire or miss its mark; wax may render up its trust at the instigation of heat; a pike-staff may be rough; and a chicken may be tough.

Less congruous than the above are the following and their like: "as thick as thieves"—"as sound as a roach"—"as bold as brass"—"as deaf as a post"—"as cool as a cucumber;" of which kind many more might be quoted. We feel that they are somewhat vague; and though their aptitude strikes us, we suspect that it does so rather because we have heard them so often, and accept them as conventional maxims, than because of any inherent propriety they can claim. We do not see why thieves should be more true to each other than honest men; a roach sounder than a perch or gudgeon; brass bolder than iron; a post more deaf than any other inanimate object; a cucumber cooler than a melon; and so on. Some few comparisons of this class, however, there are, which commend themselves by their neatness, and which are in a manner perfect; such as, "as right as a trivet" (a trivet, from its ingenious construction, being shut out from the possibility of assuming a wrong position)—"as clean as a smelt" (the smelt being assuredly the most delicately pure and clean of all fishes in the sea)—"as dead as a herring" (the herring dying the instant it is taken out of the water, and figuring as a dead fish in its salted condition much longer than any other)—"as dead as a door-nail" (a nail driven into a door being reasonably assumed to be coffered once and for ever).

Another class of comparisons seems to be quite arbi-

trary, being of the figurative kind, and some of them embody a little of that lurking satire and sarcasm with which the common people like to flavour their conversation. Among these we may quote, "as fine as five-pence" (applicable to cheap and tawdry finery)—"as cold as charity" (expressive of the general recognition of the fact that it is exceedingly hard to infuse any vital warmth into the first of all Christian virtues)—"as nice as ninepence" (evidently a figure of speech, though of obscure origin, possessing a charm from its alliteration, and a still greater one from its vagueness, rendering it of very wide application)—"as ugly as sin" (a suggestive sample of hyperbole)—"as clear as mud" (a favourite saying among emphatic disputants, in which, by a figure of rhetoric, the thing spoken of is made to stand for its opposite)—and, "as good as gold," which is meant to express the very perfection of personal merit.

Some comparisons in general use partake of the humorous and satirical, as when one man is said to comport himself "like a bull in a china shop;" or another to be as busy "as a cat in a tripe shop;" or a gossiping woman is described as being "as cunning as Kate Mallet, and she was half a fool;" which last comparison, by the way, is a local one, and current only in Somersetshire. Another local comparison, current chiefly in the west of England, is, "as dry as a gyx," a phrase remarkably expressive to those who know what is meant by a gyx, but of little significance to those who do not. A gyx is the stalk of a creeping plant abounding in the western counties, which in early summer runs over the hedges and bank sides, and, withering under the heats of August, dries up so thoroughly that it will fall to pieces at a touch, and the pieces crumble into dust in the clenched hand.

Drunkenness seems to have given rise to several queer idioms of comparison. Such are, "as drunk as a lord," which may have had more truth in olden times than in our era of more respectable manners; "as drunk as a fiddler;" which is also a slander against a whole profession (though certainly they are in scenes of special temptation); and "as drunk as David's sow," a mysterious allusion, upon which we can throw no light, being altogether in the dark ourselves as to who David was (though of course he was a Welshman), and whether the sow or her owner was most to blame for the animal's lapse in good manners.

Some few comparisons there are, which, though they are current wherever our language is spoken, defy all attempts to get at their origin, and might puzzle Max Müller himself. Take, for example, "as queer as Dick's hatband." Who will tell us where this came from? Who was Dick, and what was the matter with his hatband? The phrase is very old, and has been in use for generations, and the mystery of its origin and of its supposed recondite significance has from time to time been the subject of persevering investigation by curious persons. But nothing very satisfactory has yet been discovered. It was suggested by one learned gentleman, who handled the subject from the historical point of view, that the Dick in question might have been the tyrant Richard III, and that the hatband was only a metaphorical expression for his kingly crown, which, at the crisis of Bosworth Field, was certainly in a state of jeopardy that might have been figuratively designated as "queer." But we cannot accept this ingenious solution of the difficulty, which strikes us as too learned and too far-fetched. To our thinking, Dick is more likely to have been some low-born hind, who, having "given his mind" to hatbands, signalled himself in some special manner, and thus transmitted his name to pos-

terity. There was a custom prevailing at the beginning of this century, though it is nearly obsolete now, of hiring farm servants at certain periodical gatherings, called "mops." The labourers who came to be hired used to intimate their calling by wearing certain insignia round their hats—a wisp of hay denoting a carter, a wisp of straw a thatcher, a plait of horsehair a ploughman, and so on; now, if the Dick of the queer hatband was a candidate for service on any such occasion, the circumstances that gave rise to his renown may be easily imagined.

"As mad as a hatter" is another mysterious comparison, which even people of education do not disdain to use, though no one is kind enough to vouchsafe an explanation of it. If it be assumed, as a friend suggests, that hatters must be mad to go on, from year to year, perpetrating the frightful cylinders that gentlemen wear on their heads, we feel bound to rebut, in their behalf, the charge of insanity, and to transfer it to the wearers of the said abominations instead of the makers, who only exercise their industry in satisfying the demands of the public.

The amount of pleasure implied in being "as jolly as a sand-boy" we cannot tell, never having belonged to that free-and-easy profession, the members of which, so far as our observation goes, pass a considerable portion of their time in the exhilarating and healthful exercise of assmanship (their empty sand-bags serving them as saddles), their jollity being most exuberantly demonstrative when their merchandise has been transmuted into cash.

"As merry as a grig," is also a frequent similitude, though we have never been able to get at the secret of the grig's merriment—a grig, as the reader may require to be informed, being a small eel which has not arrived at years of discretion, and manifests its lack of that virtue by perpetually wriggling and twisting its body and wagging its slimy tail.

But we must draw bit, lest we provoke somebody to a comparison which shall illustrate our tediousness.

THE WORKING BEE.

TOWARDS the end of March the workers embrace every opportunity to carry home "bee-bread"—the pollen or bloom-dust of flowers—as this is required as food for the young, which are now requiring much attention.

As the queen lays all the eggs that produce the three sorts of bees, everything depends upon her health and fecundity. In the height of the season the number of eggs laid in a single day amounts to several hundreds, and this for weeks together.

Reaumur states that a healthy queen will lay 12,000 eggs in twenty-four days. This may be rather a high figure. I once made a careful observation upon the increase of a good hive, with the following result:—

In the year 1844 I hived a swarm on the 22nd of May. The swarm consisted of 25,000 bees. On the 3rd of July, a maiden swarm (a swarm from a swarm) came off numbering about 20,500. On the 15th of July there was a second swarm of about 10,500 bees. Reckoning the bees still remaining in the hive, with those lost by death, at 9,000, we have a total of 40,000. From these take the original swarm of 25,000, and 15,000 will remain to be accounted for. These must have been hatched in thirty-three days, as could be easily shown; thus showing a figure nearly approaching Reaumur's high estimate of 500 a day.

During April the bees are not likely to do much to-

wards storing. They find work enough to "hold their own" and attend to the brood. I once had a hive that increased in weight fourteen pounds, from April 17th to 24th; but this is a very rare occurrence. Should a hive with a good healthy queen require feeding at this season, feed liberally.

About this time, a hive that is weak through the imperfections of the queen, is likely to suffer "a desertion." In this case the few remaining bees, accompanied by the queen, forsake the hive, leaving only the empty combs. It not unfrequently happens that this small and forlorn community enters another hive in the same apiary.

Towards the end of May, the drones having become numerous, and the hive nearly full of workers, "the musicians of the queen's band" find plenty to do, in fanning their wings to lower the temperature of the hive, and show their pleasure at the successful operations going on within.

The crowded state of the hive may now cause the bees to "swarm." Within the whole range of instinctive operations, what is more remarkable than a swarm of bees? Thousands of bees, that yesterday would have died in battle or starved themselves to death in defence of the tenderly-nursed brood, will to-day leave them all without the slightest hesitation, fully bent upon their "new move."

The bees that leave the hive before the queen, move off in a stately march, as if conscious that their choicest treasure remained behind. After the queen has left, the rush made by the rest of the swarm is remarkable. It is then all "who shall be first?" Whether the queen leaves the hive of her own accord, or whether she is compelled to do so by the workers, is a disputed point. I once saw the queen on the platform, and as she attempted to return to the hive, the workers forced her to take wing; but a solitary case proves nothing. The bees, if they like their new home, begin to work without delay.

On the 9th of July, 1859, I put a swarm of about 24,000 bees into a hive with the combs already made, and they stored a pound of honey the same afternoon.

Bees swarm at various times and seasons. I have had a swarm as early as the 30th of April, and as late as the 23rd of September. One has left the hive at 7.45 A.M.; another at 4.48 P.M. One swarm has consisted of no more than 5,600 bees; another could boast of an army of colonists, 27,000 strong.

Notwithstanding the decision of bee-writers to the contrary, I have had a good swarm two days before the appearance of drones; and I have also had a swarm that did not leave the parent stock till the drones had appeared sixty-five days.

Honey-collecting is about as much dependent upon the weather, as haymaking. I have known a nice swarm, after having improved every opportunity, starved to death at the end of three months; and I have had a swarm which collected five-and-a-half pounds of honey in one day, and at the end of five days had reached the weight of a good winter's stock.

Hundreds of times, including almost every possible variety of circumstance, I have weighed bees, and do not doubt but the result would surprise the apiarist as well as the general reader. For instance—The weather being hot, with a clear sky and calm air, a good hive increases in weight three pounds daily. The day following is equally hot, but thick clouds pass over the face of the sun every few minutes, and the increase in weight is only a quarter of a pound daily. But notwithstanding this, a clouded sky sometimes proves an advantage. A

striking instance of this kind happened in August, 1853, a hive dropping suddenly from three pounds a day increase to nothing, solely on account of the weather becoming very bright and drying. A bountiful honeydew being the chief source of supply, affords the explanation.

If you interrupt bees in their work they will accommodate themselves to circumstances in a most interesting manner. If you contract the hive, they will at once contract the size of the cells to meet the difficulty. If you break a piece of comb, and make it lean on one side, they at once throw across buttresses to keep it in position; I have made them do this, and almost given the "wise folk" credit for something beyond instinct.

The manner in which bees communicate their plans to each other is amongst the most noteworthy of their "doings." Place a piece of honeycomb or other tempting bait at the distance of ten or twelve yards from the apiary. A solitary bee shall first be attracted, and, having satisfied itself, shall return to the hive. From this hive, in a few seconds, the bees will come out in an excited manner and off to the newly-discovered treasure, whilst the bees in the other hives remain undisturbed till similarly enlightened by some member of their own community. I once hived a swarm, and shortly afterwards another swarm attempted to find a home in the same hive. The greater part of the second swarm clustered around the outside; and, fearing that the population would be too great, I tried to separate the swarms, and so far succeeded that they occupied two hives the remainder of the day. At night they were placed as two distinct swarms, with several hives of bees between them; early on the following morning the bees left one of the hives in a very matter-of-fact sort of manner, and I expected them to return to the parent stock, but was not a little surprised to find that they had discovered the whereabouts of the other swarm, which they soon joined without molestation.

The manner in which the workers treat the drones is interesting. In the economy of the bee nothing has puzzled naturalists more than the use of so many drones in the community. The highest number of drones in a hive is estimated at 2,000, but with my own hand, I have killed 2,800 in one family, and need hardly say that I failed to secure the whole brood. The drones live upon the fat of the land and are never satisfied with less than a plenty. They fly abroad in the hotter part of every fine day, and seem to enjoy their life of ease and pleasure as much as any human drones ever do. The workers are very fond of the drones as long as they feel their presence to be necessary. Towards the close of the honey-season the case alters, and the poor creatures are found to be in the way. First, they are treated with disrespect; but this is soon followed by more visible marks of displeasure. The workers begin their determined attack upon the drones by hunting them away from the open cells of honey, and forcing them into some corner of the hive where they can find no food. Sometimes, if the weather should prove unfavourable for getting abroad, the poor creatures remain in their barren position so long that they are unable to fly when the weather permits their going out. In such case (which is not common), they may be seen crawling upon the ground in front of the hive by hundreds. In fine weather, and owing to the strength of the drones, the workers (most of them being in the field) cannot confine them, and they keep leaving the hives and returning, to the sad annoyance of their foes. At length, the bees, losing all patience, resort to their stings, and then the poor drones fall an easy prey.

J. B.

Varieties.

ROYAL ACADEMY.—The works of art sent for exhibition this year amount to the unprecedented number of 3,011. The pictures alone amounted to 2,683. With closest packing, the number placed on the walls was 896, while of pictures "accepted but not hung" there were 180.—*Sir Francis Grant.*

SHAM WINES.—When consular agent at Rheims, I legalized many an invoice of "Madeira," "Sherry," "Port," "fine old Cognac," and the "best Holland Gin," and of all sorts of *liqueurs*, "Chartreuse," "Curaçon," and "Kirsch," exported to the United States from Epernay, by an expert manufacturer of that place. I had reason to believe that within his extensive premises he had brought together the vinous powers of production of the whole world, and could, without travelling beyond his own walls, summon at his call the rich cordial of the Alps, the fiery spirit of the Low Countries, the wine of the Cape, the *liqueur* of the Antilles, or the products of any other quarter of the globe. In fact, it is no secret in Champagne that this ingenious and wealthy manufacturer, whose success has been commensurate with his wondrous enterprise, has virtually abolished all the geographical divisions of the earth, and, recognising their diversity only in name and idea, produces within his own inclosure any wine, spirit, or *liqueur* a customer may demand. I know by name his agent in the United States, and I would no more think of drinking of his vari-coloured bottles than I would of those of an apothecary's shop.—*The Champagne Country*, by R. Tomes.

THE "CLIQUE" IN PARIS.—In Paris, the *clique* exists in all theatres, with the honourable exception of the Théâtre Italien. At the Grand Opéra, the present *chef de la clique*, M. David, is a man of importance and intelligence. He has a staff two hundred strong under his command. With cunning generalship he distributes his forces in batches of ten or twenty throughout the house. Each of these he places under the surveillance of trusty lieutenants—men of caution and of superior address. He occupies a conspicuous position himself, and conducts the applause with as much care and precision as the *chef d'orchestre* directs the music. . . . In most of the theatres the *clique* sit together, and occupy the centre of the pit. With a little practical experience you can pretty well tell which of the artists on the stage is liberal towards the *clique*, and which the reverse. On a first night, the *clique* is an object of interest to authors, actors, singers, and managers. The *chef* has long and serious interviews with the *impresario*, at which are discussed the different "points" that are to be distinguished, where the *clique* is to laugh loudly, or express approbation by an encouraging "bravo." Auguste, David's predecessor at the Opéra, insisted upon all first nights confided to his care being sustained *à la crescendo*. He used to declare it would never do to exhaust the influence of his efforts upon the first and second acts, but as the piece progressed so should the excitement of the *clique* increase, until the last act ended in the mad enthusiasm of his myrmidons.—*The Impresario.*

FRANZ BOPP.—Born at Mentz in 1791, the future Comparative Grammarian received the greater portion of his education at Aschaffenburg. He showed very early a desire to study languages, not for their literature alone or chiefly, but in order to understand their organism. For the prosecution of these studies he went to Paris in 1812, and consumed the next five years of his life in the acquisition of Sanskrit and reading largely in the great Sanskrit epics, especially the *Mahā-Bhārata*, from which he subsequently published several of the most interesting episodes, both in the original and in translations. In 1816 was published at Frankfurt a short treatise entitled, "On the System of Conjugation in Sanskrit, compared with that used in Greek, Latin, Persian, and German." Bopp removed from Paris and resided in London in 1817, where he published, in the "Annals of Oriental Literature," an elaborate article entitled, "Analytical Comparison of the Sanskrit, Greek, and Teutonic Languages, showing the Original Identity of their Grammatical Structure." It is said to have been partly through the credit gained by this paper that he was appointed, in 1821, to an Extraordinary Professorship of Oriental Literature and General Philology at the University of Berlin. This was elevated into an Ordinary Professorship in 1825, and held until his death. His life thenceforward was outwardly uneventful. The "Comparative Grammar" appeared in six parts in from 1833 to 1852. Bopp was a man of great gentleness and simplicity of character, devoted to his special studies, and taking no part in the world of politics. He died at the age of seventy-six, October 23, 1867.

OFF PORTSMOUTH.

JAMES BRAITHWAITE THE SUPERCARGO.

BY W. H. G. KINGSTON.

CHAPTER I.

"WHAT'S the name of the craft you want to get aboard, sir?" asked old Bob, the one-legged boatman, whose wherry I had hired to carry me out to Spithead.

"The Barbara," I answered, trying to look more at my ease than I felt; for the old fellow, besides having but one leg, had a black patch over the place where his right eye should have been, while his left arm was partially crippled; and his crew consisted of a mite of a boy

No. 862.—JULY 4, 1863.

whose activity and intelligence could scarcely make up for his want of size and strength. The ebb tide, too, was making strong out of Portsmouth harbour, and a fresh breeze was blowing in, creating a tumbling bubbling sea at the mouth; and vessels and boats of all sizes and rigs were dashing here and there, madly and without purpose it seemed to me, but at all events very likely to run down the low narrow craft in which I had ventured to embark. Now and then a man-of-war's boat, with half a dozen reckless midshipmen in her, who looked as if they would not have the slightest scruple in sailing over us, would pass within a few inches of the wherry;

E E

PRICE ONE PENNY.

now a ship's launch with a party of marines, pulling with uncertain strokes like a huge maimed centipede, would come right across our course and receive old Bob's no very complimentary remarks; next a boatful of men-of-war's men, liberty men returning from leave. There was no use saying anything to them, for there wasn't one, old Bob informed me, but what was "three sheets in the wind," or "half seas over," in other words, very drunk; still they managed to find their way and not to upset themselves, in a manner which surprised me. Scarcely were we clear of them than several lumbering dockyard lighters would come dashing by, going out with stores or powder to the fleet at Spithead.

Those were indeed busy times. Numerous ships of war were fitting out alongside the quays, their huge yards being swayed up, and guns and stores hoisted on board, gruff shouts, and cries, and whistles, and other strange sounds proceeding from them as we passed near. Others lay in the middle of the harbour, ready for sea, but waiting for their crews to be collected by the press-gangs on shore, and to be made up with captured smugglers, liberated gaol birds, and broken down persons from every grade of society. Altogether, what with transports, merchantmen, lighters, and other craft, it was no easy matter to beat out without getting athwart hawse of those at anchor, or being run down by the still greater number of small craft under weigh. Still it was an animated and exciting scene, and all told of active warfare.

On shore the bustle was still more apparent. Everybody was in movement. Yellow post-chaises conveying young captains of dashing frigates, or admirals' private secretaries, came whirling through the streets as if the fate of the nation depended on their speed. Officers of all grades, from post-captains with glittering epaulets to midshipmen with white patches on their collars and simple cockades in their hats, were hurrying, with looks of importance, through the streets. Large placards were everywhere posted up announcing the names of the ships requiring men, and the advantages to be obtained by joining them: plenty of prize-money and abundance of fighting, with consequent speedy promotion; while first lieutenants, and a choice band of old hands, were near by to win by persuasion those who were protected from being pressed. Jack tars, many with pigtails, and earrings in their ears, were rolling about the streets, their wives or sweethearts hanging at their elbows, dressed in the brightest of colours, huge bonnets decked with flaunting ribbons on their heads, and glittering brass chains, and other ornaments of glass on their necks and arms. As I drove down the High Street I had met a crowd surrounding a ship's gig on wheels. Some fifty seamen or more were dragging it along at a rapid rate, leaping and careering, laughing and cheering. In the stern sheets sat a well-known eccentric post-captain with the yoke lines in his hands, while he kept bending forward to give the time to his crew, who were arranged before him with oars outstretched, making believe to row, and grinning all the time in high glee from ear to ear. It was said that he was on his way to the Admiralty in London, the Lords Commissioners having for some irregularity prohibited him from leaving his ship except in his gig on duty. Whether he ever got to London I do not know.

On arriving at Portsmouth, I had gone to the Blue Posts, an inn of old renown, recommended by my brother Harry, who was then a midshipman, and who had lately sailed for the East India station. It was an inn more patronised by midshipmen and young lieutenants than

by post-captains and admirals. I had there expected to meet Captain Hassall, the commander of the *Barbara*, but was told that, as he was the master of a merchantman, he was more likely to have gone to the Keppel's Head, at Portsea. Thither I repaired, and found a note from him telling me to come off at once, and saying that he had had to return on board in a hurry, as he found that several of his men had no protection, and were very likely to be pressed, one man having already been taken by a press-gang, and that he was certain to inform against the others. Thus it was that I came to embark at the Common Hard at Portsea, and had to beat down the harbour.

"Do you think as how you'd know your ship when you sees her, sir?" asked old Bob, with a twinkle in his one eye, for he had discovered my very limited amount of nautical knowledge, I suspect. "It will be a tough job to find her, you see, among so many."

Now I had been on board very often as she lay alongside the quay in the Thames. I had seen all her cargo stowed, knew every bale and package and case; I had attended to the fitting up of my own cabin, and was indeed intimately acquainted with every part of her interior. But her outside—that was a very different matter, I began to suspect. I saw floating on the sea, far out in the distance, the misty outlines of a hundred or more big ships; indeed, the whole space between Portsmouth and the little fishing village of Ryde seemed covered with shipping, and my heart sank within me at the thought of having to pick out the *Barbara* among them.

The evening was drawing on and the weather did not look pleasant, still I must make the attempt. The convoy was expected to sail immediately, and the interests of my employers, Garrard, Janrin, and Company, would be sacrificed should the sailing of the ship be delayed by my neglect. These thoughts passed rapidly through my mind and made me reply boldly, "We must go on, at all events. Time enough to find her out when we get there."

We were at that time near the mouth of the harbour, with Haslar Hospital seen over a low sandbank, and some odd-looking sea-marks on one side, and Southsea beach and the fortifications of Portsmouth, with a church tower and the houses of the town beyond. A line of redoubts and Southsea Castle appeared, extending farther southward, while the smooth chalk-formed heights of Portsmouth rose in the distance. As a person suddenly deprived of sight recollects with especial clearness the last objects he has beheld, so this scene was indelibly impressed on my mind, as it was the last near view I was destined to have of old England for many a long day. For the same reason I took a greater interest in old Bob and his boy Jerry than I might otherwise have done. They formed the last human link of the chain which connected me with my native land. Bob had agreed to take my letters back, announcing my safe arrival on board—that is to say, should I ever get there. My firm reply, added to the promise of another five shillings for the trouble he might have, raised me again in his opinion, and he became very communicative.

We tacked close to a buoy off Southsea beach. "Ay, sir, there was a pretty blaze just here not many years ago," he remarked. "Now I mind it was in '95—that's the year my poor girl Betty died—the mother of Jerry there. You've heard talk of the *Boyne*—a fine ship she was, of ninety-eight guns. While she, with the rest of the fleet, was at anchor at Spithead, one morning a fire broke out in the admiral's cabin, and though officers and men did their best to extinguish it,

some how or other it got the upper hand of them all; but the boats from the other ships took most of them off, though some ten poor fellows perished, they say. One bad part of the business was, that the guns were all loaded and shotted, and as the fire got to them they went off, some of the shots reaching Stokes Bay, out there beyond Haslar, and others falling among the shipping. Two poor fellows aboard the *Queen Charlotte* were killed, and another wounded, though she and the other ships got under weigh to escape mischief. At about half-past one she burnt from her cables, and came slowly drifting in here till she took the ground. She burnt on till near six in the morning, when the fire reached the magazine, and up she blew with an awful explosion. We knew well enough that the moment would come, and it was a curious feeling we had waiting for it. Up went the blazing masts and beams and planks, and came scattering down far and wide, hissing into the water; and when we looked again after all was over, not a timber was to be seen."

Bob also pointed out the spot where nearly a century before the *Edgar* had blown up, and every soul in her had perished, and also where the *Royal George* and the brave Admiral *Kempensfeldt*, with eight hundred men, had gone down several years before the destruction of the *Boyne*. "Ay, sir, to my mind it's sad to think that the sea should swallow up so many fine fellows as she does every year, and yet we couldn't very well do without her, so I suppose it's all right. Mind your head-sheets, Jerry, or she'll not come about in this bobble," he observed, as we were about to tack round the buoy.

Having kept well to the eastward, we were now laying up to windward of the fleet. There were line-of-battle ships and frigates and corvettes, and huge Indiamen as big-looking as many line-of-battle ships, and large transports, and numberless merchantmen, ships and barques, and brigs, and schooners; but as to what the *Barbara* was like I had not an idea. I fixed on one of the largest of the Indiamen, but when I told old Bob the tonnage of the *Barbara* he laughed, and said she was 't half the size of the ship I pointed out.

It was getting darkish and coming on to blow pretty fresh, and how to find my ship among the hundred or more at anchor, I could not possibly tell.

"Well, I thought from your look and the way you hailed me, that you was a seafaring gentleman, and on course you'd ha' known your own ship," said old Bob, with a wink of his one eye. "Howsomever, we can beat about among the fleet till it's dark, and then back to Portsmouth; and then, do ye see, sir, we can come out to-morrow morning by daylight and try again. May be we shall have better luck. The convoy is sure not to sail in the night, and the tide won't serve till ten o'clock at earliest."

"This comes of dressing in nautical style, and assuming airs foreign to me," I thought to myself, though I could not help fancying that there was some quiet irony in the old man's tone. His plan did not at all suit my notions. I was already beginning to feel very uncomfortable, bobbing and tossing about among the ships; and I expected to be completely upset, unless I could speedily put my foot on something more stable than the cockleshell, or rather bean-pod, of a boat in which I sat. I began to be conscious, indeed, that I must be looking like anything but "a seafaring gentleman."

"But we *must* find her," I exclaimed, with some little impetuosity; "it will never do to be going back, and I know she's here."

"So the old woman said as was looking for her needle in the bundle of hay," observed old Bob, with provoking

placidity. "On course she is, and we is looking for her; but it's quite a different thing whether we finds her or not, 'specially when it gets dark; and if, as I suspects, it comes on to blow freshish, ther'll be a pretty bobble of a sea here at the turn of the tide. To be sure, we may stand over to Ryde and haul the boat up there for the night. There's a pretty decentish public on the beach, the Pilot's Home, where you may get a bed, and Jerry and I always sleeps under the wherry. That's the only other thing for you to do, sir, that I sees on."

Though very unwilling to forego the comforts of my cabin and the society of Captain Hassall, I agreed to old Bob's proposal, provided the *Barbara* was not soon to be found. We sailed about among the fleet for some time, hailing one ship after another, but mine could not be found. I began to suspect at last that old Bob did not wish to find her, but had his eye on another day's work, and pay in proportion, as he might certainly consider that he had me in his power, and could demand what he chose. I was on the point of giving up the search, when, as we were near one of the large Indiamen I have mentioned, a vessel running past compelled us to go close alongside. An officer was standing on the accommodation-ladder, assisting up some passengers. He hailed one of the people in the boat about some luggage. I knew the voice, and, looking more narrowly, I recognised, I thought, my old schoolfellow Jack Newall. I called him by name, "Who's that?" he exclaimed. "What, Braithwaite, my fine fellow, what brings you out here?"

When I told him, "It is ten chances to one that you pick her out to-night," he answered. "But come aboard; I can find you a berth, and to-morrow morning you can continue your search. Depend on it, your ship forms one of our convoy, so that she will not sail without you."

I was too glad to accept Jack Newall's offer. Old Bob looked rather disappointed at finding me snatched from his grasp, and volunteered to come back early in the morning, and take me on board the *Barbara*, promising in the meantime to find her out.

The sudden change from the little boat tumbling about in the dark to the Indiaman's well-lighted cuddy, glittering with plate and glass, into which my friend introduced me—filled, moreover, as it was, with well-dressed ladies and gentlemen—was very startling. She was the well-known *Cuffnells*, a ship of twelve hundred tons, one of the finest of her class, and, curiously enough, was the very one which two voyages before had carried my brother Frederick out to India.

I had never before been on board an Indiaman. Everything about her seemed grand and ponderous, and gave me the idea of strength and stability. If she was to meet with any disaster, it would not be for want of being well found. The captain remembered my brother, and was very civil to me; and several other people knew my family, so that I spent a most pleasant evening on board, in the society of the nabobs and military officers, and the ladies who had husbands and those who had not, but fully expected to get them at the end of the voyage, and the young cadets and writers, and others who usually formed the complement of an Indiaman's passengers in those days. Everything seemed done in princely style on board her. She had a crew of a hundred men, a captain, and four officers, mates, a surgeon, and purser; besides midshipmen, a boatswain, carpenter, and other petty officers. I was invited to come on board whenever there was an opportunity during the voyage.

"We are not cramped, you see," observed Newall, casting his eye over the spacious decks, "so you will not crowd us; and if you cannot bring us news, we can exchange ideas."

True to his word, old Bob came alongside the next morning, and told me that he had found out the *Barbara*, and would put me on board in good time for breakfast.

I found Captain Hassall very anxious at my non-appearance, and on the point of sending the second officer on shore to look for me, as it was expected that the *convoy* would sail at noon; indeed, the *Active* frigate, which was to *convoy* us, had *Blue Peter* flying at her mast-head, as had all the merchantmen.

"You'd have time to take a cruise about the fleet, and I'll spin you no end of yarns, if you like to come, sir," said old Bob, with a twinkle in his eye, as his wherry was see-sawing alongside in a manner most uncomfortable to a landsman.

"No, thank you, Bob, I must hear the end of your yarns when I come back again to old England; I'll not forget you, depend on it."

Captain Hassall had not recovered his equanimity of temper, which had been sorely ruffled at having had two of his best men taken off by a press-gang. He had arrived on board in time to save two more who would otherwise also have been taken. He inveighed strongly against the system, and declared that if it was continued he would give up England and go over to the United States. It certainly created a very bad feeling both among officers and men in the merchant service. While we were talking, the frigate which was to *convoy* us loosed her topsails and fired a gun, followed soon after by another, as a signal to weigh. The merchantmen at once began to make sail, not so quick an operation as on board the man-of-war. The pipe played cheerily, round went the capstan, and in short time we, with fully fifty other vessels, many of them first-class Indiamen, with a fair breeze, were standing down channel; the sky bright, the sea blue, while their white sails, towering upwards to the heavens, shone in the sunbeams like pillars of snow.

The *Barbara* proved herself a fast sailer, and could easily keep up with our active protector, which kept sailing round the majestic-looking but slow moving Indiamen, as if to urge them on, as the shepherd's dog does his flock. We hove to off Falmouth, that other vessels might join company. Altogether, we formed a numerous *convoy*—some bound to the Cape of Good Hope, others to different parts of India—two or three to our lately-established settlements in New South Wales, and several more to China.

I will not dwell on my feelings as we took our departure from the land, the Lizard lights bearing N. half E. I had a good many friends to care for me, and one for whom I had more than friendship. We had magnificent weather and plenty of time to get the ship into order; indeed I, with others who had never been to sea, began to entertain the notion that we were to glide on as smoothly as we were then doing during the whole voyage. We were to be disagreeably undeceived. A gale sprang up with little warning about midnight, and hove us almost on our beam ends; and though we righted with the loss only of a spar or two, we were tumbled about in a manner subversive of all comfort, to say the least of it.

When morning broke, the hitherto trim and well-behaved fleet were scattered in all directions, and several within sight received some damage or other. The wind fell as quickly as it had risen, and during the day the vessels kept returning to their proper stations in the

convoy. When night came on several were still absent, but were seen approaching in the distance. Our third mate had been aloft for some time, and when he came into the cabin he remarked that he had counted more sail in the horizon than there were missing vessels. Some of the party were inclined to laugh at him, and inquired what sort of craft he supposed they were, phantom ships or enemy's cruisers?

"I'll tell you what, gentlemen, I think that they are very probably the latter," said the captain. "I have known strange things happen: vessels cut out at night from the midst of a large *convoy*, others pillaged and the crews and passengers murdered, thrown overboard, or carried off. We shall be on our guard, and have our guns loaded, and if any gentry of this sort attempt to play their tricks on us they will find that they have caught a Tartar."

MOTHER'S WORK;

OR, THE EDUCATION OF THE HEART.

BY MRS. ELLIS, AUTHOR OF "THE WOMEN OF ENGLAND."

CHAPTER I.—SELFISHNESS, PITY, AND GRATITUDE.

Who are the real educators of the young? If by education we mean only teaching, this question would not be difficult to answer. But if by educating we mean that preparing of the entire human being for what it has to be, and what it has to do, throughout the whole of its probable life from childhood to old age, then the question assumes a different aspect, and we wait, almost in vain, for an answer when we ask who really educate the young?

In the hope of getting rid of some portion of the responsibility which arises out of this question when fairly and conscientiously put, we sometimes say, "There is the education of circumstance, which goes a long way towards the formation of character." But who selects or controls the circumstances by which the young are influenced in very early life?

Of course we should be told by ninety-nine persons out of a hundred, who might hear the question—"Who does educate the young?" that our public schools and colleges do this; and these institutions being for the most part in the hands of men who have themselves been educated in the same manner, we come to a certain round of question and answer, cause and effect, which has neither beginning nor end, and which consequently admits of no further inquiry as to whether education itself can be altered or improved.

This, however, is not the most enlightened way of looking at the subject, and certainly it is not the most encouraging, because it admits no hope of change. And yet education, above all other things, ought to admit of change—of constant and great improvement. Of all our social institutions education ought to be least governed by routine; because, unless adapted to the rapidly changing character of society, it can be no fit preparation for what the individual who is educated has to be and to do in the progress of life. Of all our provisions for the future, education has most need of adaptation not only to things as they are, but as we would have them to be, and hope they will be.

The application of the question already asked shows us at once the fallacy of making education a mere system of routine. But even if we should hold by this system so far as to choose for the teachers of a school only such masters as had themselves been taught in the same, it is impossible but that the young under their care should receive some bias of character incidental

to the changes continually taking place in society, and which would render the routine-system of the school inapplicable to their requirements as active and progressive members of such society.

It is impossible for this reason—because the mother is at work long before the master takes possession of the child. The nurse, too, is at work; home influences are at work; the education of circumstance has been busy with the child, and hence impressions have been made, and a bias of character has been imparted, such as no after education will in all probability be able entirely to obliterate or set aside. This may be for good or for evil, but it will certainly be there; and it will remain with the child all the more tenaciously, because it will have reached and affected those portions of his character which are not reached or affected by the teaching of schools.

To use a familiar figure by which this subject seems to be best understood—the school will deal with the child's *head*—the mother will have dealt with its *heart*. Neither head nor heart, however, can be dealt with quite separately. Both will mature as the child grows up to man or womanhood. As the nurse, while endeavouring to perfect her infant charge in the art of walking, does not forbid but encourages, though it may be indirectly, the use of its hands, so the school teacher, while bent upon exciting the intellect of his pupil, loading his memory, and quickening his powers of calculation, has beside him all the while a little beating heart which is learning to beat time to influences which he may unconsciously have set in motion. Or in the case of a mother bent only upon cultivating the affections of her child, so she also, by a system unknown to herself, may be leading on its opening mind to embrace either truth or falsehood in the region of intellect.

The question next arises, which is most important in the after development of the human being—the head, or the heart? Out of the head comes capability—out of the heart, motive. Human life is so constituted, human duty so appointed, that we need both; but a very slight acquaintance with education as generally conducted is sufficient to show us that the heart bears no comparison with the head in the amount of regard bestowed upon its cultivation. In other words, the moral bears no comparison with the intellectual. Capability is the one great object of attainment. Motive is, for the most part, left to take care of itself.

Such being the case with school education—and if we require proof that it is so, we need only glance over a few pages of those advertisements of school books, teachers, assistants, &c., which appear in our public papers, chiefly about midsummer and Christmas,—such being the case with school education, the responsibility of parental or home education becomes all the more serious as regards the heart of the child; especially when we bear in mind that out of the heart come motive, desire, love, hate—all that makes us morally, what we are as agents of good or evil, and religiously, what we are as believers in the word God, and doers of his will.

Parental education in our present social condition must almost necessarily be of a very one-sided description. What can the father, who is a man of business in many cases, know of his children, or what can he do for them? He may see them now and then, but his intercourse with them must be extremely limited, and his acquaintance with their hearts and their motives must be partial in the extreme. Besides the shortness of the periods during which the father is associated with his children, there is this great disadvantage operating against his influence over them—that children do not

develop at any given moment, or on compulsion: They open their little hearts, and disclose the treasures of their understandings just when the fit is upon them, and often at the most unsuitable times for receiving the benefit of a father's instruction. Not unfrequently, when the child is lying down to sleep, it will perplex its ignorant nurse with a question so decisive in its moral tendency, that the father who does not hear it—perhaps the mother too—can scarcely measure the amount of loss which that child sustains by not having them to answer it.

Such moments of curious and intelligent inquiry often occur to the child when walking out in the country with its nurse; and these are the times when the providential care of a heavenly Father, and the wonders of his creation, may be begun to be unfolded to the inquirer in a simple, familiar, but always a true way with surprising benefit; when a kindly interest may be excited in the animal world, and a love awakened for the beauty which may be seen in flowers, or leaves, or any of those near objects which fall under the observation of a child. These golden opportunities are for the most part left entirely to the nurse, and how nurses in general are prepared for turning them to the best account, is a matter requiring no comment here.

After all, and in whatever light we regard this subject, we are compelled to go back to the mother for a large amount of that education which really forms the character of the man or the woman. It is not, and it cannot be, entirely the work of schools, although many parents think it can; and some are not very tolerant towards those schools which fail to effect at sixteen what should have been done at six. To the mother we must go back, not as really the more responsible agent, but as the only one whom the usages of society appear to have left at liberty for the discharge of the full amount of parental duty; and perhaps the mother also might say, were the question put to her, that the usages of society had not left even to her the time or the means for discharging these duties aright.

With the question of duty, or the choice of duties, where the number is so great that one must be done, and another left undone, I presume not to meddle. This is a point on which individuals must exercise their own judgment. I am only supposing there may be mothers who do take this duty up themselves, and laying it seriously and thoughtfully to heart, do desire to learn whatever can be learned in relation to the right performance of this particular duty. Even here there can be no specific rule laid down by the wisest amongst us. With all our boasted attainments in knowledge and capability, so little is really known as regards the education of character that help can only be looked for from those who have carefully thought the matter out, and feelingly laid up in store for practical use, whatever has been discovered in the way of serviceable truth. Such help may sometimes come from unexpected sources, and it may present itself in a very humble form. The more simple the better for the experimental purposes of ordinary life.

Under the conviction that help of this kind—especially help in the cultivation of the heart, with all its motives, desires, and moral tendencies—is more needed in the present day than any other kind of help, I have ventured to put together a few thoughts, the result of much thinking on this important subject, hoping that they may possibly be useful to some who are just feeling that way which mothers have to tread, bearing at first their precious charge along with them, and then consigning it to an unknown future, through which all must in one sense walk alone.

Perplexed, as all writers appear to be, with the profound and complicated nature of the subject, I have determined to treat it almost as a child would; and with this view before me, I shall continually speak as in common parlance of the head, and the heart, although the latter will be almost entirely the subject of my remarks, not only as being most within the range of my own observation and means of understanding—not only as being most interesting in itself, at least to me, but as being most neglected in our systems of education. Of the heart, then, as being the centre from whence spring motive and desire, I propose to speak as the source of that which is most needed for the correcting of those evils which press heavily against our social prosperity, and for the establishment of a purer moral sense, and a higher moral tone throughout our social relations.

There are few mothers—so few that we scarcely call the exceptions *human*—who do not care for the little helpless infant body. God has given them this natural spring of maternal tenderness and solicitude, in common with the lower animals; but though so common as to be called an instinct, we can never regard this unselfish, unsparing devotedness of the mother in any other light than as one of the purest and most beautiful of all the provisions of a kind Providence, ordained for purposes of preservation and enjoyment.

All that has to be done with the infant beyond the care of its body has been left by the wisdom of the great Creator to be cared for and provided by the higher faculties of the human parent, which faculties are possessed by man alone as an intelligent, responsible, and immortal being. Herein consists the great difference between man and the lower animals, as well as between human beings in a cultivated and enlightened condition, and those who have never learned the great fact of their own responsibility as intelligent and immortal beings.

Of the little helpless body in the first stages of its existence, there is no need to write. But soon the germs of thought begin to manifest themselves, and then, just as the nurse would teach the child in its first attempts to walk, how to step truly, fairly, uprightly, so an equal amount of pains should be taken to teach the child how to think truly, fairly, and with upright purpose of heart.

Those who regard education as beginning only with the learning of the alphabet, and think it is carried on only by the teaching of direct lessons from books, or masters, will be astonished to find, as they may by actual experiment, how much of the work of true education may be done before the child is able to read a single word. It is, indeed, a melancholy mistake to teach reading before thinking. Words, mere words, without a body of sense or meaning in them, are worse than dull. They are wearisome in the extreme; but when the child has a little thought to put into every word which it is learning to spell, or when from the act of thinking it is able to find the appropriate place for any more insignificant word as a help in the expression of thought, the case is materially altered, and the child may be led on, dressing thoughts in words with something like the pleasure which is felt in dressing a doll.

But the question of paramount importance to the human parents is, what they desire that their child should be prepared to be and to do in after life; or in other words, what are the principal lessons which the child must learn in order rightly to fill a place of social and religious relationship both to God and man.

One of the great social lessons necessary for the right filling of this place as embodied in the golden rule is

this, to do to others as we would that they should do to us, and to love our neighbour as ourselves. How is this, perhaps the most difficult of Christian lessons, to be taught in early childhood? Why, the little child itself is a perfect bundle of selfishness—eating and drinking, grasping and getting, always ready to scratch the face, or tear the hair, of either mother or nurse if they are not quick enough in supplying its wants, or if they refuse to supply them.

Unlovely as this picture may appear, and unamiable as selfishness always looks, we must not broadly find fault with it. Self-love is implanted in the nature of the child, as in that of the whole animal creation, for purposes of self-preservation. It is the gift of God, and it is perfectly right at first that the little child should love itself, and grasp and get what it can; but it is no less necessary, because of this, that the time should be narrowly watched when it will be no longer right for the child to be governed by self-love, when a new law of existence must be established, and the old law modified, brought under, and made subservient to the new.

Many people in other respects wise, and many who are both wise and good, talk of the necessity for this selfishness being entirely rooted out, as if such a thing were possible. No; it is a portion of the elementary nature of the human being, originally, perhaps, a little stronger in some than in others. The way to manage this, as well as many other tendencies inherent in the nature of the child, is to call up and bring against it a counteracting power, to bring into operation the law of kindness, to establish habits of consideration, love, and even pity for others; above all, to excite in the yet tender and susceptible feelings of the child a sense of satisfaction and delight in making others happy, in alleviating their pain when they suffer, and in sharing with them whatever brings enjoyment, so that no pleasure shall to them be perfect if experienced alone.

To make the child avowedly the dispenser of actual good to others, while yet in its infancy, may prove to be only transferring its original selfishness from the thing enjoyed to the open, and often ostentatious act of giving. This is scarcely a likely method for bringing about the desired result. It would, I think, tend more to promote this end to be a little chary as regards the reality of infant property.

Love of property is one part, and a very useful one, of that original selfishness which it is so necessary that education should teach how to regulate and hold in subjection. A love of property, in other words, a desire to obtain and possess, is one of the most active tendencies of our nature. It is the stimulus of industry, and the lawful object of honest work, while it gives stability to national and individual prosperity. And yet this natural tendency may be so ill-regulated as to be greediness in childhood, and covetousness in old age.

A love of property is generally considered so harmless in a child that it is encouraged rather than controlled. But surely it would be wiser, as well as more in accordance with truth, to bring up a child with the idea that almost all which it enjoys is lent or given to it by others, and that very little is really its own. Out of that little, not out of other people's property, should come the gifts of the child; the constant sharing with others of all which it most enjoys, not being enforced as a painful duty, but permitted as a privilege, without which no good thing would be either truly good or sweet.

There are parents who conscientiously make their children always pick off a little crumb from their cake for the mother, the nurse, or perhaps the elder sister, who has conscientiously received the crumb into their

mouths with many grimaces, indicating the immense value and magnitude of the gift, while the little hero, who has conferred this vast benefit, sits down with satisfaction, and gobbles up his huge slice of cake. This is considered to be making the child generous; but alas! how little is this generosity like that which will be required of him afterwards, perhaps at some heart-rending sacrifice, before he can be a truly generous man.

I know of nothing more likely to produce the effect desired with regard to property than the making of an equal distribution, wherever this can be done. The child, I think, should give as much as he takes himself, just as we are required to do in after life by good manners and good feeling. And here would be another useful lesson, that of teaching the child to share the common lot without complaining, than which there are few lessons more desirable to be learned in early life, few more difficult to learn for the first time in mature age.

The sentiments which most effectually oppose, control, and overweigh our natural selfishness are chiefly pity and gratitude; I would say love, and that pre-eminently, only that love assumes so many characters, and some of them very selfish ones. It is quite possible to love one or more individuals, perhaps one's whole family, in a greedy, absorbing, and exclusive manner. But if we can bring ourselves to understand love as charity, then we accept that noble definition given us by the Apostle Paul, and we see how beautifully this sentiment embraces all that is generous, compassionate, forbearing, and kind.

Love is also a feeling somewhat difficult to expand in the infant heart. A little child is always a partizan, its love intensely personal. The more it loves one individual, or even two, or three, the more it seems disposed to resist or repel all others who might by implication stand in the ranks of opposition. The love of a little child is naturally like the small rill gushing out from the mountain's side, clear and pure, but necessarily single and narrow in its course. It requires the swell of the broad river to embrace the plain from hill to hill, and so to fertilize vast tracts of cornfield and meadow.

But pity is a different matter to deal with. It may be awakened at any time and applied to all cases of suffering. It cannot, like love, be classed amongst our spontaneous emotions. Indeed, it seems rather a melancholy fact to acknowledge, but experience amply confirms the remark of Dr. Johnson, that pity has to be taught, and that children are not naturally compassionate. Here, then, is a beautiful piece of work for the mother. Her child may not be compassionate, judging strictly by outward manifestation; but yet in that little heart, which it is her peculiar province to understand, and educate, she will find, far down perhaps in its delicate recesses, the tender threads of pity which it will be her happy and holy task to draw out, and attach to every form of suffering which life presents.

So beautiful is the development of pity on the part of a child, that there is danger from an opposite direction, lest it should be made a luxury, and so degenerate into morbid sensibility to pain. But of the two extremes that of not caring at all for the sufferings of others is so much more objectionable, that there can be little hesitation as to which of the two it would upon the whole be safest to risk; and in this, as well as in all other cases of stimulated faculty, either in feeling or understanding, such extremes will have to be guarded against by the judicious care of those who engage in the great work of education.

Seldom is the sentiment of pity awakened without the accompaniment of a desire to relieve, to help, or to defend. It is delightful to think what the Author of our being has done for us in this way, if we would but accept his gifts, and use them aright for the good of our fellow creatures, and for his glory. Here we see that no sooner is the emotion of pity deeply stirred, than there follows an impulse to help. It is true the little child, always a partizan, will often manifest a desire to defend, nay, even to avenge by doing battle against some supposed enemy to whom the pain or the sorrow which awakens its pity is attributed; and there is no limit to the wrath or indignation which, on such occasions, the child will sometimes manifest. All this emotion the mother has to lay hold of, and turn into channels of help.

Thus we see that, by the instrumentality of the mother's hand, guided by that nice discrimination and tact which God has given her for the purpose of understanding and educating the heart of her child, those emotions, even the wildest, which would naturally burst forth into explosive passion, and perhaps destructive action, may be turned by her gentle care into peaceful and health-giving channels, bearing ever as they flow balm to the wounded, help to the feeble, and comfort to the sorrowing.

If pity may thus be used as the great corrective of natural selfishness, gratitude is scarcely less effective in producing the same happy results. And yet it is wonderful how little pains are taken to inspire in children the feeling of gratitude. True, there is this difficulty in the way of inspiring gratitude—a little child does not know, and really cannot understand, how much is done and suffered in its service. It can make no calculation of the nights rendered sleepless by its wailings—of the care, the anxiety, the self-denial, and labour by which its thousand wants are supplied. It is impossible that it should form any estimate of these; but so far as it can understand, it is most important that the sentiment of gratitude should be awakened and maintained with the most assiduous care.

This is the more necessary, because, as regards its natural selfishness, the poor little child stands at a great disadvantage. It has everything against it in being constantly ministered to by others. Gifts are poured into its lap by those who look delighted to give. It sits like a king, receiving all. How should it be otherwise than selfish? How indeed, unless the mother will help to influence the heart of her child—that centre out of which will spring all motive for the actions of its future life.

Let gratitude then be the great work of the mother to foster and deepen. A sense of *indebtedness* on the part of the child will help in this work; and as children are always personal in the exercise of their sentiments, it is good to keep them in mind of the individual benefactors to whom they owe this or that indulgence, or to whom they are indebted for the possession of their toys, books, or any other article of infant property. In this way the memory of the child may be exercised with benefit, both to that and the heart, even at a very early age.

It would not be easy to estimate the vast, the almost incalculable difference morally, and under religious teaching, of a child in whom the sentiment of gratitude is genuine and deep, and one who has never been taught to pour out its best and sweetest feelings through this channel. It is pitiful to think of the loss which a human being sustains by not being heartily and habitually grateful. Those who are so know that no feeling,

in the whole range of human experience, brings with it more genuine pleasure than that of heartfelt gratitude. Where this feeling has not been fostered in early youth, or where it exists only in a meagre, half-starved form, the grudging acknowledgment of kindness received is sometimes a hard and painful duty. How different that generous outburst from a grateful heart, which diffuses even more happiness than it receives!

After all, these teachings of the young heart are but preparatory to the work of the great Teacher. And yet these first stirrings of sentiment and feeling are the germs of great principles. They are stirrings of those motives which will animate the active life of the true being; and they are such as that being will be called to exercise in the highest range of Christian experience. Pity and gratitude—the one to help in all the sufferings of this mortal life, the very motive which brought the Saviour down to earth; the other embracing that vast debt which we owe to Him, and sweetening and sanctifying every duty, however small, which we try to render in return.

TWO MONTHS IN SPAIN.

BY THE AUTHOR OF "A MERCHANT'S HOLIDAY."

VI.—GRANADA.

THE VERMILLION TOWER IN THE ALHAMBRA.

The reader will observe that I made rather a circuitous journey to get to Granada. There is a route by which I might have reached this city direct from Cordova, by striking off from the main line at Alameda, and by diligence to Loja, and thence by rail to Granada.

This route, to a person unacquainted with the language, presents some difficulties, as happened to some of my friends who went by it. They were too late for the train, and had to remain at a wretched Fonda in Loja for the night, which made the journey of about seventy miles occupy the greater part of two days. I think it better, though at a trifling additional expense, to make Malaga the head-quarters; leave one's luggage, and start light-handed to Granada.

The previous evening, at the *table d'hôte*, I arranged to join two English tourists, one of whom had a "courier" (half Spanish and half Basque), who spoke indifferently four or five languages—an excellent guide, and kind-hearted, obliging fellow. We left Malaga at 6 A.M. by rail through the mountain range, the wildness and grandeur of which rather increased with familiarity. We got out at the station near Antequera, one of the old Spanish towns, where the habits and customs of the half-Moorish peasantry are still retained.

The readers of Washington Irving's romantic history of the "Conquest of Granada," will remember the prominent position this ancient Roman and Arabic city held in the history of Spain at that period. Here the "flower of Spanish chivalry" assembled in 1484, to wreak their vengeance on the Moors for the disasters of the preceding year, "and to lay waste the kingdom of Granada," which they did "like a stream of lava spreading over these fine and fertile regions." So effectually did these "brave cavaliers" carry out their cruel purpose, that they have left their mark on this desolate tract to the present day. The town, which contains about 20,000 inhabitants, is finely situated on the face of the hills, and looks well at a distance, with its white-washed walls and old castle on the height; but miserable and dilapidated within. Here a diligence was waiting us, yoked with five pairs of mules, harnessed with scraps of leather and ends of rope—both cattle and equipage presenting a very rickety appearance. The driver was rather an agreeable, jolly fellow, and perfectly "master of the occasion." We had two other attendants, —a postilion on the first mule, and a man who ran by the side of the diligence to tie up anything that might require adjustment. These two men in dress (or rather, I should say, in rags) and appearance had a half-savage look, that reminded one of their Arab origin; and yet their looks belied them, for we found them kind and inoffensive. Eight uncomfortable mortals were crammed into the interior of this packing-case—a compromise between a small omnibus and the old diligence—and for five hours were jolted and shaken through ruts and over boulders, the unpleasantness of which could only be equalled by a ride on the hump of a hard trotting dromedary. In some parts there was scarcely an apology for a road. The roads in Spain at present remind me of the description we have of those in Great Britain two centuries ago, or even as late as 1745, when the King's army took so long to advance towards Derby, and could scarcely bring their artillery through the fields and unmade roads. In this and some other respects, Spain is much in the same position now that Great Britain was in the time of the first and second Charles, quite 150 or 200 years behind the rest of Europe in all that tends to comfort and progress. The country through which we passed is a succession of broken, dry, sandy-looking hills and rich fertile plains. We had only one change of cattle, at the town of Archidona, one of the worst I have seen in Spain for misery and wretched poverty, where men are driven to robbery from downright starvation.

As soon as we got out of our packing-case, and before

we could "shake ourselves out," we were surrounded by at least a hundred and fifty beggars of all ages: from the ragged, starved child, to the old, blind, and diseased. Their importunity amounted almost to an attack on the person; they would take no denial. The Spaniards make a little charity go a long way, and a farthing with a kind word was received with grateful blessings. The silver real of the English was simply a tribute on

I am, I would strip every altar, and even the priests of their rich sacerdotal robes, for such a purpose. They are always preaching up the virtue of charity and good works, till they have made pauperism an institution of holy pride and honour, rather than

THE ALHAMBRA, WITH DISTANT VIEW OF THE PALACE OF THE GENERALIFE.

the stranger, and it was a source of pain and sorrow that one could do so little for them. There is no sham or imposture in this mendicancy. We found on inquiry that there was little employment for the people, and those who had work were getting two reals, that is, fivepence a day, perhaps to provide for a family of five or six persons. The marvel is how they can exist, even with their few wants and beautiful and luxuriant climate. I remember, while visiting the cathedral at Seville, a poor old woman, superior in dress and appearance to most of the beggars who infest that building, came up and solicited alms in a most pitiful strain. Before assisting her, I inquired of my guide if he knew anything of this woman, and he told me that her husband had been for some years a clerk in a Spanish house in London; that he was the best linguist in Seville, and had for many years acted as guide and interpreter to foreign noblemen and gentlemen; that her son had been studying for the law, when both father and son had been carried off by cholera, and the widow left destitute. There was no provision for such persons but to solicit alms. We were just then looking at the image of the Virgin, which, as I have already mentioned, is said to be decorated with some £60,000 worth of jewelry. I remarked that the value of these useless jewels round the neck of that wooden doll would endow an asylum for twenty or thirty of these respectable poor. My guide replied, "Yes, Catholic as

shame and degradation." I should mention here that the man was not quite correct. There are charitable institutions into which these poor women might have got admission; but they say, "Why should we go into an asylum to be starved, and suffer a lingering death, when we can get food and health in the open air?" particularly as there is no shame attached to such a life. A

sturdy beggar came to an English friend's door soliciting alms. My friend offered him a job for a few hours. "What will you give me?" was his inquiry. A sum was mentioned. The beggar turned on his heel, saying he could make more than that on the street. The municipality know this well, and try to put it down; but while the practice is encouraged and fostered by the priests, under the cloak of "pious works," there is no hope of reform.

After five hours' drive over these trackless roads, we arrived at Loja, another old and interesting city lying on the borders of the province of Granada. The reader will find this city frequently referred to by the writer already quoted, but spelt Loxa—the x, like the j, is sounded h. It stands on a high rugged hill approached by an old bridge spanning the Xenil. It was here that the Moors made their last great defence against the army of Ferdinand and Isabella; and here our English yeomanry, under the Earl of Rivers, astonished Moors and Spaniards with their prowess and fearless bravery. This ruinous but still picturesque city has nothing of modern interest, except as a type of Spanish destruction and desolation. I had almost forgotten to say that it is the birthplace of the late Prime Minister of Spain, General Narvaez, and where he concocted many of his dark plans and intrigues. He only survived for a few months his rival, O'Donnell. The line of railway is now open from this city to Granada, where

we arrived at 7 P.M., after a long and rather fatiguing journey.

There are two large and good hotels on the hill adjoining the Alhambra, called the Siete Suelos and the Washington Irving; and in the town the two best or worst are the Victoria and Alameda, which have all the cold misery and irresponsible character of Spanish Fondas; let no one go there. One of my companions was an invalid, and was recommended to the Victoria as being the only hotel where there were fireplaces. Unfortunately, we went there; and this was a great blunder, as the two hotels in the Alhambra have fireplaces and many of the comforts and conveniences of English and French hotels, with a warm southern aspect, and are within the grounds of the Alhambra. When we speak of fireplaces in Spain, I should mention that this was an exceptional season. The thermometer was down to twenty-eight degrees the three nights we were at Granada, and the ice half-an-inch thick, and the cold as penetrating as if it had been ten or twelve degrees of frost, while in the sun at midday the heat was fifty-six to sixty degrees.

Many persons say they are disappointed with the Alhambra. I cannot say that it was so with me. I had seen panoramas and photographic views, and read up carefully its changeful history, and fully realised all my expectations. One needs no book here. Tower, and wall, and ruin tell the story, from the first settlement of the Arabs to the last devastations of the French vandals and Spanish restorers. Standing on one of the western towers of the palace wall, the view around is magnificent. Below extends a rich valley of twenty to thirty miles, surrounded with mountains, and in the distance is the snow-capped range of the Sierra Nevada glittering in the sun's rays. The town lies partly in the valley—and on the slopes of two hills—that of the Alhambra and another spur to the north, divided by the river Darro, which runs through the town, and soon after joins the Xenel, which waters the broad valley below. The poor, if there be any distinction, live on the slopes of the opposite hill, where the Gipsies or Gitanos live in miserable huts, or burrow like rabbits, in the face of the hill, with the pig, donkey, and children in close family intercourse.

When Granada was one of the chief cities and strong-holds of the Moor, the population was estimated at half a million; it is now about fifty thousand, without labour and without life, the picture of retrogression, so that one turns with something like pleasure from the present to the wreck of the past. A long avenue of elm trees leads up to the main entrance of the palace, and passing through a high horse-shoe arch, called the Gate of Justice, we approach, amidst ruins, the Palacio Arabe, the real Alhambra or palace of the Moors. This consists of a succession of halls and patios of the most beautiful and elaborate arabesque apartments, called the Hall of Ambassadors, Hall of Justice, Hall of the Abencerranges, Hall of the dos Hermanas—that is, the two sisters—the Hall Comares, the Mirador, the Court of the Sultana, and the Court of Lions, with smaller patios or courts, which I need not enumerate. The Court of Lions is that with which the public are most familiar, from the model in the Sydenham Palace, the destruction of which is sadly to be lamented. All honour to Mr. Owen Jones and the artists who were associated with him, to whom England owes so much for the genius, taste, and labour which gave it such a school of art and beauty, in which the poorest man in England may learn more than much cost and travel could accomplish! The original court is 120 by 65 feet; and there

are 120 marble pillars of 12 feet high. If my readers remember the beautiful porticoes on each side, and the fountain in the centre, and the matchless stalactite dome in the Hall of Ambassadors, they have only to increase this three or fourfold in imagination, and they will have all the courts, halls, and corridors that I have named, ornamented with inscriptions from the Koran and Arabian poets, interwoven with flowers and ornaments coloured like the border of a rich Cashmere shawl. These colours were blue, red, and yellow, with secondary colours of purple, green, and orange or gold. The colour has now almost disappeared, the walls having been whitewashed or plastered over half an inch thick by the *restoring* Spaniard, who could see no beauty in the fairy work of the tasteful Moors. Still sufficient remains to give one an idea of what it must have been in its pristine beauty. There are guides in a semi-military uniform who conduct the visitors round these apartments, but as usual hurry through the halls, so that I had to make three or four visits, and on each occasion to give a *douceur*. The artist or amateur should get an order from the captain-general, that he may visit when and how he likes, and he will find an ample reward for any time that he can bestow on their beautiful details.

I am trying to think of some familiar site to compare with the situation of Granada, but can find none. But for the Moorish palace and fort let us take the Castle and High Street of Edinburgh, and surround them with a wall of two and a-half miles, built irregularly to meet the configuration of the ground, with towers, bastions, and horse-shoe arched gates. Within this space imagine the palaces, mosques, gardens, and fountains of the Moors. The river Darro rushing down from the snowy range brought an abundant supply of water, which was conveyed into the grounds by an aqueduct, when every court and corridor and garden walk had their clear and cooling *jets d'eau*, where the luxurious Mussulman reclined on his silken cushions, with his black-eyed Fatima at his feet to mix his sherbet and administer to his wants. All this is now but a dream, and we awake to a scene of ruin and desolation.

I have said that the history of Granada is written on stone and brick. Charles V, true to the character of his adopted country, determined to add his chapter to its pitiful history, with poor and impotent efforts at grandeur. He gave orders to clear away a square of 250 feet of the most tasteful work of the Moors in order to build a palace that should eclipse all the works around. The outer walls are nearly finished; and round and over the doors are marble bas-reliefs of some merit, and over the entrance in large characters is the name of the founder, "Carlo Quinto." But the bare walls and roofless palace stand as a monument of the rise and decline of this empire—a poor, plain Doric ruin, passed with contempt, while the works of the despised Saracens, even in their ruins, are still the admiration of the world.

On a higher ridge, overlooking the palace, is the Sierra del Sol, from which the view extends from the snowy range of the Sierra Nevada down over the wide and fertile valley of the Provence. On this hill is a Moorish Palace reached through a beautiful avenue of cypress trees. This palace, called the Generalife, is still in good order, surrounded by the Arab's "garden of beauty." A branch of the Darro is led through the palace and gardens, which are thus kept in perpetual freshness. The apartments and terraces are in the pure Arabesque style, and in wonderful preservation, though many of the minute designs and much fine colouring have

been defaced by the "whitewash" mania of the Spaniards. The garden, through which the water flows, is one perpetual spring: terrace over terrace is filled with orange, lemon, laurel, and evergreens of every clime; the cypresses and myrtles are plaited and guided into every fanciful form. From the higher to the lower terraces, the stair balusters, of blue tiles, form a water-course, where the pure stream bubbles up in every form of beauty. From this garden by moonlight the view over the Alhambra is sad and sublime; the defects are hidden by the deep shadows of tower and wall, while the bright moon lights up the whole outline, and gives a solemnity and grandeur to the scene, which cannot be described. I could fill pages with my three days' experience, but I might tire your readers, and it is time for me to descend into the city again.

There are two institutions in Spain which may be said to flourish, "native to the soil," as far as pomp and pageantry can go, that is, their theatres and cathedrals. There is scarcely a finer theatre in Europe than the one in this dull, miserable, and poverty-stricken city, and the cathedral is amongst the finest in Spain. The latter is in the best style of Roman architecture. The groined roof is supported with groups of Corinthian columns, and there are altars innumerable, with some good pictures, and many gaudy trappings. The most interesting objects in the Royal Chapel are the tombs of Ferdinand and Isabella, and their immediate successors. These tombs are of fine white marble and alabaster, and in the best style of Italian art. The statues of both, lying side by side, are superb works of art, and said to be perfect likenesses. Coming out of this chapel I met my young American friend, who told me he had just been in to see these sepulchres, and that he "guessed them fixings must have cost a big sum of money." There is but a step from the sublime to the ridiculous, and the "fixings" must be the latter. Amongst the other churches and places we visited, I may refer, in passing, to the Cartuja, that is, the Carthusian Convent. This, though robbed of its silver ornaments and jewels by the French, is still a gem of art, in marble and alabaster, the doors richly inlaid with ebony and tortoise-shell, and the courts paved with slabs of white and black marble. Round the corridors is a series of indifferent frescoes, representing the martyrdom of the Carthusian Friars by Henry VIII. I have not much to say in favour of this "Pope King," except that he lived in the spirit of the Roman Church, and died under its ministers. But to give him his due, these paintings are a sad calumny on the memory of the bluff Harry, intended as an insult to the Protestants, and a warning to the youths of Spain to beware and fly from the Lutheran heresy. From this point we obtain a fine view of the Vega. This term does not exactly correspond with the English word "valley," but is nearer to the Scotch term "carse," a low, flat, fertile land spreading out for many miles.

It would be out of place here to give the reader a chapter of Spanish history, but it is difficult to describe the present state of this fine tract of country without some reference to its past history. This rich valley stretches out some thirty by twenty miles, and watered by the united streams of the Darro and Xenel. Before the expulsion of the tasteful and industrious Moors, it teemed with a population far in advance of the rest of Europe in agricultural skill and resources. The irrigation from these rivers formed a network through the Vega, which was cultivated like a garden, and of which scarcely a vestige now remains. It may be instructive to make some comparison between

the progress of a free and independent nation, and the retrogression of this unhappy country. At the beginning of the sixteenth century the population of Great Britain might be about three millions; that of Spain a century earlier was estimated at twenty-one millions. Since that time our population has increased to twenty-four millions, and we have populated the new world with upwards of thirty millions, who are in possession of our laws, religion, and political freedom. And following up the same principle, we are making a nation in Australia. Spain has now a population of fourteen millions, with ruined desolate cities, uncultivated fields, and hopeless indolence. So much for the Romish Church, and the "purifying influence" of the Inquisition, which, to use the epigrammatic language of our Yankee cousins, has succeeded in civilising the inhabitants off the face of the earth. About six miles off, and within view, is the property of the late Duke of Wellington, called the "Soto de Roma." It will be remembered that after the battle of Salamanca, which decided the fate of the Peninsula, this estate was presented to the Duke. I did not visit the property, and am unable to say what may be its condition or value, and it would not be safe to give perhaps the exaggerated information obtained from guides.

Our explorations ended, I returned by the same route to Malaga, much gratified with our journey; and with some of the same party engaged a passage in the steamer to Barcelona.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDD.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

VII.—POETS AND PAPERS.

YET another peep at the modest "folio of four pages;" and yet another view of that broad sheet which is its proud descendant in the modern "Times."

The parson poet, the Rev. George Crabbe, who was flippantly pronounced by the wits to be "Pope in worsted stockings," but whom Byron more correctly described as "Nature's sternest painter, yet her best," published, in the year 1785, a satirical poem called "The Newspaper," which he considered to be "the only poem (then) written on the subject." This poem was dedicated to the great Lord Thurlow, who, having once given the cold shoulder to the young and struggling poet, telling him that he had no time to read his verses, had afterwards, thanks to the great Edmund Burke, taken notice of Crabbe, invited him to dinner, given him a hundred pounds, told him (with an oath) that he was as like parson Adams as twelve to a dozen, and then presented him to two small livings.

When this same Lord Thurlow, at the outset of his career, occupied a tall stool in a solicitor's office in Southampton Row, he and his fellow clerk were constantly engaged, according to that clerk's testimony, "in giggling and making giggle, instead of studying the law." In after years, when Thurlow was rapidly growing into a great man, he was as slow to recognise his old office companion (who had now been called to the Bar) as he was to take notice of Crabbe. Eventually, however, he condescended to renew the acquaintance of his former fellow clerk; who repaid him by some verses "On the Promotion of Edward Thurlow, Esq., to the Lord High Chancellorship of England." Thurlow, who, thanks to

the magic of Sir Joshua's pencil, is handed down to posterity "looking wiser than a mere mortal," was himself a poet; or rather he was a stringer of rhymes. But his old office companion far outstripped him in the race to the Parnassus of poetic fame; and Lord Thurlow's name, in connection with verse, will not so much be remembered from his own "Angelica and Select Poems," as from those lines beginning "Round Thurlow's head in early youth" that were penned by William Cowper, the Chancellor's old desk companion in Southampton Row.

Although the parson-poet Crabbe has nowhere depicted so bright and charming a scene as that brought before us by Cowper, in the snug parlour at Olney, with its tea-table, drawn curtains, and the "folio of four pages" just brought by "the herald of a noisy world," and the peeps that could be then taken at that world through the loopholes of retreat; yet he has, with much painstaking, painted many pictures of domestic life in England, that in themselves constitute a national gallery of peculiar value. In these pictures the newspaper of the day finds its place.

It is noteworthy that the two descriptions of the newspaper by Crabbe and Cowper, were published almost simultaneously in 1785; Crabbe's poem being a little in advance of Cowper's. Thus, as "The Task" had not yet appeared, to leap at one bound into public prominence, and, in Southey's language, to make "the best didactic poems when compared with 'The Task,' like formal gardens in comparison with woodland scenery," Crabbe was fully justified in claiming for his own poem the merit of "novelty," and in assuring his readers that he believed it to be the only poem then written on the subject. And, indeed, although the fourth book of "The Task" gives such a full description of the newspaper and its varied contents, yet, Crabbe's poem is restricted to the one subject of its title, "The Newspaper," his views of which materially differed from those of Cowper on the same subject. For the political predilections of the parson-poet caused him to take a very low estimate of the journals of the day. In his opinion, "the more of these instructors a man reads, the less he will infallibly understand." One set of writers was abusing his patron Burke and the Coalition Ministry; while another set pursued a similar course with his other patron, the Duke of Rutland, to whom he was domestic chaplain, and from whose princely residence, Belvoir Castle, the poem of "The Newspaper" was issued. Thus, the views of the journals of the day were strongly coloured by the party spirit of the age, and caused his poem to be chiefly written in the satirical vein. Not that we, in these days, are entire strangers to those "wordy wars" maintained by "party pens;" although the system of journalistic warfare in which virulent recrimination and personal abuse are freely mingled, is, nowadays, commonly relegated to such purely provincial newspapers as the "Eatanswill Gazette" and the "Eatanswill Independent," and to such purely provincial personages as the Buff and Blue editors of those two redoubtable journals. In the provinces, party spite will still flourish with a luxuriance greatly in contrast to the humility and cautious tone assumed by the country newspapers when they were first established; for then they altogether abstained from politics, and merely gave a dry abstract of events. They were, in reality, papers of news, and chronicled in brief fashion the incidents of the day. Two of the very earliest of these papers, the "Worcester Journal" and the "Stamford Mercury" still flourish and maintain a high character.

It might have been thought that Dr. Johnson's connection with the Press would have restrained him from dealing out his sturdy anathemas against his fellow journalists. But, in "The Idler," he quotes the definition of an ambassador—which, by the way, Isaac Walton says was originally written in Latin in the album of Christopher Flecamore, by Sir Henry Wotton, when ambassador at Venice—"a man of virtue sent abroad to tell lies for the advantage of his country;" and, says Dr. Johnson, "a news-writer is a man without virtue, who writes lies at home for his own profit. For these compositions is required neither genius nor knowledge, neither industry nor sprightliness; but contempt of shame and indifference to truth are absolutely necessary." This was pretty much the opinion of Crabbe; though Cowper took a milder view; and, in his poem on "Charity," he expresses his sense of the leading deficiency in journalism in the following couplet:—

"Did charity prevail, the press would prove
A vehicle of virtue, truth, and love."

We may congratulate ourselves that the corrupted character of journalism, with its scandal, slander, fraud, falsehood, and folly, which was permitted to degrade the newspaper press of Crabbe's day, and which he lashed with pardonable, though stinging, severity, has given place to a Press, which (with rare exception) is an honour to the country that has produced it. Letters of "Junius" would now be as great an anomaly in the Thunderer's pages, as though its broad sheet were converted into the repulsive similitude of a "scourge" or "satirist." Crabbe's friend Burke could scarcely have said, in 1868, that he who reads a newspaper for a year, will, at the twelvemonth's end, hold the same opinions as the writer of the paper. For, although public opinion is undoubtedly greatly influenced by the Press, yet, newspapers have been so multiplied since Burke's day, that a politician is no longer content with reading his one journal, but scans a goodly sheaf of "dailies" and "weeklies," in which the various sides of a question are regarded from as many different stand-points. Thus, in every argument, political or otherwise, we hear counsel's opinion, on either side; we examine the witnesses for the prosecution and defence; and then we sum up our judgment as best we may. The influence of the individual newspaper to mould, guide, and sway its reader, has probably gone; at any rate, in the full sense in which Burke spoke of its power.

It is to the last ten years that we must turn for the greatest proportionate increase of newspapers in any similar period since the first publication of the gazettes, "Daily Courant" and "Weekly News." In 1858 the total number of journals published in the United Kingdom was 866; in the present year, according to "The Newspaper Press Directory for 1868," their number is 1,324, of which 85 are daily papers. In 1858 the number of daily papers was less than half this total, viz., 41, of which 29 were published in England, 5 in Scotland, and 7 in Ireland. The alteration in the stamp and paper duties partly accounts for the great increase of the past ten years; and the establishment of cheap newspapers has added to the number of readers and furthered the demand. The above-named official authority thus divides the 1,324 newspapers issued in the United Kingdom in the present year: in London, 253; in the provinces, 751; in Wales, 49; in Scotland, 132; in Ireland, 124; in the British isles, 15. Of these, there are 58 daily papers published in England; 1 in Wales; 12 in Scotland; 13 in Ireland; and 1 in the British isles. And, in addition to these 1,324 newspapers, there are

621 magazines, in some of which a summary of news is given and the immediate topics of the day are handled. When we consider this, and that the issue of new books in 1866 was 4,204, and, in 1867, 4,144, we have before us a body of statistics that is truly formidable in its amount and cannot readily be grasped from its very vastness. To these considerations might also be added that suggested by the thought of the innumerable journals published in the same English language in various quarters of the world; but this would lead us into a field of enquiry far too large to be traversed here. I might, however, refer to an extraordinary fact mentioned not long since by the Bishop of Peterborough, at the annual meeting of the district branch of the Church Missionary Society, that the liberty of the Press and the influence of journalism in India have recently been developed in a remarkable degree; and, that in addition to the twenty newspapers now published in Bengalee and Persian, in Calcutta alone, there are others, written in English by native Indians, which exhibit a familiar acquaintance with the current events in European life. The Bishop specially instanced the "Hindoo Patriot," and said, "It is in English, and is written and edited entirely by native Hindoos, not Christians, but all more or less belonging to the liberalized Hindoo school of theology. It is really difficult to believe that its articles and correspondence are not the work of educated Englishmen; while the tone in which it recognises the identity of Indian and English interests, and steadily contemplates a time when India will be administered by native officials, as a loyal and integral portion of the British empire, is still more remarkable." And the Bishop expressed his opinion that the religious regeneration of India was equally as hopeful as were its political and social prospects; and that the influence of the Press was for good, and in harmony with missionary work.

The friendly work of the electric telegraph in linking together distant nations, must not be forgotten as an important adjunct to newspaper success. Some remarkable instances of recent telegraphic triumphs were given in the "Varieties" column of this periodical, for May, page 352. The longest express that has, as yet, ever been sent through the wires, either in England or America, since the establishment of the system of electric-telegraphy, was early in the present year, when Mr. Gladstone made his two speeches at Ormskirk and Southport. Both these speeches appeared at full length in the "Times" and "Daily Telegraph" of the next day. The Southport speech alone filled nearly five columns of the paper. It was taken to Liverpool by train, reaching there at 11.25 at night. In five minutes the wires had begun to flash its sentences to the metropolis; and at 1.40 in the morning the last word of the speech, scarcely cold from the speaker's lips, was spelled out at the central telegraph station in London. The total number of words transmitted of Mr. Gladstone's speeches was 30,745; and soon after ten in the morning, I read them in the "Times" broad-sheet, in the sequestered village of Minima-Parva, 74 miles from London. If this be not a marvel, where shall we look for wonders?

And this supplement of the "Times," that is so often cast aside after a glance at its first column, is not that, too, a marvel in itself—a marvel of arrangement, accuracy, and display of the multifarious wants and requirements of the people? Mr. John Parry used to sing that he knew not "a cure that's so good for the vapours, as reading the 'wants' that appear in the papers;" and here they are, in serried files and compact columns, from those who want places for their money, to those

who want money for their places. The advertisements have developed in number in proportion with the size of the sheet required to contain them; for in the very first number of the "Times" there were but 63 advertisements; and those of the briefest. (Crabbe, by the way, places the long accent on the penultimate; "Now Puffs exhausted, Advertisements past.") As the "Times" excludes all objectionable advertisements, — including those of the "Racing Tips,"—we may take a broad view of its broad sheet, without meeting with anything offensive. It is a sign of healthiness when the face of a newspaper is freed from noisome eruptions; and this, with few exceptions, is the rule of the metropolitan press. It is in the provincial newspapers that quacks are too freely permitted to set their traps—baited with "the government stamp"—for the foolish, the vicious, and the unwary. Crabbe speaks of them in his poem:—

"When, lo! the advertising tribe succeed,
Pay to be read, yet find but few will read;
And chief th' illustrious race, whose drops and pills
Have patent powers to vanquish human ills:—"

and his seventh letter in the poem of "The Borough" is chiefly devoted to an exposure of the advertising quacks:—

"Void of all honour, avaricious, rash,
The daring tribe compound their boasted trash—
Tincture or syrup, lotion, drop, or pill;
All tempt the sick to trust the lying bill."

But quacks still flourish, and will probably continue to do so while human credulity exists. Fear and fancy go a long way. "There is hardly a man in the world, one would think," said Steele, "so ignorant as not to know that the ordinary quack-doctors, who publish their great abilities in little brown billets, distributed to all who pass by, are, to a man, impostors and murderers. Yet, such is the credulity of the vulgar, and the impudence of those professors, that the affair still goes on, and new promises of what was never done before, are made every day. What aggravates the jest is, that even this promise has been made as long as the memory of man can trace it, yet nothing performed, and yet still prevails." We may observe that of those "sleeping cordials" mentioned by Crabbe (in "The Borough") the sale is still so great, especially in the Fen counties, that Dr. Alfred Taylor, in his report to the Lords of the Privy Council, in August, 1864, in speaking of the sale of "Godfrey" and opium, said, that the average annual consumption of opium in one district in Lincolnshire was at least 100 grains per head, and that at one shop, as many as from three to four hundred customers would, on a Saturday night, be served with opium, sold in pills and penny sticks. The use of opium as a leading cause of infant mortality in the Fens, is also mentioned in Mr. J. E. White's valuable report in "The Children's Employment Commission," issued last autumn,* and it is there stated, on the authority of the medical officer of the Privy Council, "that in some entirely rural marsh districts, the habitual mortality of young children is almost as great as in the most infanticidal of our manufacturing towns." What a picture of our modern Arcadia!

To "Daffy's Elixir" we may allow the privilege of hanging on to the skirts of an English classic; for it was advertised in Addison's "Spectator" for April 18th, 1712, the year in which the newspaper tax in the form of a stamp was first imposed. In "Bon Gualtier's Poems" (by Professor Aytoun and Mr. Theodore Martin) appeared sprightly and humorous poems on Parr's Life

* See p. 74 of the Blue Book, "Sixth Report of the Commissioners, 1867."

Pills, Rodger's Razors, Mechi's Silver Steel, Hodgson's Pale Ale, Doudney Brothers' Clothes, Pear's Transparent Soap, and the Virginia Hams at 50, Bishopsgate Within. These pieces were given by their authors as "example of that new achievement of modern song, which, blending the *utile* with the *dulce*, symbolises at once the practical and spiritual characteristics of the age, and is called familiarly, the puff poetical." Such versical puffs, however, are relegated to the columns of provincial newspapers, and "poets and papers" are seldom found in conjunction in the daily London journals in the form of the puff poetical on Warren's Blacking, Moses' Suits, and Rose's Tea. Illustrations and peculiarities in type are also forbidden; and advertisers are thus driven to various expedients in order to attract the roving eye of the reader. Claiming a whole page of a newspaper is a very expensive affair. Above a hundred pounds is the charge for a page in the "Times," yet this is often paid, especially by publishers at the commencement of their various seasons. A whole column filled by one advertiser is very common, and a favourite device is to repeat the same words over and over again in single or double lines, or to arrange various-sized paragraphs at regular intervals; or to leave such blanks in the lines as to make a sort of pattern that can hardly fail to attract notice.

The general advertisements are classified and arranged, especially in the "Times," in a wonderfully easy way for the reader, who, after but a slight acquaintance with his newspaper, will know where to turn for his particular advertisement, whether it relates to coal or coffee, wines or waggonettes, packet-ships or perambulators, soups or soaps, plate or pickles, theatres or toilette tables, china or concerts, hotels or hats, photographs or poultry, lamps or lozenges, croquet or charity, teeth or Turkey carpets, ironmongery or institutions, railways or refuges, tea or trowsers, suppers or schools, auctions or asylums, banks or books, spectacles or sewing machines, silks or sauces, hair dyes or harmoniums, monograms or magic lanterns. To peculiar advertisements are accorded a special place in certain papers; thus, those charitable ladies and gentlemen, who for a month or two have been working with a forty-secretary power, to secure the election of a little boy or girl to some asylum or school, will know, that for the advertised result of such election, they must turn to the inner page of the chief sheet of the "Times," immediately over the theatrical advertisements. The special notices of the learned societies are also given at the head of the same page. In the "Times," the column of mystery is the second in the front sheet of the supplement; but in the "Daily Telegraph," it is the last column on the back sheet. The latter, therefore, cannot be accused of being an accomplice in a scheme in which the former has (it is said) unwittingly been often made to play its part. The first column of the "Times" sheet is that which gives the births, marriages, and deaths, which notices, as they are all paid for, very properly head the advertisements. The paper is brought to Paterfamilias at the breakfast table, and its Supplement, or "lady's portion," is handed to his grown-up daughter, in order that she may look at the first column and see, as Crabbe says,—

"What new-born heir has made his father blest,
What heir exults his father now at rest."

but she glances at the second column, and there reads something to this effect:—"Forget me not. Waited till six. So sorry. Try same time and place on Thursday." If, however, this clandestine correspondence is adopted, it is at any rate some satisfaction to know, that it is by no means so cheap as the penny post, or so commendable as the ordinary straight-forward and

honourable course. The young may be assured that usually these notices are the traps of knaves for fools. And it is anything but romantic to pay for the insertion of an enigmatical love-letter in the same column with the lost people, strayed dogs, and stolen purses.

Occasionally, the advertising columns of the "Times," present us with other languages than our own, that necessitate the use of particular types; thus, in February last, the performance of Mr. Bandmann was advertised in German; and in the previous December, a printer advertised his readiness to undertake the printing of any works in the Abyssinian language, and gave a specimen of the type.

RECENT ARCTIC DISCOVERY.

WE have not yet seen "the last of the Arctic voyages." The solution of the mystery of Sir John Franklin's fate marked a period in the story of northern adventure, but neither the conclusion of this search, nor the discovery of "the north-west passage," can satisfy all the demands of science, nor the projects of adventure. A plan was formed by certain German geographers for a new exploration of the North Polar regions. A distinguished Prussian naval officer was selected for the command, and various preparations commenced, when the war with Austria absorbed public attention, and this private expedition was for the time abandoned. It is understood that the Prussian government has again taken steps to resume the exploration. Meanwhile we may keep our readers abreast of the subject by presenting the following report by Captain Sherard Osborne, who has thus narrated the most recent discoveries in the Arctic regions:—

"In Baffin's Bay, Captain Richard Wells, of the steamship Arctic, of Dundee, has been farther north in his ship in open water than any navigator had previously reached. His affidavit, forwarded to me by Allen Young, the distinguished companion of Sir Leopold McClintock in his last memorable voyage, is very clear, and bears the impress of truth.

"As early as the 20th of June last, the Arctic proceeded up Baffin's Bay, crossed the face of the glacier of Melville Bay, steamed away past Cary Isles and Hakluyt Island, visited Whale Sound of Baffin, and the subsequent scene of Dr. Kane's adventures. Captain Wells then, finding open water to the north, crossed to the west side of Smith's Sound, and still, tempted by a fine open sea, went on till he sighted Kane's Glacier of Humboldt, and must, he says, have then been in the 79th north parallel—considerably north of where I reached in 1850 in the Pioneer—beyond Inglefield in the Prince Albert, and beyond Kane in the Advance. The bold Dundee whaler was still in open water, and adds, 'I should have continued my course northwards had I seen a fish. There was no indication of ice to the northward, the sky blue and watery, and only a few small streams of light ice to be seen.' Of course, Captain Wells did right in not being tempted to risk his owner's property into the unknown straits before him, but I am sure all living Arctic officers will feel with me. Would that one of us, with a well-found discovery ship, could that day have been where the Arctic was, only 660 miles from the Pole, and I feel pretty sure, from Kane's report, that we know what to expect for at least another 120 miles, or within 540 miles of the axis of the globe.

"Had Arctic explorers listened to me in 1865, we should probably before this have solved the great problem, by the very open road which Kane and Hayes saw, and

which it was the good fortune of Wells, of Dundee, to reach. They allowed a red herring to be trailed across the track, and ran wild after open water and hot water routes *vid* Spitzbergen, and, as the Duke of Somerset very justly said, until they made up their minds as to the right road to the Pole, he could not possibly be expected to entertain any such project.

"Another remarkable voyage has been made from the Pacific Ocean by a whaler called the Nile. She has rediscovered an extensive land, which will be found recorded on all our Admiralty charts since 1850. The Russian Admiral Wrangel first mentioned it in the account of his remarkable survey of the Siberian shores of the Arctic Ocean. The Tchukties, now wandering near Cape Chelagskoi, aver that a tribe called the Onkillon fled before them across the frozen sea to a land lying north of Siberia, and occasionally seen from Cape Jakan. Wrangel questioned its existence, I believe, but Admiral (then Captain) Kellett, in her Majesty's ship *Herald*, in 1850, sighted this land some thirty miles distant; and although he would not name it, as he could not land upon it, he said, as far as eyesight could be trusted, it was land of a bold character, extending from about 175° to 180° W. long., and in lat. 71° N.

"It is a verification of this discovery which the whaler Nile brings us this year. By an extract from an American paper, which our geographical commander-in-chief, Sir Roderick Murchison, was good enough to send me the other day, I find that the sea within Behring's Straits was so clear of ice this last summer that the good ship Nile reached considerably closer to, but it does not appear that any one landed on, Kellett's Land. Her enterprising captain traced the land, so far as I can learn, to the 73rd degree north latitude, and saw it still reaching away to the northward in all the magnificence of snow-capped cliffs and mountain peaks.

"The Nile has thus done us good geographical service, though her discovery will somewhat bar the road of an illustrious German philosopher, who feels sure of a watery highway from Spitzbergen to Behring's Straits."

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER XLVI.—ONCE MORE IN THE LANE CUT THROUGH THE WOOD.

It is perhaps hardly necessary to say that the discovery of the villainy of Thomas Dickson freed the minds of Mr. Sinclair and his niece, and Dr. Pendriggen from a suspicion which they could not help entertaining that Henry Talbot had been in some way concerned in the theft of the pocket-book. It was difficult otherwise to account for the way in which the locket had come into Mary Talbot's possession. As has been heretofore hinted, since the day on which the story heard by Miss Talbot in old Dame Hoolit's cottage had been set afloat—by some means or other, as every secret becomes known in a country village—it had been generally suspected, by others besides Jemmy Tapley, that the young governess did really possess the lost trinket. This suspicion on the part of her friends had in no degree lessened their kindness to Mary herself, or decreased the respect and esteem in which they held her. On the contrary, it rather led them to regard her with greater kindness and sympathy, since no one suspected that she was in any respect to blame, or that she had the slightest idea, until long after her brother's departure for America, to whom the trinket he had left with her had originally belonged. Nevertheless it was a great relief to them to

learn that, through the discovery of Dickson's guilt, Henry Talbot stood completely exculpated. Though they delicately abstained from any allusion to the matter in Mary's presence, it was manifest to the young lady that there was more than ordinary meaning in the congratulations she received on her brother's happy return, nor had she any difficulty in surmising the cause of her friends' unusual sympathy.

There was one alone of Mary's friends who knew nothing as yet of the happy turn of affairs—one whose opinion she valued as highly, perhaps more highly, than that of any other person. Mr. Sharpe was absent from St. David on a visit to his mother when the Mohawk arrived at Falmouth. He did not return until a week afterwards, and Mary was still unaware that he had returned, when one morning she set out to visit a young woman who had been one of her elder pupils, and who had recently married a farmer who lived at some distance from the village. On her return her homeward path led her along the lane cut through the wood, in which she had first heard from Mr. Sharpe the true story of the robbery of the pocket-book, and in this lane she and the young curate had subsequently met and parted, not in coolness, still less in enmity, yet with mutual feelings of sorrow which weighed heavily upon them, for Mary had declared that circumstances, over which she had no control, had interposed an insurmountable barrier between them.

Since that day they had often met and had once interchanged letters, but unless to exchange a brief "good-morrow" they had never spoken.

Mary Talbot's thoughts reverted to this last meeting and parting when she entered the lane, which she had never passed through since that well-remembered day. She knew now that the barrier her once sensitive feelings had raised was removed. She remembered that the curate had assured her in his letter that he loved and respected her more than ever, and had urged her to cast aside all conventional prejudices and idle fears, and to allow matters to be between them as they had been; and that *she*, though her heart had sunk within her, and life had seemed to lose its brightness as she penned the words, had replied that the duty she owed to herself and others, as well as her esteem and regard for him, and her anxiety for his future welfare, forbade this. She remembered also that she had assured him that she could not any longer hold him bound to his promise, that the bonds which had existed between them were sundered, and that he was free to act as he pleased without regard to her. She wondered now whether he had taken her at her word, and trembled lest such should be the case. Much as she had to be thankful for, and to rejoice over, she still felt that there was one thing needful to perfect her earthly happiness. Yet *she* could do nothing in the matter. It rested with *him*, and with *him* only to render—as she thought at this moment—her happiness complete, or to cause her future life to be lonely and desolate.

It was only now, when the troubles and anxieties which had so long oppressed her were removed, that she discovered how large a place he held in her heart; what an aching void would be there were he to separate himself from her for ever.

It was a lovely afternoon near the end of autumn. The sun shone bright and warm, and the birds were singing merrily in the deep recesses of the wood. The sky was almost cloudless, and the atmosphere was heavy with the perfume of autumnal wild flowers.

And yet there was a tone of melancholy pervading everything above and around her. The light breeze

seemed to murmur sorrowfully amid the parti-coloured foliage the requiem of the departing year, and the withered leaves, strewn on the ground and still falling rapidly from the trees, foreshadowed the coming desolation of winter. A mournful cadence seemed to mingle with the blithe carol of the birds, as if they were conscious that the time was at hand when all their songs must cease, and when all their efforts would be needed to procure the scanty food they could gather from the snow-covered earth. The bees, busy among the autumnal flowers, no longer hovered in the air as if to make their choice of sweets, or sipped daintily from petal to petal, but hurried over their tasks as though they were instinctively aware that it was necessary to make the most of the few fine days that remained to them, ere their labours perform must cease.* The sea-waves resounded with melancholy moan from the distant shore; and there was in the atmosphere that oppressive languor, peculiar to the season, which tells that Nature is weary and is sighing for her winter repose.

All this was in unison with Mary's feelings at this moment, as, deeply absorbed in thought, her eyes fixed on the ground, she passed slowly through the solitary lane. Presently, however, she fancied she heard the sound of footsteps amongst the withered leaves, and raising her head she started, and stood still with surprise on perceiving Mr. Sharpe within a few paces of the spot, and coming towards her.

A choking sensation rose to her throat and prevented her utterance; her limbs trembled beneath her weight; she blushed and grew pale by turns, and the woods and pathway seemed to be whirling around her. It was so strange, so startling to see him of whom her thoughts were full, and whom she believed to be fifty miles distant, standing before her, as if by her thoughts she had summoned him into her presence.

Mr. Sharpe, though he had really walked out purposely to meet her, was hardly less disconcerted than herself. He had cut through the wood and come upon her unexpectedly, and before he was aware of the fact. For the moment all his native bashfulness returned to him. His face flushed, and he stopped suddenly as he saw her. He, however, was the first to recover his composure.

"Miss Talbot—Mary!" he said, "I have just heard what has rejoiced me beyond measure. I knew that you had walked out, and as soon as I heard the news I came forth to meet—to congratulate you. You—you are glad to see me, are you not, Mary? I may call you Mary again now?" he added, advancing and taking the young lady's hand.

Still Mary did not speak. She stood nervously turning over the dry leaves with the tip of her parasol, still trembling, and not daring to raise her eyes from the ground lest she should betray her emotion.

"Mary, why do you not speak?" said the curate. "You are not annoyed at me? You are not angry because I have called you Mary?"

* * * * *

Well, we would as soon try to describe the cooing of turtle doves as the soft sayings of such a scene.

For some minutes the newly betrothed pair walked on in silence. There is a fullness of joy too great for words, as there is a depth of grief too deep for tears. Their hearts were too full of gladness for speech.

* This is no mere poetic fancy. It is well known that the wild bees of the American woods hurry quickly over their labours, as the autumn advances, as if instinctively conscious of the approach of winter. The author has remarked this fact, and has frequently heard it remarked by others.

But how was it that to Mary's senses the melancholy, which but a short time before had seemed to pervade the scene, had disappeared? How was it that the songs of the birds, which had but a few moments before seemed to breathe a mournful cadence, now trilled forth as if the little feathered songsters were jubilant with joy and gladness? How came it that the gentle breeze which had whispered sadly to the falling leaves, now breathed happy music? that the waves of the sea which but erstwhile sent forth a hollow, melancholy moan, seemed now to murmur sweet sounds of peace and rest? How had it come to pass that in a few short moments, the fields, the woods, the sky above, the entire face of Nature, which had appeared to wear but a transient gladness in the autumnal sunshine, as though mourning amidst its smiles the quickly departing year, had undergone a change, and now seemed bright and hopeful as in early spring?

How all these changes had been brought about I leave my readers to explain to themselves; as also how it came to pass that, even to the close of their lives, the lane cut through the wood was a favourite walk with both the curate and Mary, ever recalling to mind sweet sorrow succeeded by a great joy.

But few words were interchanged between the betrothed couple during the remainder of their walk to the village, and these few were spoken at random, and had no bearing towards the feelings that filled their hearts. At the entrance of the village they separated, almost as silently as once before they had parted on the same spot, and each walked homeward alone; but with thoughts and feelings how widely different from those which had then occupied their minds, and how much happier than they had parted then.

That evening Mary told her long-treasured secret to her brother, and received his hearty congratulations; and the next day she wrote to her faithful friend, Mrs. Margaret, who had returned to her home, and confided to the good old lady all her bright anticipations in the future. At that happy moment she had no doubts nor fears; and before she closed her eyes that night, she poured forth her soul in gratitude and thanksgiving.

CHANGE-RINGING EXTRAORDINARY.

A REMARKABLE feat in bell-ringing is worthy of being here recorded. On Monday, April 27, the day when bells were rung and guns fired on account of the welcome news of the close of the Abyssinian war, eight members of the "Ancient Society of College Youths" occupied the belfry at St. Matthew's Church, Bethnal Green, by permission of the rector, and rang, in nine hours and twelve minutes, a true and splendid peal of Kent Treble Bob Major, consisting of 15,840 changes. This is the greatest number of changes ever rung by eight men on eight bells. We are informed that the ringing was most beautiful throughout, especially in the last peal, in which there could hardly have been a fault "pricked" by the most severe critic. The peal was composed by Mr. Thomas Day, of Birmingham, and conducted by Mr. H. W. Haley. When it is considered that the men were locked in the belfry, and did not cease ringing from 8.45 A.M. until they had finished the peal, the performance may indeed be said to stand almost unrivalled among such musical and athletic feats.

What recent efforts approached this success may be known to campanologists, but our only standard of comparison at the moment is a fact stated by Southey in "The Doctor:" "Eight Birmingham youths, some of them under twenty years of age, ventured on a complete peal of 15,120 Bob Major. After they had rang upwards of eight hours and a half, they found themselves so fatigued that they desired the caller would take the first opportunity to bring the bells home. This he soon did, by omitting a Bob, and so brought them round, thus making a peal of 14,224 changes in eight hours and forty-five minutes; the longest which was ever rung in that part of the country, or perhaps anywhere else."

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

A STRANGE SAIL.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER II.

I MAY as well here give an account of the Barbara, and how I came to be on board her. Deprived of my father, who was killed in battle just as I was going up to the University, and left with very limited means, I was offered a situation as clerk in the counting-house of a distant relative, Mr Janrin. I had no disinclination to mercantile pursuits. I looked on them, if carried out in a proper spirit, as worthy of a man of intellect, and I therefore gladly accepted the offer. As my mother

No. 863.—JULY 11, 1863.

lived in the country, my kind cousin invited me to come and reside with him, an advantage I highly appreciated. Everything was conducted in his house with clock-work regularity. If the weather was rainy, his coach drew up to the door at the exact hour; if the weather was fine, the servant stood ready with his master's spencer, and hat, and gloves, and gold-headed cane, without which Mr. Janrin never went abroad. Not that he required it to support his steps, but it was the mark of a gentleman. It had superseded the sword which he had worn in his youth. I soon got to like these regular ways, and found them far pleasanter than the irregularity of

PRICE ONE PENNY.

some houses where I had visited. I always accompanied Mr. Janrin when he walked, and derived great benefit from his conversation, and though he offered me a seat in the coach in bad weather I saw that he was better pleased when I went on foot. "Young men require exercise, and should not pamper themselves," he observed; "but, James, I say, put a dry pair of shoes in your pocket—therein is wisdom; and don't sit in your wet ones all day."

Thus it will be seen that I was treated by my worthy principal from the first as a relative, and a true friend he was to me. But I was introduced into the mysteries of mercantile affairs by Mr. Gregory Thursby, the head clerk. He lived over the counting-house, and on my first appearance in it, before any of the other clerks had arrived, he was there to receive me. He took me round to the different desks and explained the business transacted at each of them. "And there, Mr. James, look there," he said, pointing to a line of ponderous folios on a shelf within easy distance of where he himself sat: "see, we have Swift's works, a handsome edition too, eh!" and he chuckled as he spoke.

"Why I fancied that they were ledgers," said I.

"Ha! ha! ha! so they are, and yet Swift's works, for all that, those of my worthy predecessor, Jeremiah Swift, every line in them written by his own hand, in his best style; so I call them Swift's works. You are not the first person by a great many I have taken in. Ha! ha! ha!"

This was one of the worthy man's harmless conceits. He never lost an opportunity of indulging in the joke to his own amusement; and I remarked that he laughed as heartily the last time he uttered it as the first.

I set to work diligently at once on the tasks given me, and was rewarded by the approving remarks of Mr. Janrin and Mr. Thursby. Mr. Garrard had long ago left, not only the business, but this world; the "Co." was his nephew, Mr. Luttridge, who was absent on account of ill health, and thus the whole weight of the business rested on the shoulders of Mr. Janrin. But, as Thursby remarked, "He can well support it, Mr. James. He's an Atlas. It's my belief that he would manage the financial affairs of this kingdom better than any Chancellor of the Exchequer, or other minister of state, past or present; and that had he been at the head of affairs we should not have lost our North American Colonies, or have got plunged over head and ears in debt as we are, alack! already; and now, with war raging and all the world in arms against us, getting deeper and deeper into the mire." Without holding my worthy principal in such deep admiration as our head clerk evidently did, I had a most sincere regard and respect for him.

Our dinner hour was at one o'clock, in a room over the office. Mr. Janrin himself presided, and all the clerks, from the highest to the lowest, sat at the board. Here, however, on certain occasions, handsome dinners were given at a more fashionable hour to any friends or correspondents of the house who might be in London. Mr. Thursby took the foot of the table, and I was always expected to be present. At length I completed two years of servitude in the house, and by that time was thoroughly up to all the details of business. I had been very diligent. I had never taken a holiday, and never had cause to absent myself from business on account of ill health. On the very day I speak of we had one of the dinners I have mentioned. The guests were chiefly merchants or planters from the West Indies, with a foreign consul or two, and generally a few masters of merchantmen. The guests as they arrived were

announced by Mr. Janrin's own servant, Peter Kloops, who always waited on these occasions. Peter was himself a character. He was a Dutchman. Mr. Janrin had engaged his services many years before during a visit to Holland. He had picked Peter out of a canal, or Peter had picked him out, on a dark night, I never could understand which had rendered the service to the other; at all events it had united them ever afterwards, and Peter had afterwards nursed his master through a long illness, and saved his life. The most important secrets of state might have been discussed freely in Peter's presence. First, he did not understand a word that was said, and then he was far too honest and discreet to have revealed it if he had.

Several people had been announced. Ten minutes generally brought the whole together. I caught the name of one—Captain Hassall. He was a stranger, a strongly-built man with a sun-burnt countenance and bushy whiskers; nothing remarkable about him, except, perhaps, the determined expression of his eye and mouth. His brow was good, and altogether I liked his looks, and was glad to find myself seated next to him. He had been to all parts of the world, and had spent some time in the India and China seas. He gave me graphic accounts of the strange people of those regions; and fights with Chinese and Malay pirates, battles of a more regular order with French and Spanish privateers, hurricanes or typhoons. Shipwrecks and exciting adventures of all sorts seemed matters of every-day occurrence. A scar on his cheek, and another across his hand, showed that he had been at close quarters, too, on some occasion, with the enemy.

Mr. Janrin and Mr. Thursby both paid him much attention during dinner. Allusions were made by him to a trading voyage he had performed in the service of the firm, and it struck me from some remarks he let drop that he was about to undertake another of a similar character. I was not mistaken. After dinner, when the rest of the guests were gone, he remained behind to discuss particulars, and Mr. Janrin desired me to join the conclave. I was much interested in all I heard. A large new ship, the *Barbara*, had been purchased, of which Captain Hassall had become part owner. She was now in dock fitting for sea. She mounted ten carriage guns and four swivels, and was to be supplied with a proportionate quantity of small arms, and to be well manned. A letter of marque was to be obtained for her, though she was not to fight except in a case of necessity; while her cargo was to be assorted and suited to various localities. She was to visit several places to the east of the Cape of Good Hope, and to proceed on to the Indian Islands and China.

"And how do you like the enterprise, James?" asked Mr. Janrin, after the captain had gone.

"I have not considered the details sufficiently to give an opinion, sir," I answered. "If all turns out as the captain expects, it must be very profitable, but there are difficulties to be overcome, and dangers encountered, and much loss may be incurred."

I saw Mr. Janrin and the head clerk exchange glances, and nod to each other. I fancy that they were nods of approval at what I had said.

"Then, James, you would not wish to engage in it in any capacity?" said Mr. Janrin. "You would rather not encounter the dangers and difficulties of such a voyage?"

"That is a very different matter, sir," I answered, "I should very much like to visit the countries you speak of, and the difficulties I cannot help seeing would enhance the interest of the voyage."

Again the principal and clerk exchanged glances and nodded.

"What do you say then, James, to taking charge of the venture as supercargo? My belief is that you will act with discretion and judgment as to its disposal, and that we shall have every reason to be satisfied with you. Mr. Thursby agrees with me. Do you not, Thursby?"

"I feel sure that Mr. James will bring no discredit on the firm, sir," answered Mr. Thursby, smiling at me. "On the contrary, sir, no young man I am acquainted with is so likely to conduce to the success of the enterprise."

I was highly gratified by the kind remarks of my friends, and expressed my thanks accordingly, at the same time that I begged I might be allowed two days for consideration: I desired, of course, to consult my mother, and was anxious also to know what another would have to say to the subject. She, like a sensible girl, agreed with me that it would be wise to endure the separation for the sake of securing, as I hoped to do, ultimate comfort and independence. I knew from the way that she gave this advice that she did not love me less than I desired. I need say no more than that her confidence was a powerful stimulus to exertion and perseverance in the career I had chosen. My mother was far more doubtful about the matter. Not till the morning after I had mentioned it to her did she say "Go, my son; may God protect you and bless your enterprise!"

I was from this time forward actively engaged in the preparations for the voyage. My personal outfit was speedily ready, but I considered it necessary to examine all the cases of merchandise put on board, that I might be properly acquainted with all the articles in which I was going to trade. "It's just what I expected of him," I heard Mr. Janrin remark to Mr. Thursby, when one evening I returned late from my daily duties. "Ay, sir, there is the ring of the true metal in the lad," observed the head clerk.

Captain Hassall was as active in his department as I was in mine, and we soon had the *Barbara* ready for sea with a tolerably good crew. In those stirring days of warfare it was no easy thing to man a merchantman well, but Captain Hassall had found several men who had sailed with him on previous voyages, and they without difficulty persuaded others to ship on board the *Barbara*.

Our first officer, Mr. Randolph, was a gentleman in the main, and a very pleasant companion, though he had at first sight, in his every-day working suit, that scarecrow look which tall gaunt men, who have been somewhat battered by wind and weather, are apt to get. Our second mate, Ben, or rather "Benjie" Stubbs, as he was usually called, was nearly as broad as he was long, with puffed-out brown cheeks wearing an invincible smile. He was a man of one idea; he was satisfied with being a thorough seaman, and was nothing else. As to history, or science, or the interior of countries, he was profoundly ignorant. As to the land it was all very well in its way to grow trees and form harbours, but the sea was undoubtedly the proper element for people to live on; and he seemed to look with supreme contempt on all those who had the misfortune to be occupied on shore. The third mate, Henry Irby, had very little the appearance of a sailor, though he was a very good one. He was slight in figure, and refined in his manners, and seemed, I fancied, born to a higher position than that which he held. He had served for two years before the mast, but his rough associates during that time had not been able

in any way to alter him. Our surgeon, David Gwynne, was, I need scarcely say, a Welshman. He had not had much professional experience, but he was an intelligent young man, and had several of the peculiarities which are considered characteristic of his people, but I hoped from what I saw of him when he first came on board that he would prove an agreeable companion. Curious as it may seem, there were two men among the crew who by birth were superior to any of us. I may, perhaps, have to say more about them by-and-by. We mustered, officers and men, forty hands all told.

I will pass over the leave-takings with all the dear ones at home. I knew and felt that true prayers, as well as kind wishes, would follow me wherever I might go.

"James," said my kind employer as I parted from him, "I trust you thoroughly as I would my own son, if I had one. I shall not blame you if the enterprise does not succeed; so do not take it to heart, for I know that you will do your best, and no man can do more." Mr. Thursby considered that it was incumbent on him to take a dignified farewell of me, and to impress on me all the duties and responsibilities of my office; but he broke down, and a tear stood in his eye as he wrung my hand, and said in a husky voice, "You know all about it, my dear boy, you'll do well, and we shall have you back here, hearty and strong, with information successfully to guide Garrard, Janrin, and Co., in many an important speculation; and moreover, I hope, to lay the foundation of your own fortune. Good-bye, good-bye; Heaven bless you, my boy!"

I certainly could not have commenced my undertaking under better auspices. Having obtained the necessary permission of the Honourable East India Company to trade in their territories, the *Barbara* proceeded to Spithead, and I ran down to pay a flying visit to my friends, which was the cause of my joining the ship at Spithead in the way I have described, and where I left my readers to give these necessary explanations.

The convoy was standing on under easy sail to allow the scattered vessels to come up, and as long as there was a ray of daylight they were seen taking up their places. Now and then, after dark, I could see a phantom form gliding by; some tall Indiaman, or heavystore-ship, or perhaps some lighter craft, to part with us after crossing the line, bound round Cape Horn. The heat was considerable, and as I felt no inclination to turn in, I continued pacing the deck till it had struck six bells in the first watch.* Mr. Randolph, the senior mate, had charge of the deck. He, I found, was not always inclined to agree with some of the opinions held by our captain. "He's a fine fellow, our skipper, but full of fancies, as you'll find; but there isn't a better seaman out of the port of London," he observed as he took a few turns alongside me. "I have a notion that he believes in the yarns of the Flying Dutchman, and of old Boody, the Portsmouth chandler, and in many other such bits of nonsense, but as I was saying—"

"What, don't you?" I asked, interrupting him; "I thought all sailors believed in those tales." The captain had been narrating some of them to us a few evenings before.

"No, I do not," answered the first mate, somewhat sharply. "I believe that God made this water beneath our feet, and that He sends the wind which some-

* The ordinary watch consists of four hours, and the bell is struck every half hour. As the first watch commences at eight, it was then eleven. There are two dog-watches from four to six and from six to eight, p.m., in order that the same men may not be on duty at the same hours each day.

times covers it over with sparkling ripples, and at others stirs it up into foaming seas, but I don't think He lets spirits or ghosts of any sort wander about doing no good to any one. That's my philosophy. I don't intend to believe in the stuff till I see one of the gentlemen; and then I shall look pretty sharply into his character before I take my hat off to him."

"You are right, Mr. Randolph, and I do not suppose that the captain differs much from you. He only wishes to guard against mortal enemies, and he has shown that he is in earnest in thinking that there is some danger, by having come on deck every half hour or oftener during the night. There he is again."

Captain Hassall stood before us; "Cast loose and load the guns, Mr. Randolph, and send a quarter-master to serve out the small arms to the watch." He said quietly, "There has been a sail on our quarter for some minutes past, which may possibly be one of the convoy, but she may not. Though she carries but little canvas she is creeping up to us."

The mate and I while talking had not observed the vessel the captain pointed out. "The skipper has sharp eyes," said the first mate, as he parted from me to obey the orders he had received. Our crew had been frequently exercised at the guns. Having loaded and run them out, the watch came tumbling aft to the arm chest. Cutlasses were buckled on and pistols quickly loaded, and boarding pikes placed along the bulwarks ready for use. The men did not exactly understand what all this preparation was for, but that was nothing to them. It signified fighting, and most British seamen are ready for that at any time. The captain now joined me in my walk. "It is better to be prepared, though nothing come of it, than to be taken unawares," he observed. "It is the principle I have gone on, and as it is a sound one, I intend to continue it as long as I live." I agreed with him. We walked the deck together for twenty minutes or more engaged in conversation. His eye was constantly during the time looking over our starboard quarter. Even I could at length distinguish the dim outline of a vessel in that direction. Gradually the sails of a ship with taut raking masts became visible.

"That craft is not one of our convoy, and I doubt that she comes among us for any good purpose," exclaimed the captain; "I should like to bring the frigate down upon the fellow, but we should lose our share of the work, and I think that we can manage him ourselves. Call the starboard watch, Mr. Stubbs."

The men soon came tumbling up from below, rather astonished at being so soon called. The other officers were also soon on deck. Mr. Randolph agreed that the stranger, which hung on our quarter like some ill-omened bird of prey, had an exceedingly suspicious appearance, and that we were only acting with ordinary prudence in being prepared for him.

"The fellow wont fire, as he would bring the frigate down upon him if he did," observed the first mate; "he will therefore either run alongside in the hopes of surprising us, and taking us by boarding before we have time to fire a pistol, which would attract notice, or, should the wind fall light, he may hope to cut us out with his boats."

Eight bells struck. We could hear the sound borne faintly over the waters from two of the Indiamen to windward of us, but no echo came from the deck of the stranger. The men were ordered to lie down under the bulwarks till wanted. Had Captain Hassall thought fit, we might, by making sail, have got out of danger, but he had hopes that instead of being taken by the stranger

he might take him. It struck me that we might be running an unwarrantable risk of getting the vessel or cargo injured by allowing ourselves to be attacked.

"Not in the least," answered the captain; "we serve as a bait to the fellow, and shall benefit directly by catching him. If we were to give the alarm he would be off like a shot, and depend on it he has a fast pair of heels, or he would not venture in among us, so that the frigate would have little chance of catching him."

The truth is, Captain Hassall had made up his mind to do something to boast of. Orders were now given to the men to remain perfectly silent; the stranger was drawing closer and closer; grappels had been got ready to heave on board him, and to hold him fast should it be found advisable. It was, however, possible that his crew might so greatly outnumber ours that this would prove a dangerous proceeding. As to our men, they knew when they shipped that they might have to fight, and they all now seemed in good heart, so that we had no fear on the score of their failing us. Our officers were one and all full of fight, though each exhibited his feelings in a different way. The surgeon's only fear seemed to be that the stranger would prove a friend instead of a foe, and that there would be no skirmish after all.

"She's some craft one of the other vessels has fallen in with, and she has just joined company for protection," he observed. "For my part I shall turn in, as I am not likely to be wanted, either to fight or to dress wounds."

The wind, which had much fallen, had just freshened up again. "Whatever he is, friend or foe, here he comes," exclaimed Mr. Randolph. "Steady, lads," cried the captain, "don't move till I give the word."

As he spoke the stranger glided up, her dark sails appearing to tower high above ours. We kept on our course as if she was not perceived. With one sheer she was alongside, there was a crash as her yards locked with ours, and at the same moment numerous dark forms appeared in her rigging and nettings about to leap on to our deck. "Now give it them," cried our captain. Our men sprang to their feet and fired a broadside through the bulwarks of the enemy. The cries and shrieks which were echoed back showed the havoc which had been caused. Shouts and blows, the clash of cutlasses, the flash of pistols immediately followed. I felt a stinging sensation in my shoulder, but was too excited to think anything of it as I stood, cutlass in hand, ready to repel our assailants. Many of those who were about to board us must have sprung back, or fallen into the water; a few only reached our deck, who were at once cut down by our people. One man sprang close to where I stood. I was about to fire my pistol at him, when I saw that he was unarmed, so I dragged him across the deck out of harm's way. The next instant the vessels parted.

"Give it them, my lads! Load and fire as fast as you can, or they will escape us," cried the captain in an excited tone. "Wing them! wing them! knock away their spars, lads!" He next ordered the helm to be put down, the tacks hauled aboard, and chase to be made after our flying foe, while a blue light was burned to show our locality, and to prevent the frigate from firing into us when she followed, as we hoped she would.

We had no doubt that the enemy, when he met with the warm reception we had given him, took us for a man-of-war corvette, and on this came to the conclusion that prudence was the best part of valour. There could be little doubt, however, that he would soon dis-

cover that our guns were of no great size; and then possibly he might turn on us, and give us more of his quality than would be desirable. Still we kept on peppering away at him as fast as we could, in the hopes of bringing down one of his masts, and enabling the frigate to come up. The lights of the convoy were, however, by this time almost lost sight of. In vain we looked out for a signal of the approach of the frigate. No gun was heard, no light was seen. We were afraid of losing the convoy altogether, and certainly it would have been against the spirit of our instructions to have attempted to deal single-handed with our opponent. Giving the enemy a parting shot most reluctantly, Captain Hassall therefore ordered the helm to be put up, and we ran back in the direction in which we expected to find the convoy.

PETTY CHEATING.

We lately read in a morning paper an account, all too brief and generalised, of more than three-score tradesmen, some of them occupying prominent and "respectable" positions in a certain district of London, all of whom were had up before the magistrates in one day, and fined for using false and fraudulent weights or measures! It is satisfactory to find that the rogues were brought to book and punished; but it is not satisfactory, and not at all right or just, that the names and addresses of these dishonest people should be suppressed. All such offenders should be posted ignominiously in sight of all men, in order that those who deal with them should know with whom they have to do.

It is mortifying to learn that this method of cheating is continually on the increase, and one's indignation fires up on reflecting that it is the humbler and struggling classes who are for the most part the victims of it. One article in which the poor man is victimised continually is that of tobacco. Buying his tobacco in very small quantities, he gets it handed to him ready packed and weighed—in ounces, or half or quarter ounces. But does he often get fair weight in these minute packages? For the sake of information on this point, we lately entered a shop much frequented by labouring men on Saturday night, and brought away three half-ounce packages of "bird's-eye." On weighing them scrupulously without the envelopes, it appeared that, according to shopkeepers' reckoning, there are three half-ounces to an ounce—the whole of the tobacco barely balancing an ounce in the scale. We might be told, perhaps, that all tobacco is moist when taken from the barrel, and dries in paper packets; but fifty per cent. is a rather large allowance for moisture. We might be told, also, that the purchaser of any quantity, however small, can see it weighed if he chooses; but what if the weights are false, like those of the three-score offenders mentioned above?

Then, in the matter of his beer, the poor man is cheated both as to quality and quantity. In the first place, the London publican is given to poisoning the beverage with drugs—doctoring it, as it is professionally termed—by which process it is increased largely in quantity, and so altered in its constituents as to excite thirst instead of quenching it. In the second place, it is often drawn from the tap in pots of short measure—either in the shape of fancy pots that never pass beyond the bar, or in others ingeniously, though to all appearance accidentally, bulged inwards, so that their containing capacity is profitably diminished.

The peripatetic trades of London find their customers

for the most part among the lower middle classes and the poor; and of many of these traffickers it may be said that cheating in some form or other is their normal system of doing business. It would seem that the weights and measures of the out-door traders, are not subject to the supervision of the inspectors—at any rate, we never hear of these gentry being brought to account for their exploits. A pound of cherries bought from a handcart in the street is rarely found to weigh a dozen ounces; oftener, indeed, it may weigh eight or nine. The so-called pound weight of the street fruit-seller is a nondescript lump of metal, manufactured for the purpose, and has no definite relation to a pound avoirdupois, unless in appearance. In selling fruit by measure there is the same sort of sophistication. False wooden bottoms are common, as the buyers of nuts know well. If the measure is correct, which is assuming a great deal, the method of filling it is a delusion. A practised hand will fill a quart pot with a pint of plums or gooseberries, and make it appear as though it were brimful and running over. Watch him narrowly, and you will see how he does it. He lays the measure horizontally, and covers the lower side with fruit; then raising the measure gradually, he heaps a handful of fruit over the top with his left hand; at the same time having a good-sized plum, say between the finger and thumb of his right hand, he ingeniously inserts that as a kind of key-stone to prevent the crowning heap from falling into the hollow beneath: thus the measure appears choke full and filled up, though something like half the due quantity is lacking. This clever piece of cheatery is executed with astonishing rapidity—two seconds, we should say, affords ample time for it. When the measure, as in the case of strawberries and raspberries, goes with the fruit, the cheating, as everyone knows, consists in filling the lower half or more of the pottle or punnet with some worthless material—grass, hay, fern leaves, or anything that comes to hand—so that half a pint of the fruit shall look like a pint, or a pint like a quart. It would appear that the summer fruits never have been honestly sold in the London streets. We can remember well the occasion on which we bought our first pottle of strawberries in a street in Paddington—*O mihi preteritos!*—it was more than fifty years ago—and the grievous indignation we experienced on finding that the middle and lower strata of the deceitful measure consisted of nothing but fusty grass. It was our first introduction to the rascality of trafficking human nature. Would it had been the last!

But we can trace this phase of cheating much farther back than fifty years ago. There is an old book known by curious readers as the "Diary of Henry Machyn, Merchant Taylor of London," written in 1552, in which there is a record of a man who was placed in the "pelere" for "selling potts of straberries, the whych the pott was not alf fulle, but fylled with ferne (fern)." This brief record is more creditable to our ancestors than any truthful record of similar matters in our day would be to us. The cheat of three hundred years back, it is evident, was regarded and treated as a rogue, and his cheating punished as a crime. We moderns have changed all that, and should no more think of punishing the trader who cheats than the member of Parliament who bribes—though why both of them should not be well trounced is not so clear.

A singular phase of cheating, which makes its appearance in London about the fall of the leaf, and is at its height in the mellow month of October, is one known among adepts as "coming the double," which is effected by a kind of sleight of hand, so cleverly managed as to

deceive the most watchful eye. Some fine morning in October, you hear a sonorous voice in the street bawling out "Fine bilin' happles! yaa! fine keepin' happles—russetin's yaa! half-a-crown a hunder!" You know you would like a winter stock of apples, and you send Betty to the door to see what sort of fruit the man has got. She brings you in a sample in her apron—good plump specimens, big enough for dumplings. You decide on buying a hundred of them, and while Betty goes in search of a basket to contain them, the man and boy lug their huge hamper into the hall in readiness. Then, as you sit at your work or book, you hear them counted out—"five, ten, fifteen, twenty," and so on, till the hundred is told, the money is paid for them, and the hawker goes roaring on his way. Now if you are not a very thrifty personage, and do not count over these apples yourself before you store them away, you will hear very soon that they are all gone, and will be puzzled to imagine what has become of them. If you do count them, however, you will find that, instead of one hundred apples, you have little more than half the number—the ingenious messenger of Pomona has been "coming the double" over you, and for every apple he has given you has made you pay for two. Nay, we have known instances in which the double has been so dexterously done that the total result of the counted-out hundred was not one over fifty—but such a case is exceptional, and may be regarded as a touch "beyond the reach of art." You are, perhaps, inclined to blame Betty for her stupidity in suffering herself to be defrauded; but allow us to assure you that the result would have been precisely the same had you consummated the transaction yourself. The exploit is accomplished in the following way:—The accomplished "doubler" adjusts the edge of his hamper over the purchaser's basket, and, bending over the wares, takes five apples in the hollow of both his palms: the first five go into the basket, and the second and subsequent fives appear to follow with astonishing rapidity; but so dexterous are the man's movements, and so delusive is the swift motion of the fruit, that although one half or more of the apples he takes up go back again into his own hamper, you are not only not aware of it, but, when the thing is well done, have not the remotest suspicion of the fact.

The grocer may be regarded, in all districts where the poorer classes most abound, as the poor man's provision merchant—the commerce of poor families with the butcher being but comparatively small. But grocers' wares are unfortunately subjectible to admixtures and falsifications to a greater extent than almost any other. Sugar will carry a rare amount of moisture as well as of solid matters not saccharine; tea may be subjected to infusion, and dried and rolled and infused again a dozen times over—a capacity which has created a race of industrials, known as tea-leafers, who live by preparing it again for the market after all its strength has been exhausted; and coffee may be imitated by a dozen roasted substitutes, and made saleable by flavouring with chicory. It is the same with condiments and provocatives: the poor man's pepper is often half dust; his mustard is three-fourths maize or lentil-flour; his vinegar is half water; his pickles are gone dead and artificially preserved from corruption; and his anchovies, if he thinks of indulging in anchovies, are manufactured from a redundant overflow of sprats. The wholesale cheating practised upon the poor is sometimes rebuked in an indignant strain by editors of newspapers: while we write, a paragraph is going the round, exposing the tricks of the butter trade, from which we learn that a large proportion of the so-called

butter sold to the poor, and sold nominally as the over-plus of the market, at a comparatively low price, is not butter at all. It is, in fact, a preparation of beef suet, beaten up with a liberal per-centage of water, and coloured with anatto, the mass being well salted to save it from putrefaction.

In towns where large numbers of working men are employed, and where their families form the major portion of the population, the provision-dealers usually assume a sort of vested right in them, fleecing them systematically, and supplying them with wares often of the very vilest quality at high prices. In a town, which for this time shall be nameless, where the intolerable peculations of the retail shopkeepers had risen to a shameless height, and where some thousands of workers are employed on Government work, certain influential friends of the artisan established small stores on the canteen system, where the workmen and their wives could purchase goods of fair quality at a fair price. It is no wonder that not only the Government workmen, but other inhabitants of the place, took advantage of a just market, and flocked to the canteens to purchase their daily supplies. But mark a characteristic fact: the shopkeepers, finding themselves deserted by those whom they had been accustomed to regard as their lawful victims, actually sent one deputation after another to the Minister of War, to represent to his lordship the injury which would thereby be done to their vested interests in the servants of the British Government, and they made special complaints of the unfairness and impropriety of allowing civilians also to deal at the canteens, with the object of obtaining better weight and better wares at a fairer price than they could do at the small shops of the town. We do not hear that his lordship, who must have derived from the deputations some novel ideas of commercial morality, complied with their joint requests; but we do hear, on the contrary, that the traders, finding they could do no better, reformed their system, and, by selling honest wares at a fair price, were enabled to compete successfully with the canteens, and thus to recover their lost trade, at least in part.

With regard to other necessities of life there is the same complaint to be made. Whenever the poor man has to be served, the "shoddy" principle comes into play: his furniture, though when new it may shine with lacquer and French polish, is often made with "slab" and refuse timber: the inferior leather, which will not do for the average market, is made to do for him; the coarse garments of the slop-seller, who supplies him with clothing, are in good part manufactured from materials which have already run their course in some other shape; and we all know that, while he pays more for house-rent, in proportion to the accommodation he gets, than the rich man does, he is housed in the vilest way, and has to brave pestilence in a thousand shapes, because he is deprived of the commonest safeguards against it.

For a large proportion of the cheating and impositions of which they are the victims, the humbler classes have themselves to blame. They have allowed themselves too easily to become the dupes of the dealers, tallymen, and others who exact unreasonable profits; they spend their money, even in their prudential purchases, with far too much recklessness and haste, and usually without knowing or caring to know the real characters of the parties with whom they transact business. In a word, they do not take that care of their own interests which they might take, and which people in the ranks above them usually do take.

"OUR FATHER WHO ART IN HEAVEN."

SWEET sound the voices of the children, calling
And laughing at their play;
They know no wearying thro' the long, warm hours
This summer day.

Sometimes there is a transient cry of wailing
When one has crost
Too far into the bosky garden bowers,
And there seems lost.

Sometimes there is a gush of tears and weeping
For childish pain:
It swiftly ends, and leaves, like summer showers,
All clear again.

The day ends, and they hear the father calling
To play no more:
They leave their games, and each one for the fastest
Runs to the door.

Soon in their little beds they lie, not knowing
How the world wins
Its way thro' clouds of darkness, care, and sorrow,
Sighings and sins.

For them, enough that soft white sheets and pillows
Close round them warm,
And overhead the strength of the home-roofing
To shield from storm.

For them enough that parents' breath and kisses
Have touched their face;
And that to-morrow sunshine will be streaming
About the place.

* * * *

Oh Father, dwelling in Thy House of Heaven,
Behold us here;
Our playtime changed, indeed, for life's sore burden,
Its pain and fear.

For some the holding of ships' helms, storm-driven
On stormy seas;
The sultry gleaning midst the harvest stubble,
Afar from trees.

For some the brooding over desks and ledgers,
Where cities smoke;
The feeding furnaces, where roofs clang ringing
To hammer-stroke.

For some the delving in the pit or quarry,
The dusty loom,
The needle-labour where they sew the dresses,
And for the tomb.

For all, the sense of weariness and terror—
The strife within—
The poisoned whisper of the serpent, urging
The heart to sin.

Oh Father, standing at the door of Heaven,
Thy children call;
Draw us to hear, amid our work and weeping,
Thy voice in all.

Enough for us to know Thou dost forgive us,
And take us back,
When once repentant, tho' we far had wandered
From wisdom's track.

Enough for us to know Thou art about us,
That Thou art good;
Giving the safety, strength, and succouring shelter,
Raiment and food.

And when they lay us quiet in the grave-yard,
'Twill be a sleep
O'er which, as o'er the lifetime Thou wilt watch us,
And kindly keep.

And some day—when Thou knowest—we can wait it,
Our time is Thine,
Across the casements of our gloomy chamber
A light will shine.

And we shall wake, like children in the morning,
All fresh and fair,
To face the glory of the life immortal
Glad dawning there.

We are Thy children. And Thou art our Father;
Home is in store.
He told us so—Thy Son: we trust His telling,
And want no more.

A. N.

THE MIDNIGHT SKY AT LONDON: JULY.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

THE principal constellations in the southern half of the midnight sky on July 15, are Lyra, Aquila, Serpens, Ophiuchus, Capricornus, Aquarius, Pegasus, with considerable portions of Hercules, Cygnus, Corona Borealis, Pisces, and Cetus. Several first-class stars are now included in the lower diagram, such as Altair, Vega, Deneb, Ras Alague, and Markab. The immediate zenith is within the constellation Cygnus, whose chief star, Deneb, is now distant from that point by a few degrees only. Below Deneb are several bright stars of the third magnitude, most of which belong to Cygnus. The star nearest to Deneb, but slightly closer to the meridian, is Gamma Cygni, the next in order downwards, towards the south-east, is Epsilon Cygni, and the third, or lowest of the three, is Zeta Cygni. Pegasus is below Cygnus in the same direction, and lower still, reaching to the horizon, Aquarius is situated. If we draw an imaginary line from Deneb across Zeta Cygni, it will pass, at nearly the same distance, through Epsilon Pegasi, or Enif, a bright star between the second and third magnitudes. If this line be carried on a little farther, it points out Alpha Aquarii, or Sadalmelik, the principal star in the sign Aquarius. Between Pegasus and the meridian, two small constellations, Equuleus and Delphinus, may be noticed the latter being

easily recognised by a group of moderately-sized stars. Looking due east, or rather south of east, at some distance below Deneb, or towards the left-hand of the upper part of the diagram, the eye will fall on several large stars in Pegasus, the nearest to the zenith being Beta Pegasi, or Scheat, and that nearest to the horizon Gamma Pegasi, or Algenib. Alpha Pegasi, or Markab, is the most southerly of these bright stars. These three objects, added to Alpha Andromedæ, or Alpherat, which, in this month, is included in the upper diagram, form the well-known group called the square of Pegasus. The actual horizon in the east is occupied by a part of Cetus. Capricornus is south-east of Aquila, approaching the meridian, but it contains no prominent stars. On or very near the meridian, the chief stars worthy of notice are those composing the distinctive group in the breast or neck of the Eagle, Alpha, Beta, and Gamma Aquilæ. The central star of the three is Alpha, or Altair, and is between the first and second magnitude, the uppermost star is Gamma, and the lowest Beta, which is also the smallest. Other stars in Aquila can be noticed slightly west of the meridian. Beta Cygni, or Albiero, between the Aquila group and the bright stars in Lyra, is a remarkable double star, celebrated for the brilliant colours of its components. The

intermediate space between Aquila and Beta Cygni is occupied by Vulpecula and Sagitta. The sky near the south horizon contains portions of Piscis Australis and Sagittarius.

The western division of the south sky, a considerable portion of which will be below the horizon next month, contains the constellations Lyra, Ophiuchus, and Serpens, with parts of Hercules, Corona Borealis, Cygnus, Aquila, Sagittarius, Scorpio, and a few others. With

INDEX-MAP, LOOKING NORTH, JULY 15

the face directed to the south-west, the first object from the zenith is Vega, south of which are the two stars Beta and Gamma Lyræ. About midway towards the horizon, we recognise Ras Alague, and the other principal stars in the constellation Ophiuchus, which extends nearly to the extreme limit of view. The horizon, south-west of Ophiuchus, contains several stars in Scorpio on the point of setting. Antares is invisible. Due west, below Vega, a considerable space is covered by Hercules; but a part of this constellation has passed into the northern half of the sky. Corona Borealis is also due west of the zenith; its principal star Alphecca, with three others of the semicircular group, can be found on the right-hand side of the upper part of the diagram, on the point of passing into the northern half of the sky. The remaining members of the group, with

INDEX-MAP, LOOKING SOUTH, JULY 15.

several other stars in this constellation, have already passed into the northern half, and will consequently be found in the upper view. It may not be amiss to state again in this place, that the upper part of the lower view coincides with the upper part of the upper view, so that were the two diagrams joined together in this way, the

representation of the heavens from north to south would be given, excepting only those parts near the eastern and western horizon, the zenith, or point over head, being exactly in the centre. Below Hercules, approaching the western horizon, all the stars in Serpens are still visible, also a few in Virgo, although they are within a half an hour of setting. On the whole, the south midnight sky in the middle of July is fairly attractive, excepting in the constellations south of the equator, where there is scarcely a star at this time above the third magnitude. This scarcity of brilliant objects in the lower part of the south sky is amply compensated by the brilliant appearance of the principal stars in Lyra, Cygnus, Aquila, and Pegasus, most of which are now in conspicuous positions.

Lyra, the Harp, one of the old forty-eight constellations, is of very limited extent, but it contains, nevertheless, several important objects, including Vega, one of the brightest stars in the northern hemisphere. Lyra is situated to the south-east of the head of Draco, having Hercules on the west and south, and Cygnus on the east. This small constellation contains about twenty stars visible to the naked eye, but Bode has included one hundred and sixty-six in his celestial atlas, the majority being of course telescopic. The isolated position of Vega, with respect to other very large stars, is so well known that it is scarcely necessary to give any special alignment. It may be, however, as well to state that a line drawn from Arcturus through Corona Borealis leads directly to the Swan, and in its course passes over Lyra. A large right-angled triangle is also nearly formed by the stars Vega, Arcturus, and Polaris. Also the three stars in the neck of Aquila point directly to it. Vega is accompanied by a small telescopic star at a short distance, and some minute objects have been suspected to be very close to the principal star in whose rays they are lost. According to some experiments made by M. Laugier on the relative intensity of the light of the stars, that of Vega was found to be greatly inferior to that of Sirius, although it was placed by him second on the list. M. Siedel, however, from similar experiments, but by a different method of investigation, placed it third in order of lustre. Dr. Wollaston had previously published the results of his researches on the comparative intensity of the light of the sun, moon, and stars, from which he concluded that the intrinsic brightness of Vega is only one-ninth part of that of Sirius. Sir John Herschel, including the stars in both hemispheres, places the relative brightness of the principal stars in the following order: Sirius, Canopus, Alpha Centauri, Arcturus, Rigel, and Vega. Of these, Canopus and Alpha Centauri are not visible in this country. When near the meridian, Vega certainly appears intensely brilliant through a telescope, at which time it forms a great contrast to the humble light of its small companion. This star, valuable as it is at present to the navigator, will be infinitely more so in future ages, when it will be, both in position and lustre, the polar gem of the northern hemisphere. It will then be apparently stationary, like our present Polaris, with respect to the horizon. The intensity of the light of Vega is sufficiently great to enable anyone to observe it with ordinary telescopes during any part of the day or night throughout the year, excepting only for a very short time when it is in the north horizon, where even it can be occasionally observed on very clear nights. Vega, Deneb, and Altair form that well-known triangle by which the three stars are generally identified in the sky.

E

THE MIDNIGHT SKY AT LONDON, LOOKING NORTH, JULY 15.

E

W

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, JULY 15.

Beta Lyrae, a star of the third magnitude south of Vega, and a little west of Gamma Lyrae, of a similar size, may be found by drawing a line from Vega towards Altair, when it will pass between these two stars. Beta Lyrae is accompanied by a companion of the eighth magnitude, and by two smaller ones at a greater distance. There does not appear to be any evidence of a physical connection between them. The magnitude of Beta has been found to be slightly variable. Epsilon Lyrae is a very curious star, and is what may be termed a double-double star. It is situated on the frame of the Harp, a short distance north-east of Vega when on the meridian. To the unassisted eye it appears of the fifth magnitude, but when viewed through a telescope it is separated into two systems of stars, each system being a fine binary pair. Between the two sets three or four very faint stars can be noticed. Admiral Smyth remarks in his "Cycle," that these stars form a fine subject for contemplation; "the two sets resembling each other so closely in magnitude, distance, orbital retrogradation and proper motions, as to afford palpable evidence of their forming a twin system; and a combined rotation about a common centre of gravity may be suspected." When contemplating interesting groups of this kind no observer can really believe that these apparently small objects which seem to be so dependent upon one another for their uniformity of motion, have been placed in their respective positions in the universe without some high purpose, of which we are profoundly ignorant. One thing we do know is, that they have not the slightest influence on our solar system, nor are they useful to man as ornaments of our skies, especially those minute objects which are only visible through good space-penetrating telescopes. There are several other stars of this class in Lyra, double, triple, and quadruple, but there are none of so interesting a character as the group composing Epsilon Lyrae.

Hercules is a constellation of great extent and importance, although it contains no star greater than the third magnitude. It joins Draco on the north, Lyra on the east, Ophiuchus on the south, and Serpens and Corona Borealis on the west. By the absence of stars of the first and second magnitudes Hercules is not so remarkable to the naked eye as many other asterisms, but, telescopically, it is a very interesting constellation from the numerous double stars, clusters, and nebulae contained within its boundaries. In the star-catalogues of Ptolemy, Tycho Brahe, and other astronomers who flourished before the invention of the telescope, about thirty stars in Hercules have been inserted, all of which are observable without optical aid. In Bode's atlas, four hundred and fifty-one are included, most of which are telescopic. The principal star is Alpha Herculis, or Rasalgeti, one of the most lovely double stars in the heavens; the chief component being about the third magnitude and of an orange colour, while the companion, which is very close, is of the sixth magnitude and of an emerald or bluish green colour. Rasalgeti varies in brightness to a small extent. In the lower diagram it can be noticed a short distance north-west of Ras Alague, or Alpha Ophiuchi. As Ras Alague, Altair, and Vega nearly form an equilateral triangle, the position of Rasalgeti as well as that of Ras Alague can be easily found, each star being respectively in the heads of Hercules and Ophiuchus.

"Amid yon glorious starry host, that feeds both sight and mind,
Would you the Serpent-bearer's head, and that of Hercules find,
From Altair west direct a ray to where Arcturus glows,
One-third that distance, by the eye, will both these heads disclose."

Among the numerous double stars in Hercules, the

most interesting is Zeta, of the third magnitude. The companion is of the sixth. Zeta Herculis is situated near Epsilon, of the same size, between Alphecca, in Corona Borealis, and Vega. It is a very close binary, and for many years appears only as one star, even in superior telescopes. Its duplicity was first discovered by Sir William Herschel, in July, 1782. Thirteen years after he again saw it as a double star; but within a short period of that date it became apparently a single object of a wedge-like form, when viewed on favourable occasions with the great forty-foot reflecting telescope. The disappearance of the companion was considered by Sir William Herschel to be so curious that he made a remark at the time that "the observations of this star furnish us with a phenomenon which is new in astronomy, it is the occultation of one star by another." Zeta Herculis was again seen double in 1826, in which year it was observed at Dorpat by Struve. In 1840, it was easily separable in ordinary telescopes. In 1863 Mr. Dawes observed it as a single object; but in 1865, with his eight-inch refractor, he again saw the small star perfectly detached from the large one.

Ophiuchus, the Serpent-bearer, is one of the old forty-eight asterisms, and occupies at midnight, in July, a very large portion of the sky in the south-west, but although it is of so great an extent, it contains but few important stars. It is bounded on the north by Hercules, on the east by some small constellations, on the south by Scorpio, and on the west by Serpens. The last-mentioned constellation is, however, so entwined with Ophiuchus that a proper separation of the two is extremely difficult. Ophiuchus includes several clusters and double stars, one of the latter, 70 Ophiuchi, being a most interesting binary system. The components of this star revolve around one another in about 100 years. In 1604, a new star of great brilliancy suddenly appeared in the foot of Ophiuchus, but after shining for some time as bright as one of the first magnitude, it totally disappeared in a few months. At the present time no star within the limit of vision, even with the assistance of our largest astronomical telescopes, can be found near its place. The position in the heavens of Ras Alague, the principal star of this constellation, has been previously pointed out by alignment, but the following couplet may still be useful for its detection among the stars:—

"From Altair let a ray be cast, where we Arcturus view,
One-third that distance will reveal the star Ras-al-ague."

In the middle of July at midnight, if the observer places himself so as to command a view of the heavens north of the zenith, he cannot fail to perceive the amount of change which has taken place in the positions of the principal stars, with respect to the meridian or horizon, since the date of the June diagrams. The zenith is now included within the constellation Cygnus; but no conspicuous star in the north sky is nearer than Beta and Gamma Draconis, which were the two zenithal stars in June. These are, however, still nearly overhead a short distance due west, Gamma being the nearer star to the zenith. By looking directly towards the Pole star, and therefore along the plane of the north meridian, we pass near the confines of Draco and Cepheus; but the stars in this direction are not attractive, or likely to receive attention, till we reach Polaris, which is as usual in its nearly constant position. Below Polaris as far as the north horizon, there is absolutely no star worthy of special notice, that part of the sky near the meridian being now occupied by Camelopardus and Lynx, both of

which contain no star above the fourth magnitude, and very few above the fifth. But if, in July, the sky in the plane of the meridian contain such a paucity of bright stars, the brilliant objects in other portions of the heavens, both east and west, will make up for the deficiency in that direction. Taking the western side first, we have in view nearly the whole of Draco, Boötes, Canes Venatici, Coma Berenices, Ursa Minor and Ursa Major, and portions of Corona Borealis, Hercules, Leo Minor, and Lynx. Below Gamma and Beta Draconis, towards the W.N.W., a few of the chief stars in Hercules can be noticed, then those in Corona Borealis, beneath which is the greater part of Boötes, containing nearly all its principal stars, some of which, however, including Arcturus, are too near the western horizon to be included in the diagram. Nearly the whole of Ursa Minor is now west of Polaris. The space between the two Bears and almost to the seven chief stars of Ursa Major belongs to Draco. The position of the Ursa Major group is now on exactly the opposite side of the heavens to that exhibited in the January diagram. In that month Dubhe and Merak, the two leading stars in the waggon, are the nearest to the upper meridian, pointing in the direction of Polaris, with the shafts of the waggon directed to the north-east horizon. The heavens in July are viewed from the opposite part of the earth's orbit to that in which the earth was situated in January, a brief explanation of the effect of which was given in the description of the March diagrams, consequently Dubhe and Merak, followed by the remaining stars, are now approaching the lower meridian. Their relative positions to Polaris, however, remain the same. The stars in the Ursa Major group have thus made a seasonal change of half a revolution round the Pole, independently of their diurnal rotation in the same direction. If we make a general comparison of the January and July diagrams of the north sky, this seasonal change in the positions of the stars can also be easily seen in all the other circumpolar constellations. This comparison of the views for successive months will familiarise the appearances of the different groups of stars, and enable the observer to become acquainted with the general form of the principal groups in each constellation. Ursa Major occupies about one-third of the north-west sky at midnight in July. Canes Venatici, with its star Cor Caroli, can be seen below Alkaid, the last star in the tail of the Great Bear. Coma Berenices is above the horizon below Cor Caroli, but its stars are too faint to be visible.

In the north-east sky, where all the stars are hourly rising towards the upper meridian, we find the constellations Cepheus, Cassiopeia, Perseus, Triangulum, and Camelopardus, and portions of Cygnus, Andromeda, Pisces, Aries, Taurus, Auriga, and Lynx. Cepheus is slightly east of the meridian above Cassiopeia's group, below which all the stars in Perseus are visible. In the N.N.E., near the horizon, Capella and Beta Aurigæ can always be seen in July at midnight. On looking due east, the eye falls on Alpha Andromedæ, or Alpherat, rather more than half-way towards the horizon, forming one of the "corner stones" of the square of Pegasus. In the E.N.E., Alpha and Beta Arietis, the two chief stars in Aries, are about twenty degrees above the horizon.

The name of Cassiopeia has been derived from the wife of Cepheus, and the mother of Andromeda. This constellation is one of the most attractive groups of stars visible in the sky of London, and contains several stars of the second and third magnitudes. It is always

in direct opposition to Ursa Major, with respect to the Pole. For example, if Cassiopeia be at its greatest elevation, Ursa Major is near the horizon in the north, and *vice versâ*. If the Great Bear be in the east, Cassiopeia is in the west, and so on throughout their diurnal revolution. It is not difficult, therefore, to find Cassiopeia, for a line drawn from the middle of Charles's Wain, through Polaris, passes across the centre of the group. Cassiopeia is bounded by Cepheus, Perseus, Andromeda, and Camelopardus, and when passing the meridian above the Pole, it is directly overhead in all parts of the British Isles. The principal stars bear some resemblance to the letter Y with the vertical stem a little bent; or, by viewing it from another direction, to a badly-formed W; they have, however, frequently been called Cassiopeia's chair, imagination having transformed these five or six stars into the form of an antique seat.

Cassiopeia is celebrated as being the spot where a very remarkable temporary star appeared in November, 1572. It suddenly burst forth with a brilliancy greater than any star around it, and was therefore noticed by several persons about the same time. Tycho Brahe was one of these fortunate observers. From his own account, we gather that he was returning from his laboratory, on the evening of November 11th, when he saw a group of peasants gazing at a brilliant object, which he knew had not existed in that shape an hour previously. It was at first supposed to be a comet, though it had no distinctive marks of being one, but twinkled like any ordinary fixed star. It increased rapidly in magnitude, till it surpassed Sirius and Jupiter in lustre, and was even observed at noon-day. This great brilliancy, however, continued only for a short time, when it gradually diminished. In March, 1574, it became invisible to the naked eye, and has not been observed since. A severe scrutiny of the neighbourhood in which this wonderful star appeared has been made since the construction of the powerful astronomical instruments of modern days, but no trace of it can be found. La Place, the celebrated French mathematician and astronomer, was led to believe that the frequent change of colour which was observed in this star, first white, then yellow, afterwards reddish, and finally a bluish tint, showed that the sudden blazing forth was probably caused by the action of fire. This hypothesis was not, however, generally believed at the time. But since the sudden outburst of the star in Corona Borealis, which was noticed in our description of last month, many astronomers of the present day are

POSITION OF THE TEMPORARY STAR OF 1572.

inclined to believe that La Place's suggestion is not so improbable as it first appeared.

The July diagrams of the midnight sky will also represent the appearance of the heavens at 10 P.M. on August 15th, at 8 P.M. on September 15th, at 6 P.M. on October 15th, at 6 A.M. on April 15th, at 4 A.M. on May 15th, and at 2 A.M. on June 15th.

On July 15th, 1868, Jupiter and Saturn are both above the horizon, the former in the constellation Pisces, in the E.N.E., and the latter in Scorpio, near the south-west horizon. After this month Jupiter will become a conspicuous object, and will be the evening star for some time. He rises on the 1st at 11.47 P.M., on the 15th at 10.50 P.M., and on the 31st at 9.48 P.M. Saturn, though so near the horizon at midnight, will be visible in the early evening hours for some months longer. He sets on the 1st at 1.42 A.M., on the 15th at 0.46 A.M., and on the 31st at 11.38 P.M.; on the 31st he will be on the meridian at 7.10 P.M.—In July the planet Mercury is generally above the horizon during the daytime only, but on the 31st he rises an hour and a-half before the sun. He can be clearly observed by the aid of a telescope, and probably he may be recognised in very fine weather, soon after rising, near the north-east horizon, below Castor and Pollux.—Venus sets with the sun on the 10th, and, consequently, during July she will be invisible to the naked eye. Those, however, who are in possession of an astronomical telescope can see her within a day or two of inferior conjunction on the 16th, before and after which she will appear as a very narrow crescent, similar to a young moon of a day old. During the evenings of preceding months Venus has been the greatest ornament of the north-western sky, and in like manner, in following months she will be a brilliant morning star in the north-east and east, where she will continue for the remainder of the year.—Mars is in Taurus, rising on the 1st at 1.23 A.M., on the 15th at 0.54 A.M., and on the 31st at 11.33 P.M. He is near Aldebaran in the middle of the month, and can be distinguished from that star by the comparative steadiness of his light.—The telescopic major planets, Uranus and Neptune, are not favourably situated for observation.—The moon will be both an evening and morning object till the 13th, on which day she rises after midnight. She will be again visible in the evening on the 22nd, when she will appear as a fine crescent near the western horizon. Full moon takes place on the 4th at 8.39 P.M.; last quarter, on the 13th, at 0.41 A.M.; new moon on the 19th at 9.56 P.M., and first quarter on the 26th at 1.52 P.M. On the 7th she is at her greatest distance from the earth, and on the 20th she is nearest to us. The moon will be near Saturn on the morning of the 1st, and again on the evening of the 28th; she will also be near Jupiter on the morning of the 12th, the planet being to the left of the moon. At 2.29 P.M. on the 16th, she will pass over Aldebaran, but, being in daylight, the phenomenon can only be seen through very good astronomical telescopes. The star will emerge from behind the moon at 2.51 P.M. The observation of an occultation of a large star by the moon is a very striking one, especially at the dark limb, where the star is extinguished with startling suddenness. At the bright limb of the moon such a star as Aldebaran has been observed to hang apparently on the moon's edge before disappearance, and at times has been seen projected on the disk. These observations have been, however, very rare, and are supposed to have arisen from excessive irradiation, produced probably from some optical defect, either in the telescope employed, or in the eye of the observer.

H.R.H. THE DUKE OF EDINBURGH.

We have presented, from time to time, notices of the voyage of Prince Alfred, as commander of H.M.S. *Galatea*,* with extracts from private letters at various stations. About the very period when English readers were perusing the accounts of the cheerful doings at Christmas-tide and afterwards, on shore and "on board the *Galatea*," a crime was enacted which turned the scene of joy into sadness. The universal feeling, wherever the tidings of the dark deed came, is expressed in the address presented to the Queen by the Lord Mayor and Corporation of London, an address, similar in tone and utterance to the hundreds which were called forth from all classes of the loyal community. The presentation took place on May 13, the same day that Her Majesty laid the foundation stone of the new St. Thomas's Hospital, when special reference was also made to the dastardly attempt at assassination.

"Most Gracious Majesty,—We, the Lord Mayor, aldermen and commons of the City of London, in common council assembled, approach your Majesty's Throne with feelings of devoted loyalty to your Majesty's person and family.

"We have heard with mingled feelings of horror and indignation that an attempt has been made on the life of his Royal Highness the Duke of Edinburgh, while engaged, under your Majesty's orders, in the duties of his profession, and in cultivating feelings of loyal attachment among the inhabitants of distant colonies of this country.

"We feel certain that the only effect of such an atrocious crime must be to call forth fresh manifestations of that spirit of loving devotion to your Majesty's person and family which exists among all classes of your Majesty's subjects.

"We fervently pray that the same watchful Providence which guarded the life of your Majesty's son will long preserve your Majesty to reign over a dutiful and loving people."

To this address, as to many others, Her Majesty made a most gracious reply, joining in the heartfelt expressions of gratitude and of prayer, "that the same good Providence which preserved him from the assassin may soon restore him in health and safety to his family and country."

* A picture of the *Galatea* formed the frontispiece of the March Part of the "Leisure Hour."

THE MORTONS OF MORTON HALL.

CHAPTER XLVII.—CONCLUSION.

My story is nearly ended; a few words relative to the future history of my several *dramatis personæ*, and I have done.

For the sake of perspicuity, I have continued to speak of Mr. Henry Morton by his assumed name of Aston, although some time before Henry Talbot's return from America it had become generally known throughout the village of St. David that Mr. Aston's real name was Morton. It was long, however, before his true name came trippingly to the tongues of his friends, and many of the village folks spoke of him as Mr. Aston as long as he lived.

Early in the ensuing spring Mary Talbot and the Rev. Alfred Sharpe were married in the parish church of St. David. The marriage ceremony was performed by the rector, Mr. Sinclair, and despite the claim of her uncle to act in *loco parentis*, Doctor Pendriggen gave away the bride—the doctor jocosely insisting that since Mr. Sharpe had forestalled him in obtaining possession of the young lady's hand, he should at least claim the privilege of acting as her temporary father. Miss Wardour, and the daughter of Sir Charles Meldrum (the baronet and his family being at the time sojourning at the Grange) were bridesmaids on the happy occasion, and after their marriage, the youthful pair set out immediately to visit Mrs. Sharpe, the mother of the bridegroom, who, it is almost needless to say, was perfectly satisfied with her new daughter-in-law.

On their return, at the expiration of a month, to St. David, Mrs. Sharpe continued voluntarily to perform most of the duties she had heretofore performed as Mary Talbot, until, in course of time, an increasing family of children required her constant care.

Shortly after the return of Henry Talbot, Mr. Morton, whom I must now designate by his real name, revisited Fordham, together with his son and daughter, and nephew, not now as a mysterious stranger, but as the recognised and acknowledged proprietor of Morton Hall. The interview between him and Mr. Foley was unpleasant to both, for many reasons which will be sufficiently obvious to my readers; but, as Mr. Ferret had anticipated, the apparent readiness of Mr. Foley to recognise Mr. Morton's claim disarmed the latter of much of the indignation created by his cousin's unjust and cruel conduct towards his sister Mary. It was therefore generously conceded on the part of Mr. Morton that Mr. Foley should continue to reside at the Hall, and should receive during his life a moiety of the rental of the estates; but that on his decease the entire property should revert to the line of direct descent in the person of Henry Morton, jun., though the wife and children of Mr. Foley were liberally provided for, for their lives.

Old Matthew Budge was still living at the date of Mr. Morton's second visit to Fordham, and during the brief remainder of his life, the old sexton boasted of the excellence of his memory, which, as he averred, had enabled him to recognise Master Henry as soon as the latter entered the cottage, though he had never seen him since he was a boy of fourteen years of age. The old man lived to complete his hundred and fifth year, retaining his health and the use of his faculties to the last.

Eight years elapsed, however, before young Henry Morton took possession of his ancestral estates. His father, Mr. Henry Morton, senior, chose to live in quiet retirement at St. David. At length, to the great joy

of the people at Fordham, and to the satisfaction of the gentry of the country, all, rich and poor alike, the Hall was seen again in possession of a Morton; and shortly after this, the young squire married the daughter of a gentleman of the neighbourhood, who had been his grandfather's intimate friend.

During the period which elapsed between young Henry Morton's first visit to England, and his occupation of Morton Hall, he and his cousin Henry Talbot visited America. Henry Talbot having conceived a great liking for the Far West, Mr. Morton, senior, resolved not to sell his American property, as had been his intention, but to bequeath it at his death to his nephew and niece. Meanwhile Henry Talbot resided chiefly at Watertown in the capacity of his uncle's agent. He, however, frequently visited England, and on one of these occasions, he took back with him as his wife, his cousin, Mary Morton.

Two years after Mary Talbot's marriage, Miss Wardour became the wife of Captain Meldrum—the only son of Sir Charles—who had, about six months previously, returned from India, where he had been stationed for some years with his regiment. Captain Meldrum quitted the army on his marriage, and settled down at Meldrum Grange, which was presented to him and his wife as a wedding gift, by the old baronet. In course of time, Miss Wardour became Lady Meldrum; but long after her marriage she continued, living so near St. David, to take an interest in the village and its people; and between her and Mary Talbot, now Mrs. Sharpe, who continued to entertain a warm friendship for each other, the schools, and the sick and aged people of the village, were as well cared for after as they had been before the marriages of the two young ladies.

During twelve years from the date of Mary Talbot's marriage, little material change took place at St. David, at least among those of the inhabitants with whom my readers have become acquainted. At the end of this period, however, death began to do his work.

The venerable rector was the first to be called away to his eternal rest. He died, leaving his name and the memory of his goodness to live ever green amongst the descendants of the people, amidst whom he had lived so many years, and who had so greatly benefited by his deeds and teachings. To this day his memory is venerated, and he is ever spoken of with pride and affection at St. David. Mr. Henry Morton, senior, died four years after the decease of his friend the rector, at a good old age. He died at Cliff Cottage, where he had continued to reside ever since he first took possession of it, and, for six or eight years previous to his decease, he rarely quitted the village. He had, in spite of his eccentricities, made himself much beloved in consequence of his kindness to the poor, and his death was deeply lamented.

About the same time, old Mrs. Margaret, who two or three years before had sold her cottage at Hammersmith, and come to reside with Mr. and Mrs. Sharpe, at St. David, died in the ninety-fifth year of her age. Mary received the poor old lady's last sigh, and caused a tombstone to be erected in the village churchyard, commemorative of her loving faithfulness to the children of her former mistress, and of her faith and trust in God.

On the death of Mr. Morton, Mr. Sharpe became, through his wife—who inherited a large property from her uncle—a wealthy man, and he also acquired a small addition to his income at the decease of old Mrs. Margaret, who, true to her promise, left her two hundred

pounds per annum in the Funds, between Henry Talbot and his sister.

On the decease of Mr. Sinclair, Mr. Sharpe was presented with the rectorship of St. David, which he accepted in preference to the living he had for many years looked forward to—and which became vacant about the same time—both he and his wife having conceived an affection for the people amongst whom they had lived and laboured for so many years.

Jemmy Tapley lived to an extreme old age—a favourite to the last with high and low, rich and poor, and especially with the village children, whom he was ever willing to amuse with his sea yarns. His great pride, however, was to relate the part he had taken in removing suspicion from the honest fishermen of the village. He lies interred in the churchyard of St. David, where a moss-covered stone stands at the head of the ancient mariner's grave.

Doctor Pendriggen remained a widower to the end of his days, and died as he had lived, the only medical practitioner within fifteen miles of the village. With all his occasional brusquerie, the poor lost a kind friend when the honest, rough-spoken surgeon was removed by the hand of death.

Sir Arthur Lockyer went abroad again soon after his visit to Cornwall; but though he maintained an irregular correspondence with his old Eton schoolfellow for many years, I know little of his after career.

One little incident connected with my story remains to be explained. Shortly after Henry Talbot's return from America, his sister, while conversing with him over the troubles and anxieties she had endured during his absence, said suddenly—

"Tell me, Henry, why, in your first letter from America, you stated that you felt as though your misfortunes had been visited upon you in retribution for your wrong doing—or something to that effect? You cannot conceive what pain that expression caused me."

"Did I so write?" replied Henry. "I did not mean to cause *you* uneasiness, Mary. But I was so cast down when I first landed in America, that I *did* sometimes fancy that my misfortunes had befallen me as a punishment for having broken almost the last promise I gave my mother, viz.:—that I would never borrow what I had no certain means of repaying—that was all."

* * * * *

Many years have not, even now, passed away since the Rev. Alfred Sharpe and his wife—who died in the same year—were laid to rest in the vault of the parish church of St. David, where rest the remains of Mr. Sharpe's venerated predecessor. Their children still live to bless their memory, and the aged villagers still speak of the fair and gentle young governess who came to the village when they were children, and who lived and died the wife of their rector—who was the guide and instructor of their youth, and their supporter and comforter in sickness and trouble in after years.

And far away across the broad Atlantic, and many a hundred miles beyond the Atlantic's western shores—though no longer in "the Far West"—the children and grandchildren of Henry Talbot and Mary Morton dwell along the shores of the great lake Michigan—now no longer navigated merely by a few sailing craft, but crossed and recrossed by large and well-appointed steamboats, laden with produce and passengers from all parts of the world. Large and populous cities now occupy the sites of the small trading-posts, upon

which, long years ago, the weary way-worn traveller, Henry Talbot, gazed from the summit of the hill, rejoicing that he had nearly reached the end of his long journey, but little dreaming of the results his journey would bring about.

The children and grandchildren of the young Englishman are now the lords of the soil along the western border of the lake, and are Americans in heart and soul. Still they retain a fond recollection of their English ancestry, and proudly speak of the little island beyond the Atlantic as of "Home." When *they* speak of the Far West, they allude not to the place where they now reside, but to the land beyond the Rocky Mountain range, whose shores are laved by the waters of the Pacific, and from whose ports vessels now sail across the new highway to the farther Inde.

Reader, I have told my story.

Varieties.

BRITISH ASSOCIATION.—The meeting of the British Association for the advancement of Science holds its meeting for 1888 at Norwich, commencing Wednesday, August 19, under the presidency of Joseph Dalton Hooker, F.R.S., Curator of the Kew Gardens. A large meeting is expected, and important papers are announced. This year an innovation is to be made with regard to the excursions, which have heretofore unduly interfered with the business of the sections. The various excursions, geological, archaeological, and ethnological, are arranged to take place on the 27th August, the day after the work is over in the several sections. By this arrangement also a choice of excursions will be compelled, and less difficulty be experienced in procuring tickets, which have too often been secured by crowds of local associates, to the exclusion of members of the Association coming from a distance. Cromer, Holkham, Diss, Thetford, Hunstanton Cliffs, Castleacre, and Caistor Castle are among the places to be visited.

FEMALE MEDICAL PRACTICE.—Mrs. Isabel Thorne, of Charles Street, Grosvenor Square, presented herself at the recent Arts examination at Apothecaries' Hall, in company with sixty-six gentlemen. Out of the sixty-seven candidates forty-seven passed. Mrs. Thorne came out among the first six, and her papers were so excellent that the usual *vivâ voce* examination was dispensed with. Last May Mrs. Thorne finished the curriculum at the Ladies' Medical College in Fitzroy Square by carrying off double first honours in the medical and obstetrical classes.—*Athenæum*. [Our readers are indebted to Mrs. Thorne, formerly a resident in Japan, for the very interesting notes on Japanese life and manners appearing from month to month in the Leisure Hour.]

A LITERARY BANQUET.—There were oysters on the half shell, but these were the only things which had not been dignified with the odour of some literary name. There was *consommé à la Seigné*; there was *crème d'asperges à la Dumas*; there were *les petites Zimballes à la Dickens*; there were *truites à la Victoria*; *pap à l'Italienne*; there was *filet de boeuf à la Lucullus*; there was *agneau forcé à la Walter Scott*; and there were *cotillettes à la Fenimore Cooper*; and the *pièces montées*—"ornamental pieces"—were in all eight, of curious sugar manufacture, most of them labelled "Dickens" in very large red letters at the top and all stuck full of "Dickenses" in small "caps" and brevier from top to bottom. The first and most elaborate of these pieces was called the Temple of Literature, and presented some rather remarkable features. Here was a little sugar statuette at the top and by way of climax, which kept blowing an inaudible trumpet, and was undoubtedly meant as the Goddess of Fame. The deity of the hundred tongues was attired in tinsel of the latest fashion, thus typifying modern fame most particularly, and kept her eyes cast down very modestly in the direction of the name of Dickens, which was printed in large red "caps" upon the pedestal. The piece was composed of two columniated stories, the cornices of which were embellished with literary names rather curiously concatenated. Dickens, Addison, and Byron, with Shakspeare, poor dramatist, inserted between; Bacon, Bulwer, and Dickens, with Carlyle in red letters by way of bringing up the rear of the second division; and then Locke, Swift, and Savage, with Walter Scott, whose name made an ex-

cellent rear guard; and thus was completed the upper cornice. The lower cornice began with Goldsmith in red who seemed to slink frightened into the candy house in the presence of Johnson, his next neighbour; and then came Milton and Spenser, with Burns (not exactly a contemporary) waddling along in the rear of the author of the "Faery Queen." Next in order followed poor Wordsworth, who appeared to be intensely absorbed in the composition of some sort of an "excursion;" and then came Hume, with the little interrogation point, the petulant Pope, puffing along in the utter rear of the whole sugar-house party. The ornamentation included the following other pieces, the Temple of Literature forming the introductory:—Trophée à l'Auteur, Stars and Stripes, Pavillon International, Armes Britanniques, Loi du Destin, Monument de Washington, and Colonne Triomphale—all of which were specified in the bill of fare, but were not intended to be eaten, and thus escaped confiscation. About the main table, which was raised after the manner of a throne, were nailed the British arms, flanked on the one side by the Stars and Stripes, and on the other by the Cross of St. George; while opposite was placed the coat of arms of the United States flanked in the same manner. Bouquets were scattered here and there upon the several tables, which had been laid for one hundred and eighty-seven guests, including "Boz," who was the guest of all the guests of the occasion.—*New York Herald.*

MAY TEMPERATURE.—On the 19th May the thermometer in shade in many stations throughout England, stood at 85°. In some places the register reached to 87°. In the sun the maximum was 135°. The average mean temperature was 70° or 71°. According to Mr. Glaisher's tables, calculated from fifty years' observations at Greenwich, the mean temperature of the 19th May is 53.1, and of 15th July, the hottest day of the year, only 62.5. The average minimum reading in the early morning was 51.5, showing a range of 34°. The temperature is the highest that has occurred in May since 1833. Four years ago, May 18, 1864, the mercury reached 84° in the shade. On the night of the 19th thunderstorms were reported from various localities prefacing the great storm of May 29th.

BEGGING NUNS.—For years past the suburbs of London have been infested by mendicants in the guise of sisters of mercy. They work in couples, asking for the lady of the house, at hours when men of business are absent, and usually plead in behalf of some school or refuge "open to all creeds." Practice has made these mendicants adepts at persuasion; and if as successful in average calls as in some of which we have heard, enough money has passed through their hands to build many charitable institutions. As several convictions at police-courts have little abated the nuisance, householders are cautioned to make inquiry whether the persons are genuine sisters or counterfeit mendicants.

TENNYSON'S MAD LUCRETIUS.—Insanity may look well in a picture or as it sweeps across the stage—that is, so long as it appeals to the mere outward sense; but when it is presented to the imagination with all the details of a sympathetic analysis, when we are expected to lose ourselves in the chaos of a ruined intellect, we are afflicted with a pain which in the region of imagination is the counterpart of that aversion with which the smothering of Desdemona or the strangling of the Duchess of Malfi would afflict our senses. We shudder from the task of following the motions of reeling intellect. Those who have to do much with lunatics get accustomed to the play of lunacy, as men can accustom themselves to walk at ease on the housetops. But as most men are apt to get dizzy on a height, so it is a common remark that they are distressed by a first interview with mad people, and begin to feel almost as if their own minds were off their balance. And therefore, although disorder of the brain, being one of the great facts of human life, is not to be excluded from the imaginative world of the poets, we may say with some assurance that none but our greatest can have a right to draw us into the vortex of a lost and tossed intelligence.—*The Times.*

A SCOTCH SCHOOL.—Mr. R. D. Fearon, who, as an assistant commissioner engaged in the recent inquiry into the state of middle-class schools, visited the Scotch burgh (secondary) schools, gives a sketch of a schoolmaster and school as seen by him at work; it may be premised that most of the masters in these schools are graduates of a Scotch university, and the Scotch have a natural aptitude for teaching:—"The school is crowded with sixty or one hundred boys and girls, all nearly of an age, seated in rows at desks or benches, but all placed in the order of merit, with their keen, thoughtful faces turned towards the master, watching his every look and every gesture, in the hope of winning a place in the class, and having good news to bring home to their parents at tea-time. The dux is

seated at the head of the class, wearing perhaps a medal—the object of envy and yet of pride to all of his fellows; fully conscious both of the glory and the insecurity of his position; and taught, by the experience of many falls, the danger of relaxing his efforts for one moment. In front of this eager, animated throng stands the master, gaunt, muscular, and time-worn, poorly clad and plain in manner and speech, but with the dignity of a ruler in his gestures, and the fire of an enthusiast in his eye, never sitting down, but standing always in some commanding position before the class; full of movement, vigour, and energy; so thoroughly versed in his author or his subject that he seldom requires to look at the text-book, which is open in his left hand, while in his right he holds the chalk or the pointer, ever ready to illustrate from map or black board, or perhaps flourishes the ancient 'taws' with which in former days he used to reduce disorderly new-comers to discipline and order. The whole scene is one of vigorous action and masterly force." But outside the schools there is a power at work which supplies them with life and vigour, and this is the extraordinary interest which the parents take in the progress of their boys. "What place in the class to-day?" Mr. Fearon found to be the first question asked when a boy went home; and then would follow questions as to what he had read; whether such a neighbour's son was above or below him, and, if above him, why so; how he had gained, and why he had lost a place; and did he think he had a chance of ever being dux—every word showing the importance which the whole family attach to his success. In short, the schools are practically in the hands of the parents; they pay the full cost of the teaching, and the system in operation gives them the power of controlling the instruction, and a strong sense of responsibility is thus fostered in their minds. The result is that they give their hearts to a task which in many respects none others can do so well. The Commissioners remark that the system is the growth of nearly three centuries, and it would not be possible to transplant it exactly as it stands; but that, to catch something of the same spirit, would undoubtedly be worth much.

POST-OFFICE REVENUE.—The gross revenue in 1839 was £2,390,763. Late in that year the *maximum* inland postage was reduced to 4d., and on the 10th of January, 1840, the uniform charge of 1d. was established. The gross revenue of that year was only £1,359,466; but it has risen from that amount year by year until in 1866 it reached £4,548,129. This does not include the produce of the impressed newspaper stamp, which franks newspapers through the post by a payment made to another revenue department. The net revenue of the Post-office has not been readily ascertainable until recently, owing to the payment out of the gross revenue, in its progress to the Exchequer, of pensions having no relation to the Post-office service. In 1858 the net revenue was £1,389,251, and in 1866 it had gradually risen to £2,127,125. This calculation is made, however, according to the mode in use when the penny postage was established—viz., excluding the cost of the packet service and of stationery.

PHOTOZINOGRAPHY.—The publication in facsimile of "National Records of England and of Scotland," is announced as likely to be completed this year. The facsimile of "Domesday Book," has been the most popular of these republications. The cost of the production was about £3,550, of which above £2000 has been recovered by sales, leaving on hand copies estimated at nearly the same value. The same process is about to be commenced with the "National Records of Ireland."

PAST AND PRESENT IN THE DESERT.—There are the vast Pyramids that have defied time; the river upon which Moses was cradled in infancy; the same sandy deserts through which he led his people; and the watering-places where their flocks were led to drink. The wild and wandering tribes of Arabs who, thousands of years ago, dug out the wells in the wilderness, are represented by their descendants, unchanged, who now draw water from the deep wells of their forefathers with the skins that have never altered their fashion. The Arabs gathering with their goats and sheep around the wells to-day recall the recollection of that distant time when "Jacob went on his journey and came into the land of the people of the East. And he looked, and behold a well in the field; and, lo! there were three flocks of sheep lying by it; for out of that well they watered their flocks; and a great stone was upon the well's mouth. And thither were all the flocks gathered, and they rolled the stone from the well's mouth, and watered the sheep, and put the stone again upon the well's mouth in his place." The picture of that scene would be an illustration of Arab daily life in the Nubian deserts, where the present is the mirror of the past.—*Sir S. Baker.*

IN THE BAY OF FUNCHAL, MADEIRA.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER III.

"HILLO! who have we here?" I heard one of the mates exclaim, as I was taking a last look of our receding antagonist. "Is this a dead man?"

"No, not entirely, as yet," said a voice which proceeded, I found, from a person lying on the deck.

I remembered my prisoner, and ran to lift him up. He recognised my voice. "If it hadn't been for you I should have been dead enough by this time," he said, getting on his feet.

"Who are you?" I asked, "a friend or a foe?"

"A friend; or I wouldn't be here at all," he answered, in a tone which made me feel certain that he spoke the truth.

"Well, come into the cabin, and tell me all about the matter," I said; for though he spoke broad Irish, I saw by his manner that he was above the rank of a common seaman. His appearance when he came into the light justified me in my opinion.

"It's just this; I was first mate of a fine brig, the Kathleen. We had been down in the eastern seas, and away into the Pacific, over to America, trading for

some time with the natives, and bringing hides, seal skins, and sandal-wood to the Chinamen; and at last, having made a very successful voyage, we were on our homeward passage, when yonder piratical craft fell in with us. Each man had been promised a share of the profits, so that we had something to fight for. Fight our poor fellows did, till there was scarcely one of them left unhurt. We none of us thought of striking though; but at last the rascally pirates ran us aboard, and as they swarmed along our decks cut down every man who still stood on his legs. How I escaped without a hurt I don't know. I soon had other troubles; for, being uninjured, I was at once carried aboard our captor, but before the Frenchmen could secure their prize, she blew up, with every soul on board, and there was I left a prisoner alone. I almost envied the fate of our crew. The loss of the prize which had cost them so many lives and so much trouble, made the Frenchmen very savage, especially their captain, who is about as daring a villain as ever ploughed salt water. This determined him, when he fell in with your convoy, to try and cut one of them out. He fixed on you because you were of a size which he thought he could tackle easily, and he hoped to take you by surprise. Why he did not kill me outright I do not know, for he treated me like a brute from the moment he got me in his power; and when we ran you alongside, he made me get into the rigging that I might be shot at; and I thought to myself the safest plan is to jump aboard, and if I escape a knock on the head I may stow myself away before any one sees me. Such is the end of my history at present."

The name of the vessel which had attacked us was the *Mignonne*, privateer, of twenty guns and eighty men, Captain Jules La Roche, of the port of Brest, we learned from the stranger. "And your own name, my friend?" I asked, not feeling very sure that the truth had been told us. "Dennis O'Carroll. My name will tell you where I hail from, and you may look at me as a specimen of one of the most unfortunate men in the world," he answered. If O'Carroll's account of the size of our antagonist was correct, we had good reason to be thankful that we had escaped so easily. Our chief anxiety was now about finding the fleet. We had no business to have separated from them; for though we might easily have run out to the East without encountering an enemy, yet, should any accident have happened to us, our insurers might have considered our charter invalidated, and Garrard, Janrin and Co. would have been the sufferers.

We were much relieved by seeing a blue light suddenly burst forth in the darkness. It came from the deck of the frigate, which had stood after us to ascertain the cause of the firing. Our adventure had the effect of keeping the convoy much closer together; for no one could tell when Captain La Roche might take it into his head to pounce down upon us and pick up a stray bird, should the frigate be at a distance. He would have had no chance, however, with the Indiamen, whose officers were in a very combative mood. Not long before a very gallant action had been performed by a squadron of them in the Eastern seas—indeed, no country ever possessed a body of officers in her mercantile marine equal to those of the Honourable East India Company.

I heard all about the action on board the *Cuffhells*. One morning, when I went on deck, I found that there was what might well be called a calm, the sails of the ships hung up and down the masts without moving, except every now and then, as they slowly rolled from side to side to give a loud thundering clap, and once more to subside into sullen silence. The sea, smooth as a mirror, shone like burnished silver, its surface ever

and anon broken by the fin of some monster of the deep, or by a covey of flying fish, which would dart through the air till, their wings dried by the sun, they fell helpless again into their native element.

Looking round I recognised the *Cuffhells* not far off, and, remembering my promise, asked for a boat to go on board. I was received in the most friendly manner, and was asked to stop to tiffin and to dinner, if I could remain as long.

"Yes, sir, he richly deserved it; every rupee he got—that's my opinion," observed a yellow-faced gentleman in nankeens and white waistcoat, sitting at the other end of the table. "I was on board the *Earl Camden* on my way home, and I know that, including public and private investments, the cargoes of our ships could not have been of less value than eight millions of pounds sterling. We had fifteen Indiamen and a dozen country ships, with a Portuguese craft and a brig, the *Ganges*; Captain Dance, our captain, was commodore. This fleet sailed from Canton on the 31st January, 1804. After sighting Pulo Auro, near the Straits of Malacca, the *Royal George*, one of the Indiamen, made the signal for four strange sail in the south-west. On this the commodore directed four of the Indiamen to go down and examine them. Lieutenant Fowler of the navy, who was a passenger on board the *Earl Camden*, offered to go also in the *Ganges* to inspect the strangers more nearly. It was a time of no small anxiety you may be sure. The *Ganges* was a fast sailer, and before long Lieutenant Fowler came back, with the information that the squadron in sight was French, and consisted of a line of battle ship, three frigates, and a brig. The question was now, should we fight or not. If we attempted to make our escape the enemy would pursue us, and very likely pick us off in detail. Our safest plan was to put a bold face on the matter, and show that we were prepared for fighting. This was our gallant commodore's opinion, and all the other captains agreed with him, especially Captain Timins, of the *Royal George*, who acted as his second in command. The look-out ships were now recalled by signal, and the line of battle formed in close order. As soon as the enemy could fetch in our wake they put about, and we kept on our course under easy sail. At near sunset they were close up with our rear, which it seemed as if they were about to attack. On seeing this Captain Dance prepared with other ships to hasten to the assistance of that part of our line. Just as the day was closing, however, the French, not liking our looks, and unwilling to risk a night engagement, hauled their wind. Lieutenant Fowler was now sent in the *Ganges* to station the country ships on our lee-bow, by which means we were between them and the enemy. He brought back some volunteers, whose assistance was acceptable. We lay to all night—our men at their quarters. At daybreak of the 15th we saw the enemy also lying to, and so, hoisting our colours, we offered them battle if they chose to come down. At nine, finding that they would not accept our challenge, we formed the order of sailing, and steered our course under easy sail. The enemy on this filled their sails and edged down towards us. Now was the time that the mettle of our merchant skippers was to be tried. Did they flinch?—Not a bit of it! The commodore, finding that the enemy proposed to attack and cut off our rear, made the signal for the fleet to tack and bear down on him, and engage in succession—the *Royal George* being the leading ship, the *Ganges* next, and then the *Earl Camden*. This manoeuvre was beautifully performed, and we stood towards the Frenchmen under a press of sail. The enemy then formed in a very close line and

opened fire on the headmost ships, which was not returned till they got much closer. What do you think of it? Two merchantmen and a brig engaging a line of battle ship, two frigates, and two other ships of war—for the rest of the fleet had not yet got up. The Royal George bore the brunt of the action, for Captain Timins took his ship as close to the enemy as they would let him, and the Ganges and Earl Camden opened their fire as soon as their guns could take effect. Before, however, any of the other ships could get into action the Frenchmen hauled their wind and stood away to the eastward, under all the sail they could set. On this, at about 2 p.m., the signal was made for a general chase, and away went the fleet of merchantmen after the men of war. We pursued them for two hours, when the commodore, fearing that we might be led too far from the mouth of the straits, made the signal to tack, and in the evening we anchored ready to pass through the straits in the morning. We afterwards found that the squadron we had engaged was that of Admiral Linois, consisting of the Marengo, 84 guns, the Belle Poule, and Semillante, heavy frigates, a corvette of 28 guns, and a Batavian brig of 18 guns. That the Frenchmen either took some of our big ships for men of war, or fancied that some men of war were near at hand and ready to come to our assistance is very probable, but that does not detract from the gallantry of the action. The Patriotic Fund voted swords and plate to Captain Dance and other officers, and the East India Company presented him with 2,000 guineas and a piece of plate worth 500, and Captain Timins 1,000 guineas and a piece of plate, and all the other captains and officers and men rewards in plate or money, the whole amounting to not less than £50,000. But they deserved it, sir—they deserved it; and I suspect that Admiral Linois and his officers must have pulled out the best part of their hair when they discovered the prize they had lost. Besides the reward I have mentioned, Commodore Dance was very properly knighted."

"In its result the action was most important, but it was scarcely so annoying to the enemy as another in which some Indiamen were engaged in 1800," observed a military officer, laying down his knife and fork, and wiping his moustache. "I was on my passage out on board the Exeter, one of the Indiamen of 1,200 tons, commanded by Captain Meriton. We had in company the Bombay Castle, Coutts, and Neptune, of the same tonnage, besides other ships under the convoy of the Belligeux, of sixty-four guns, Captain Bulteel. A French squadron of three large frigates, it appeared, after committing a good deal of mischief on the Coast of Africa had crossed over to Rio de la Plata to refit, and had just again put to sea, when, early in the morning, they made out a part, and some of the lighter ships, probably, of our convoy. Hoping to pick up some prizes, the Frenchmen stood towards us, and we, quite ready for the encounter, bore down towards them. No sooner, however, did the Frenchmen see our big China ships, with their two tiers of ports and warlike look, than they bore up under a press of sail, and by signal separated. While the Belligeux steered for the largest of the French ships, she signalled to the Indiamen I have mentioned to proceed in chase of the others, we and the Bombay Castle of one of them, the Médée, and the other two of the Franchise. We, at the time, were nearer the Médée than was the Bombay Castle, and we also sailed better. The chase was a long one, but we kept the enemy in sight, and it was near midnight before we came up with her. The Bombay Castle was a long way astern, and the frigate might have handled us very severely, if not

knocked us to pieces before she could have come up to our assistance. Captain Meriton was not a man to be daunted. With the decks lighted and all our ports up, he ran alongside the Frenchman—'Strike, Monsieur, to a superior force, to his Britannic Majesty's ship Thunderaboo,' he shouted out; 'Strike, I say, or—' We did not know whether the Frenchman would reply with a broadside, which would have greatly staggered us. Instead of that the Frenchman politely replied that he yielded to the fortune of war. 'Come aboard immediately,' was the order our bold Captain next gave. Not to be surpassed by the Frenchman, we had a guard ready to assist the captain up our highside. With the profoundest of bows he delivered his sword, and he was then asked into the cabin. Immediately we had him safe, keeping the frigate under our guns, we sent armed boats on board, and brought away part of her people. When the Bombay Castle came up she received the remainder, and we then placed a prize crew on board. Meantime the suspicions of the French captain had been aroused. He had observed the small size of our guns. The appearance of the Indiaman's cuddy and the gentleman and lady passengers—not that there were many of the latter—must have raised curious doubts in his mind. Suddenly he jumped up and asked to what ship he had struck.

"To the Honourable East India Company's ship Exeter," answered Captain Meriton, with a bow which beat the Frenchman's.

"What, to a merchantman?" exclaimed the Frenchman, with a look of dismay.

"Yes, Monsieur, to a merchantman," said Captain Meriton with a gentle smile, which it would have been difficult to repress.

"It is not fair; it is vile; it is a cheat!" exclaimed the Frenchman, beginning to stalk up and down the cabin, to grind his teeth and to pull out his hair. 'I say it is a cheat; give me back my ship, send on board my men, and I will fight you bravely. You will soon see if you take me again.'

"I am ready to acknowledge that you would very likely take me, as I should certainly deserve to be taken for my folly in agreeing to your proposal. You will excuse me if I therefore decline it," was the answer. Though we pitied the feelings of the poor man, it was very difficult to keep our countenance as he uttered his expressions of indignation and anger. He did not recover his spirits till his frigate was out of sight."

This anecdote was followed by several others. Those were pleasant hours I spent on board the old Indiaman. My visits to her were indeed an agreeable change from the sea-life routine of my own ship. I was amused by the progress in intimacy made among themselves by the younger portion of the passengers since I first went on board at Spithead. The captain confided to me the fact that it cost him much more trouble to maintain discipline in the cuddy than among his crew. "What with my young ladies and my chronometers, it is as much as an elderly gentleman can well accomplish to keep all things straight," he observed, glancing at several young couples who were pacing the deck, the gentlemen being cadets or writers. "The friends of those girls now—nice young creatures they are too—have sent them out fully expecting that they would marry nabobs or colonels at least, and in spite of all my precautions, they have gone and engaged themselves to those young fellows who have only just got their feet on the ratlines. Small blame to the gentlemen, however, for a more charming consignment I never had, only the more charming the more difficult to manage."

While the calms lasted, I paid daily visits to my friends, but at length a breeze springing up we proceeded on our voyage, as I must with my narrative, or I may chance not to get to the end of it. We called off the beautiful island of Madeira, with its picturesque town of Funchal—more attractive on the outside than within; we procured, however, a welcome supply of fresh meat, vegetables, and fruits. On our crossing the line, Neptune and his Tritons came on board and played their usual pranks. Jack little thinks that on such occasions he is performing a very ancient ceremony practised by those bold voyagers, the Carthaginians; to them, there is little doubt that the secret of the mariners' compass was known. On sailing between the pillars of Hercules into the wide Atlantic they were visited, not by Hercules himself, but by his representative priests, to whom they were wont to deliver certain votive offerings that the propitiated divinity might protect them on their perilous voyage. The custom of performing ceremonies of a like description was continued to later times by the mariners of the Levant, Greece, and Italy, long after the temple of Hercules was in ruins. When they, and those northern seamen who had learned the scientific parts of navigation from them, extended their voyages across the line, they continued the practices, substituting Neptune for Hercules, and adding a few caricatures to suit their own more barbarous tastes.

Having crossed the line, and there being no longer much risk of our meeting the cruisers of the enemy, Captain Hassall, who had long fumed at being kept back by the slow sailing of our companions, determined to part company. We accordingly hoisted our colours, gave a salute of nine guns in acknowledgment of the civilities we had received, and under all sail soon ran the dignified moving convoy out of sight. Light and contrary winds and calms kept us so long under the sun of the tropics that the seams of our decks began to open, and to get them caulked and other repairs executed, we bore up for St. Salvador on the coast of Brazil, belonging to Portugal. We saluted the fort on entering, and paid every necessary respect to the authorities, but we soon found that they either suspected our character, or were not inclined for some other reason to treat us in a friendly spirit. A guard was put on board, and we were told that neither officers nor crew must leave the ship.

We were still ignorant of the cause of this treatment, when the master of an English whaler came along-side with his men armed to the teeth. He told us that he had a letter of marque, and that on the strength of it, having fallen in with a Spanish merchantman some way to the south-west, he had chased and captured her, and found a large number of dollars on board. Having come into St. Salvador he found there no less than seven other Spanish vessels, the masters and crews of which were favoured by the Portuguese, and he heard that they threatened to follow him out and capture him and his prize. Our arrival had turned the scales in his favour, and he offered to remain if we would accompany him out when we were ready. This Captain Hassall readily promised to do. As the whaler was strongly manned, a good sized crew had been put on board the prize, and thus our three vessels were somewhat of a match for the Spaniards we hoped. At length the Governor of the place ordered the officers of the ship to appear before him. Accordingly Captain Hassall, the first mate, and I, accompanied by Dennis O'Carroll, who seemed to be able to speak every language under the sun except pure English, as interpreter, went on shore under an escort. The Governor, a fat, swarthy personage in the full dress uniform of a general,

received us in a haughty manner, and cross-questioned us in the most minute and tedious manner. Dennis somewhat puzzled him by the style of his answers, which were anything but literal translations of what Captain Hassall said. The result, however, was favourable, and we were allowed to go wherever we chose about the city, and to get the necessary repairs of our ship executed, and to obtain all the stores and provisions we required.

Much relieved, we made our bows, and then took a turn through the place before going on board. I was much struck with the number of churches, of priests, and monks, and black slaves, the latter habited in the most scanty garments, and the former perambulating the streets in parties dressed up in the richest attire of coloured silks and gold, with banners and crosses, and statues of saints, or representations of events mentioned in the Scriptures, the figures as large as life. A large number of friars in black, or brown, or grey gowns of coarse cloth, with ropes round their waists, were going about two and two, with small figures of saints on money boxes. The figures they literally thrust into the faces of the passers by to be kissed. We saw no one refuse to drop a coin into the box.

"These must be a very religiously disposed people," I observed to Dennis.

"If you knew what I do you wouldn't say that," he answered. "They're fond of sinning and they are ready to pay for it. The reason that all these priests and monks flourish is this—they have succeeded in teaching the people that they can buy pardon for all the sins they commit. The only scrap of real religion the poor people are allowed to possess is the knowledge that sin must be punished if not forgiven. Instead, however, of showing them how forgiveness can alone be obtained, they make them believe that money can buy it through the prayers of the saints; but when they've got the money in their own pockets, it's very little trouble they give the saints about the matter at all."

"How did you learn all this, Mr. O'Carroll?" I asked.

"Just because I believed it all myself," he answered quickly. "I'll tell you some day how I came to find out that I had been sailing on a wrong tack; but you think me now a harum-scarum Irishman, and I'm afraid to talk about the matter."

On our way we passed through the dockyard, where a fifty-gun ship was building, and several smaller vessels of war. We were looking at one repairing alongside the quay, when I saw O'Carroll start, and look eagerly at the people on board.

"That's her, I am certain of it," he exclaimed. "She has got into trouble since she parted from you, or you may have done her more harm than you thought for, and she has put in here with false papers and under false colours to repair damages."

"What vessel do you mean?" I asked.

"Why, the Mignonne to be sure, or by what other name she may go," he answered. "Probably she is now the San Domingo, or some other saint under Spanish colours, and hailing from some port on the other side of the Horn. Our friend, Captain Brown, of the whaler, had better make haste, or she will be after him and his prize."

"Why not after us then?" I asked.

"Because Captain La Roche has had enough of your quality, I suspect," he replied. "He is a fellow who only fights when he is sure of booty, and though I dare say that he would like to send you to the bottom, he would not go out of his way either for revenge or glory."

To satisfy ourselves we examined the stranger as narrowly as we could, and O'Carroll was thoroughly convinced that he was right in his suspicions. While thus employed a man appeared at the companion watch.

"Why there is La Roche himself," he cried out. Scarcely had he spoken than a bullet whizzed by his head. "That settles the matter," he said, quite coolly. "Let us be out of this or he will be following up this compliment." We hurried out of the dockyard. I proposed making a complaint to the authorities.

"And be detained here several weeks and gain nothing in the end," he answered, shaking his head. "My advice is, get ready for sea as fast as you can, and if you wish to serve Captain Brown see him safe out of sight of land before the Mignonne can follow. We'll keep a watch on him in the meantime, or he'll play us some trick or other. Above all things don't be on shore after dark. La Roche has plenty of friends here, depend on that, and he will find means to pick us off if he thinks that we are likely to inconvenience him."

Following O'Carroll's suggestions I immediately returned on board. Captain Hassall at first scarcely credited the account we gave him—indeed, he did not, I saw, put thorough confidence in O'Carroll. However, he agreed that we ought to warn Captain Brown, and that it would be well for us also to sail before the supposed privateer was ready for sea.

UNSKILLED TRAMPS.

In a previous paper, we gave some account of the trade tramp, the skilled artisan who wanders from place to place, working or not working, as inclination prompts or opportunity may avail him. We shall now turn our attention for a few moments to his congener, the unskilled tramp, who has followed no particular calling since he was his own master—whenever that may have been—and has no intention of following any. The first fact that strikes us in connection with this subject is the enormous number of supernumeraries which at all times and seasons abound in our towns and country-places, and are ever turning up whether they are wanted or no. There may be, and there often is, a dearth of labourers to gather in the fruits of the earth; there may be a want of workmen and artificers in this craft or the other; there may be an outcry for seamen to man the fleet or supply the demands of the merchant service; and the recruiting-sergeant may be driven to his wits' end to procure the "fine young men" wanted to fill up the gaps in the ranks of Her Majesty's regiments of the line—but of vagabond non-workers and non-fighters there is never any lack; they are found everywhere and at all times, and they constitute, it may be affirmed, the most permanent and the most ubiquitous of all our social institutions.

Are they the victims of a malady, or are they the subjects of an irresistible fascination?—these English lazzaroni. Is laziness a disease, and is it hereditarily entailed, or is it a life-engrossing luxury, indulged in at the cost of well-nigh everything else which people who work consider worth having? We are inclined to think, as the phrase goes, that it is six of one and half-a-dozen of the other. At any rate, evil habits are a disease, and the luxury of laziness, if it be long indulged in, will infect a man like a leprosy, and number him with the morally incurable. How it comes to pass that, not working save under compulsion, the unskilled tramp contrives to live, is a question not to be answered in a breath. In fact, to answer it at all, one had need know

more of these gentry than anybody does know, or is likely to know until some candid member of the class shall condescend to enlighten us with an autobiography. Of course, if the tramp were a thief, the mystery would be cleared up; but, as a rule, he is not a thief. Apart from the operation of honesty of principle, it would not suit him to render himself obnoxious to the law; his safety lies in keeping clear of crime and the suspicion of crime, so that he may be free to come and go in all places unchallenged. It is not the regular tramp who steals even food to satisfy his hunger, or strips linen from a hedge to cover his nakedness; or who poaches the squire's preserves, wires his hares, or tickles his trout; such practitioners are exceptional rogues, who tramp the country on foraging expeditions, and who may be said to have a calling, though their industry is a loss, and not a gain, to the community.

In old times the laws against tramps were much more severe than they are now. The legislature gave them an ill name, defining them as "sturdy rogues," and punished them accordingly. To "comprehend all vagrom men" was the duty of the Dogberrys of Shakspeare's time, and to allow them to rot in prison after they were taken, appears to have been part of the system of punishment. Our more complex civilization, and the needs of our teeming population, have practically done away with that, and without repealing the old laws, have suffered them to fall into abeyance. We are too densely peopled to recur to that plan: our poor often starve in the streets as it is; without perfect freedom of transit from place to place, and liberty to seek relief where it may be found, we should see them in seasons of severity perishing by hundreds. The "sturdy rogue" of our day is allowed his personal liberty unchallenged so long as he respects the law, and he lives and moves under a system of surveillance of which his ragged predecessor had not the slightest notion. We meet with him sometimes in our walks, and recognise him as the lineal descendant of his venerable ancestor; it is he who, in the tender gloaming of summer, haunts the shady solitudes where sentimental young ladies repair to indulge their poetic imaginations. There, armed with a bludgeon, whose but-end, in a high condition of phrenological development, protrudes suggestively from under his arm, he takes his stand in some shady niche, and presents himself suddenly to the bodily eye of the musing solitary—a very ugly hamadryad indeed—and informs her, in a voice compared to which that of Dirk Hatteraick were melody itself, that he wants a shilling, and that if he doesn't get it he shall be obliged to do something dreadful. Of course he gets it—no imaginative fair one, all alone in a green lane, can resist that touching appeal—and having got it, he considerably relieves her of his company. Or he dogs some nervous elderly gentleman in his lonely walk, and selecting his point of vantage, pours into his unwilling ear a tale of woe, culminating in a reckless, despairing kind of demand for relief, delivered in a manner which is a veritable "shock to the system" of the luckless auditor, who is but too glad to escape from it at the cost of two-and-six. Or, in default of out-door subjects to deal with, he calls at some lone house, whose master he has watched out of hearing, and asks for a "drink o' water," under cover of which modest request, he will manage to levy rather heavy blackmail, should it happen that he has only women to deal with.

One is pleased to turn away from the contemplation of such a rascal as this, and to bestow a moment's attention upon the educated tramp, who is by no means so scarce a specimen as many simple people, who deem edu-

cation a sovereign cure for all moral evils, are apt to imagine. Some writers suppose that the nomadic instinct runs in the blood, and cannot be eradicated. However this may be, it is certain that the inclination to vagabondism breaks out in very various classes, and that instances are not wanting where the soundest education fails to repress it. We adverted to this subject in a preceding paper treating of the trade tramp; but, as a rule, the trade tramp is never more than very partially educated, whereas the unskilled tramp is not unfrequently somewhat of a finished scholar, capable of taking a good position, had he only the will and the necessary impulses. We have known a first-rate mathematician, to whom the differential calculus was as familiar as were his own empty pockets, to go out on the tramp, and to prowling the country for years, until his shirt literally dropped away in tatters. We knew another who was versed in all the philosophical systems from Aristotle to Kant, inclusive, and who would discourse metaphysics with untiring volubility, and that to the admiration of men well versed in the subject. A clergyman, who has written concerning tramps lately in a popular journal, tells us of one who rendered into classical English a tough passage from Cicero at sight. Some years ago we happened to be reading at an open cottage-window in the country, when a tattered figure stepped up and volunteered a lesson in Greek in return for a meal, of which he seemed sadly in want; to test him we put a copy of the *Odyssey* into his hand, when he rapped out a dozen verses, describing the escape of Ulysses from Polyphemus, giving them *ore rotundo*, and adding without a moment's hesitation, a characteristic translation. At another time, at the same place, a man who begged the job of weeding the garden for sixpence, read off readily into English any part of the Hebrew scriptures. It is not always that the educated tramps are in the garb of squalid poverty; they often retain some regard for appearances, not to say personal comfort; sometimes they will introduce themselves courteously in your walks, perhaps with some encomium on the scenery, flavoured with an apt quotation from a classic author, and will ingeniously establish a conversation, and as certainly in the course of it make themselves the topic, winding up with a confession of impecuniosity, and their willingness to accept a temporary loan from "a gentleman and a scholar" like yourself. In a rencontre of this kind we know from experience how extremely difficult it is to come off quite scatheless.

The mass of our tramping vagabonds, however, are, it must be confessed, of a very ordinary mental calibre. Perhaps the majority of them may be set down as being originally rustics born to labour, which, not suiting their inclinations, they have managed to shift off upon others. There are thousands of them who, though they hate regular labour, and loathe the idea of servitude in any shape, will yet work like horses at certain times and by fits and starts. Thus, at the haymaking and harvest seasons, when a double or treble wage is to be won by herculean exertion, these are the men to make it; but even on such seasons not much reliance can be placed on them, as they soon grow weary of routine, however profitable, and must have novelty and change of scene.

In hunting counties, especially during the hunting season, a characteristic class of hangers-on are always to be found—fellows wanting neither in humour nor endurance, nor in physical energies; they have certain other qualities, not easily defined, which recommend them to sporting gentlemen: they will run with the hounds for half a day together, making up by their

knowledge of the country, and of the instincts of the fox, for the lack of a steed, and will sometimes come in at the death while half the field is far in the rear. Such a fellow is in luck when a rider comes to grief within hail of him—he runs to the rescue instinctively, picks up the fallen hero, catches his steed and remounts him, or, if the case is too bad for that, deposits the patient in an easy position, mounts himself, and gallops off for assistance—for all which timely aid he is sure to be liberally rewarded. It would almost seem that some of this class make it their business to hover about wherever there is the chance of accident or peril of any kind, since in case of any disaster, whether serious or slight, occur where it will, one or more of them is sure to start up and proffer service. Apropos to this view of the matter,—there was a story current some years back of a speculative fellow who devoted himself to the idea of laying the old Duke of Wellington under an obligation that should make him (the speculator) a rich man. His idea was, that the Duke would be some day thrown from his horse—that he would pick him up—and that the act would make his fortune. It was said that he followed the Duke everywhere with this view, dogging him in all his rides, ever ready and eager to run to his assistance when the wished-for misfortune should arrive. On a certain day, runs the story, when the Duke was crossing the parade-ground at the Horse Guards, he actually was thrown from his horse, through pulling up suddenly to avoid a child. The old soldier, however, was too quick in his movements to require help from any one, and was in the saddle again before the ever-watchful follower could get up to him. The chagrin of the would-be preserver at the Duke's ungenerous haste, it was added, caused him so much disgust that he gave up his idea and left the old hero to his fate.

Benevolent persons, exposed to the frequent appeals of tramps, have in many instances adopted the plan of subjecting them to the labour test before affording them relief. The tramp rarely objects to this, in moderation, because his antipathy is not so much against working "a spell" now and then, as against the slavery of constant employment. Some persons keep a piece of ground to be turned up by the spade, awarding a shilling to the worker when the whole is done; and so long as this is supposed to be real work, the tramps are for the most part content to do the whole more or less carefully for the shilling; but let one of them know that the digging is merely a test, and has nothing to do with cultivation, and he will scorn to touch it. A man offered work of this kind feels himself insulted. He will tell you, if you reason with him, that though you may choose to call him a pauper, you have no right to treat him as you would a criminal—and that it is only criminals who are put to unproductive labour. From which it would appear that even tramps cherish their own idea of self-respect.

TWO MONTHS IN SPAIN.

VIII.—ALICANTE AND VALENCIA.

FROM Malaga to Barcelona there are three good boats, built on the Clyde for Messrs. Lopez & Co., of Cadiz, called the Alicante, Madrid, and Valencia. One of the gentlemen who accompanied me to Granada embarked with me in the first-named. These vessels sail from Cadiz, calling at Algeciras, Malaga, Alicante, Valencia, Barcelona, and sometimes go on to Marseilles, but when I was in Spain, the Government had put Marseilles in quarantine, and the boats went no farther than Barce-

lona. We left Malaga at noon, and got into Alicante at 10 A.M. the following morning. The reader will find in many English books the name of this place spelt without the final e, and constantly pronounced so, but this is an error. In Spanish, as in Italian and Latin, the final e is accented, and it should be written and pronounced Alicanté. The view of the town is singular and picturesque. It lies amidst rugged barren-looking hills. The old Castle stands prominently out, on a precipitous hill 400 feet above the bay. This once celebrated stronghold of defence against the Moors is now in a ruinous and neglected state. I found it a hard pull to mount these jagged and rugged limestone cliffs, and to get to their top under a hot sun; but the magnificent view obtained of the surrounding scenery from this elevation is worth any amount of labour. There is a good trade done in the place, and it contains some comparatively wealthy British and Spanish merchants. I was agreeably surprised to find so many attractions in a small seaport town. In the old part of the town the streets are narrow, and the buildings of the usual Moorish look; but in the new, or *renewed* parts, round the harbour, the houses are four to five stories, built of stone, or white-washed plaster, and the streets broad, clean, and well-paved. There is a large and rather elegant theatre, a fine town-hall, and a good club or casino, with the usual alameda and public walks. Finding that the vessel was to lie here till the following evening, my *compagnon de voyage* got disgusted at the idea of remaining for thirty-two hours at this small seaport, took his traps on shore, and started by rail for Valencia, forfeiting his passage-money to Barcelona. I was annoyed myself at the delay, but being known to the kind and hospitable British Consul I was invited to his house, and had the advantage of seeing and learning all about the place, and spending a very agreeable day.

We drove a short distance into the country, and witnessed the extraordinary fertility of the Heurta. This is a term used in the South of Spain to denote a small, fertile, watered district, and may be literally translated a garden (*hortus*), and such it was in the days of the industrious Arabs. Their system of irrigation is still carried on to a small extent, and where this is attended to the land will produce two or three crops a year. The vine and olive in particular grow in profusion. The vintage of last autumn seemed to have been very abundant, if not profitable. A gentleman who has a plantation of nearly a million vines told me that he had sold the whole of his wine this year at a fraction over one halfpenny a bottle! This seems scarcely credible, but you may depend on the fact, as we went into the calculations. The vine bears a little the second and third years, and is of full value the fourth or fifth year, and lives to about the age of man, "three score years." The carob tree, so well-known in Malta and the Levant, where its produce forms an article of commercial importance, grows here in abundance. It has a dark green foliage, not unlike the oriental plane tree, and produces a pod, smaller than that of the tamarind, but like it containing a pulp of saccharine matter which covers the seed. There are some curious traditions about this production. One is that it formed the food of John the Baptist, and it is still called St. John's bread; another that it constituted "the husks on which the prodigal son fed:" both of which are very doubtful. In Spain it is chiefly used as food for cattle, and sometimes eaten by the poor, but it is neither safe nor wholesome for human food. The Government has another of those great tobacco manufactories here, where some thousands of women are employed. We met a number of these poor

creatures going home to their villages; many of them live three or four miles off, and walk this distance to and from their work. They receive two reals, *i.e.* five-pence, per day, and have a life of great poverty and hardship. Some of the old fortifications are being cleared away for new streets and walks. The small harbour is protected by a mole, with a narrow entrance, in which a good number of vessels were anchored, and among them a smart little craft which had just been brought in as a smuggler, and seemed likely to give as much trouble as the Queen Victoria. This vessel cleared out from Gibraltar, with "a general cargo" of tobacco and cotton piece goods, for Genoa. The Spanish spies give notice of the clearing out of these vessels, when they are suspected, and they are followed by the revenue cutters. The captors said that the vessel was within $1\frac{1}{2}$ miles of the shore, and making signals. The captain and crew swore that they were six miles off land on their legitimate voyage, and all their papers correct; in short, there was "hard swearing" on both sides; and the seizure appeared likely to give our Government and consuls a great deal of trouble. It is rather unfortunate that these vessels sail under the British flag, while there is not a single Englishman on board. The crews are composed of Portuguese, Spaniards, and half-caste Gibraltar men, not one of whom can speak a word of English; and as the circumstances were rather suspicious, the cargo being altogether unsuited for the Genoa market, it is very hard that England should bear the odium attached to this contraband trade. This is another of the bad results of a blind monopoly; the heavy duties on foreign produce offer a premium and encouragement to smuggling.

The climate of Alicante is delightful, and the temperature like our finest summer day. It is a question with physicians whether it is not more favourable for invalids than Nice, or any of the Italian ports. The thermometer seldom rises above 85 degs. in summer, or falls below 65 degs. in winter—in fact, there is no winter, but one perpetual spring. A few years ago the inhabitants numbered 16,000; but after the opening of the railway direct from Madrid, and the consequent increase of trade, they now number 31,000. Notwithstanding the delightful climate, I question if the attempted cure of invalids would not be worse than the disease, and if they could survive the *ennui*, if they did not die of consumption or bronchitis; there is lack of proper medical advice, and of the most ordinary comforts of civilised life. The Anglo-Spaniards seem to have a great dread of falling into the hands of Spanish physicians, and I think, with some show of reason; for I heard from those who were entitled to give an opinion on the subject, that the medical profession in Spain is of a very low standard, chiefly of the barber-surgeon kind. It might be well for the people if they could spare a little of the wealth of their cathedrals to endow good medical schools, and introduce foreign professors of acknowledged talent. A priest of very small capacity may administer "Extreme Unction," but it is only long and severe study, superior intellect, and research that qualify men for the ennobling profession of medicine, of which the Spaniards have scarcely any conception.

We left the harbour at 6 P.M., with a calm sea, a clear, bright, starry sky—so mild and pleasant that one felt inclined to walk the decks all night. The whole coast from Malaga to Valencia is a succession of bays and headlands, each crowned with a pharos to guide the mariner along the broken and dangerous coast into their small havens. The passage occupied twelve hours, and we anchored off Valencia at 6 A.M. I should say,

a long way off; for, strange to say, neither map, guide-book, or previous conversation, had advised me that the town proper was nearly two miles off, to the great loss of time and inconvenience of trade and shipping. The "Grao," a Valencian term for the ports round the coast,

imagined. You may count sixteen to twenty little towns and villages, with their domes and campaniles. The whole plain, for twenty miles, is studded with cottages and mansions, and is in apparently good cultivation. The inhabitants of the cottages are exten-

ALICANTE.

I took to be the town, and thought I had nothing to do but step on shore and go to an hotel, or present my introductions, but the host of sharks that infest this harbour soon convinced me to the contrary. After a little explanation, I hired a tartana, a conveyance peculiar to Valencia, and not unlike the after part of a gondola placed on wheels, or a common cart covered with a black awning. They have a railway from the harbour to the town, which I might have availed myself of, but I preferred the long rough ride through a fine avenue of trees. Several handsome bridges span the broad dry channel of the river, the water of which is diverted from its course for the purpose of irrigation. When I found that the vessel was to remain only a few hours, I hurried to deliver my introduction, and take a drive round the town, and return to the vessel at noon; but the same hospitality awaited me as at Alicante, and my young friend would not hear of my leaving so abruptly; so, to gratify my own wishes and carry out those of my kind host, I forfeited my passage to Barcelona, and remained for two days.

It would have been a great mistake to have lost the many sights and attractions in and around this old city. The first thing to be done was to get an idea of the topography of the place, and a bird's-eye view of the surrounding country and scenery, for which purpose we ascended the bell tower of the cathedral. This is a sight of which the Valencians are, and have a good right to be, proud, for no finer view can well be

sively employed in the silk trade, and between the rich gardens and ploughed fields there is a complete forest of mulberry trees. The Moors made this fertile valley a perfect paradise of beauty and production, and their system of irrigation is still carried out on a small scale. Still, the land produces two, and sometimes three, crops a year. All the persecutions, inquisitions, and bad government of church and state, have not been able entirely to obliterate the skill and industry of earlier days.

I cannot help thinking that it must be at times rather mortifying and humiliating to an educated and intelligent Spaniard, notwithstanding the exciting and romantic history of his race, to find that everything which gives their country a claim to civilisation, they derive from the much despised Infidels! In theory it may be right to prefer even a corrupt form of Christianity to the Mohammedan creed, but one is almost tempted to ask what Spain has gained by her grand cathedrals and temples filled with idols loaded with jewels, and daubed with paint and tinsel? There was a time when the Reformation had made marked progress in Spain, and with it would have come lasting freedom and energy to the people. But true religion and free thought being suppressed by the Inquisition, the country has paid the penalty in all the evils that follow civil and ecclesiastical despotism.

But to return to the system of irrigation: the canals or small water-courses intersect the fields and gardens,

on which the Egyptian water-wheel is employed much after the manner of the agriculturists on the banks of the Nile, and produce abundant crops. The rice grounds, from their swampy nature, give rise to a good deal of fever at certain seasons. I was shown some fine speci-

them would have graced the Bois de Boulogne or our own Rotten Row. The occupants were of the usual Spanish type of beauty, round faces, fine eyes, and a profusion of dark hair uncontaminated with cheese plate or saucer bonnets, but with a silk or lace scarf

THE PORT OF BARCELONA.

mens of the South Australian "gum tree"—I forget its colonial name—and was told that the leaf possessed some of the qualities of quinine, and was being rapidly propagated, in the hope that it might ameliorate the injurious effects of the malaria. The peasantry have a strong dash of the Arab about them, both in looks and costume, and I think still retain some of their industry.

The town of Valencia forms nearly a circle, and lies in this rich and beautiful valley like a round pearl in a variegated shell. The population of the city proper is about 80,000, but if we include the environs, within a circle of five miles, there may be 150,000. One-third of this circle is skirted by the broad, dry bed of the river Turia, which is crossed by four or five handsome bridges. There are few of the old Moorish houses now left, but the narrow streets, tall houses, with bowed windows, green blinds, and projecting balconies, still retain their oriental character. The town was formerly surrounded with a heavy wall, towers, and lofty gates; some of the latter are still retained, but the authorities have had the good sense and taste to pull down these old walls, and replace them with modern buildings and broad walks. Their Alameda is one of the finest in Spain. My friend was kind enough to give me a drive in the afternoon, to see the beauty and fashion of Valencia. The equipages were numerous, and many of

hanging from the back of the head and falling gracefully over the shoulders. This fine broad drive is divided into four avenues or *paseos*, skirted with myrtle, cypress, and orange trees, and ornamented with roses and beds of flowers, with some four or five fountains, of marble and jasper, sparkling with jets of water in every form of beauty; add to which, a bright blue sky, and soft, balmy air, and one might almost forget this busy, toiling, responsible life, and fancy oneself in a sort of Mohammedan paradise. The "sights" of the town, that may be seen in two days, are of course the cathedral and churches, which vie with other cities in Spain, in art and ornament. They have the usual Plaza del Mercado. I have elsewhere referred to the splendid markets of Spain, and their large supplies of fruits and vegetables, the finest I ever saw. My friend explained, "that the people live from hand to mouth, and purchase every morning what is required for the day, of meat and vegetables; that they have no greengrocers' or butchers' shops as in England, and consequently require these fine markets." The Plaza de Toros, or bull ring, in Valencia is the finest in Spain, after the model of the Roman Coliseum, and accommodates 16,000 spectators. The season for these brutal exhibitions is from April to November, so that I was deprived of one of the greatest sights of Valencia! Though the streets are narrow and tortuous, there are

many splendid mansions in the Moorish-Spanish style, with open patio, fountains, and flowers, broad staircases, and marble banisters. Here also the Government has a great tobacco manufactory, where many thousands are employed on a bare subsistence.

From Valencia to Barcelona there is a break in the journey where the railway is not completed. We left the former city at five p.m., and about midnight got into a diligence for two hours, and again joined the line. At sunrise we reached Tarragona. Here we left the province of Valencia and entered that of Catalonia, and were detained two hours. This gave us an opportunity of ascending the ramparts, from which we had a fine view of this ancient and most interesting city. You will know that this was the Roman capital of Spain, said then to number nearly a million inhabitants. It has a long and painful history, both ancient and modern. It was here that Sir John Murray made some sad blunders, and nearly defeated the plans of the Duke of Wellington (see Napier). The city now contains only about 12,000 inhabitants, and is still strongly guarded with ramparts and outworks, and many of the débris of the Roman city are to be seen in modern buildings. The view from these ramparts, over sea and land, on a bright morning is beautiful and picturesque.

At nine a.m. we proceeded on our journey by rail, and arrived at Barcelona at eleven a.m., on one of the brightest and most beautiful mornings that I enjoyed even in Spain. I had the good fortune to arrive in time to see the great fair that is held in Barcelona on the two or three days preceding Christmas. The country people in their best and picturesque costumes had come into town in thousands; and on the Sabbath-day the streets and broad avenues were crowded with men, women, and children, buying toys or gambling for their Christmas dinner. The stalls and gambling booths lined the sides of the streets, and all classes were trying their luck, from the poor old beggar woman to the well-to-do housewife, eager to get a prize of anything, from a brace of small snipes to a well-fed goose or turkey. I never witnessed such a scene of bustle and excitement, a sort of old Glasgow fair without its rougher elements. This city ought to have been the capital of Spain. It is beautifully situated on the Mediterranean, with a good harbour, and the finest and most genial climate in the world, and in a rich and fertile valley, surrounded with a range of hills, studded with villas, and clothed with evergreen vegetation. It is contiguous to Marseilles, and open to the trade of all the world. The inhabitants are more active and industrious, and I may say more independent, than the Castilians, and the climate the most healthy in Spain; and if historical prestige goes for anything, it was here that Columbus presented Ferdinand and Isabella with a new world.

MOTHER'S WORK;

OR, THE EDUCATION OF THE HEART.

CHAPTER II.—LOVE AND HATE.

THE heart of a child begins early to love and hate. There is nothing which it does more heartily. Upon what it loves and what it hates will depend the bias of its character, the tendency of its future life. At first a child will be strictly personal in these emotions. It will love or hate people, and perhaps things. The next attainment, and a very important one, is to love what is good, and to hate what is bad. But how to get hold

of the abstract idea of goodness, and badness, and so to apply the emotion of the child to that, without personality, is indeed a difficult matter; for there is something so real, so solid, if one may use the expression, in the love of a child, and also in its hate, that it seems almost impossible to attach either to an idea without a substance.

This necessary lesson of loving only what is lovely in itself, as goodness is, can scarcely be taught to a child in connection strictly speaking with its parents, because everything in them is good and lovely to the child; and the same difficulty would apply to the case of other near relatives, or indeed, to all who were connected with it by the ties of affection. Love is so natural to the child, so born with it, that it begins to love before it is possible for it to understand why, and indeed, before there is any reason why, except that certain individuals minister to its wants, gratify its desires, soothe its sorrows, and, in short, sustain its life.

Nor would it be easy to find more substantial reasons why any one should be loved than these. Only that a little later, and when reason might be supposed to exercise more power, they do not always hold good; for human life as it is presents this strange anomaly, that persons are not always loved according to the benefits they confer. Hence we discover that this fountain of love which springs so freely from the heart of the child, is in reality a very capricious, uncertain, and unmanageable stream, flowing this way, and that—sometimes overflowing in quarters where the utmost pains are taken to dam it up, and stem its current; and sometimes falling off, and even drying up, where its genial waters are most required. Every one who speaks or writes on this subject, poets, philosophers, the wisest and the best of men and women, appear to have agreed in the opinion, that love is an impulse of our nature, which must take its own course.

Leaving this knotty point to be discussed by those who understand better than myself, I return to the love of a little child, which it is of the utmost importance that the mother should at least endeavour to direct to that which is worthy of being loved. To love mean things and base people is certain degradation to the child. To love what is intrinsically lovely is a certain means of elevation.

To love goodness simply because it is good, and to love it under every form in which it can be recognised, is one of the highest and noblest attainments of our moral nature, so high, indeed, that nothing less than that regeneration of the heart which is effected by conversion to the love and the service of Christ can lift us up to this height of being. But the mother, especially the Christian mother, can begin, God helping her, with this holy and delightful task. Only she must be content to begin simply, humbly, and without embarrassing the tender conceptions of the child with images and phrases which it is impossible for it to comprehend. She must be content also to work with human means; and this is too often what Christian parents will not do. They seem impatient of such means; and want to begin at once with spiritual instrumentality long before the child is capable of lifting its thoughts and conceptions to such a height as to go along with this kind of instruction. It is upon the mother herself that the spiritual influences must operate so as to fit her for this work; nor is it necessary to be above using the most humble and familiar means, because she may still use them with a spiritual purpose.

In teaching children to love goodness, we must love it ourselves, look out for it, embrace it, delight in it

wherever it may be found. We must rejoice in it when found in an inferior—in an enemy—and what is much more difficult, even in one who has stepped into a place of usefulness which we tried to fill, and failed in. If we do this ourselves, habitually and heartily, the children under our care will require but few lessons beyond this—our daily example.

But supposing this lesson of example to be a little defective, I think the mother may help out her purpose by placing before the notice of her child, in an interesting and attractive manner, instances of goodness occurring amongst indifferent people, or people not otherwise beloved personally. A poor beggar man may have picked up a shilling which he saw dropped by a passer by, and restored it to the owner when he sadly wanted a shilling himself. Or a hungry child may have carried a dinner to her sick father without tasting it herself. A boy may have rescued from its tormentors some poor animal, or another may have helped an old paralytic woman to carry her bundle of sticks. Instances of this kind are daily occurring in ordinary life, and when the mother is looking out for them, and listening to hear about them, surely her own heart will be refreshed and improved, for I am strongly inclined to think that the reason why we hear so little good of our neighbours is that we do not watch and listen for the good as we do for the evil. Among those whom we love no doubt we do, but true charity comprehends a wider range, hoping all things, believing all things.

All who have the training of children, and who have obtained a hold upon their affections, should remember that they exercise over them an almost unbounded power in the use of praise and blame. A child, and especially a girl, can be worked upon to love almost anything by hearing it praised by one she loves; and she will hate as readily and in the same proportion.

It is a curious fact, and very difficult to account for, that in the ordinary range of social intercourse, blame is much more frequent than praise. For once that we hear a good deed heartily commended we hear at least fifty bad deeds condemned, or else we hear the good so questioned that all the virtue seems extracted out of them. Even Christian people of devoted lives appear to be strangely on their guard lest they should praise too much. But they can blame, and by doing this so much more often, or perhaps more earnestly than they praise, the balance is lost, and the scale goes down laden with its heavy burden of human infirmity and sin; and we look on with mournful eyes, exclaiming, "Who will show us any good?"

One of the greatest hindrances to what I have ventured to call the education of the heart, and a cause of much and grievous loss to the young, arises, I think, from the restraint which religious people sometimes impose upon themselves and others, in not calling anything good which does not directly promote the salvation of the soul; so that we are in a manner deprived of the use of these two words, good and bad, than which there can be none more powerful in the work of education. Nor is this mode of regarding the matter consistent with our daily conduct. The most rigid in enforcing these restrictions will speak of good and bad in relation to their servants, and all persons employed in their business matters; and they use these terms continually in relation to the honesty, truthfulness, punctuality, and industry of such persons. They speak of them as good servants, good clerks, or good agents, when they possess these qualities, and they speak of them as bad, when these qualities are wanting, or when the opposite of these qualities are manifested.

Good and bad are words which we cannot do without when speaking of the general conduct of mankind. They apply to citizenship, to social and relative duty, honesty or dishonesty in business transactions, in fact to all which materially affects the interests of this present life, which promotes prosperity, or leads to ruin, which makes a country, a family, or an individual respectable or otherwise. To have just and clear views on matters of social and relative duty, mutual obligation, friendliness, trustworthiness, personal responsibility, industry, and all that we generally class under the name of morals, is no trifling attainment. It is, at least, as important as to have just and clear views on geography, grammar, or any other branch of that kind of learning which is taught so carefully, and with such indefatigable pains in the usual routine of school teaching. We may, therefore, fairly ask that the same amount of pains, the same amount of time, of study, and solicitude should be bestowed upon the former as the latter portion of education.

Nor need the Christian fear that in using every possible endeavour to awaken in the child a love for what is good—simply good as opposed to bad—there will be danger to that child in its subsequent religious impressions. If the principles of good and evil, by which the moral conduct of the man or woman has to be regulated, were at all, even in the slightest particle or degree, opposed to God's own law of right and wrong, then unquestionably there would be danger. But I am not speaking of expediency, of what is sanctioned by custom, or of what may tend to serve some sordid purpose. I am speaking as good of that which is essentially and eternally good, of that which was good when written in tables of stone, and which Moses brought down from the mount of ineffable communion; the same immutable good which was taught by the Saviour himself, and which pervades the whole record of his life, as well as the doctrines of his disciples.

There is no change, there can be none, in good and evil when regarded in this light, because both are founded on principle, the one sustaining, health-giving, uniting, and elevating, the other tending always to discord, misery, and destruction. The germs of both these principles lie in the heart of the little child; and happy and holy is the task of the Christian mother so to cultivate the one that by God's help it shall increase and strengthen and outgrow the other, as the flowers of a well-tended garden outgrow the weeds.

These remarks have been made at greater length, because, in dealing with the love of her child, the mother has to discharge the tenderest and most delicate of all those tasks which are committed especially to her care. Yet delicate and tender as are the little threads of feeling which she holds, it may be prayerfully, in her nurturing hands, she knows and feels that they are instinct with a force which will be stronger than any other in deciding the destiny of her child. Out of the love of that little palpitating heart, over which she watches, what floods of happiness or depths of sorrow may come! Out of its hate what bitterness and ruin! And yet from hating only that which is vile, and base, what strength of upright purpose! What help to the injured and oppressed!

What the child learns to love it will follow after, and hold by. In this fact we see the importance of making religion lovely and attractive to the young, not wearisome or repulsive. All the offices and duties of religion also should be strenuously recommended, so far as is possible to the affectionate choice of a child; and where this is not possible, the habit of observing that the parents love these duties, and fulfil them faithfully, and

cheerfully, will go a long way towards making the child feel that there must be something good and lovely in them, although it may be too young to perceive and understand the good itself.

The reading of Scripture stories, if well selected, is a great help in this kind of teaching; and here especial truthfulness should be observed; as indeed we find it in the stories themselves, where none of the brightest in example, or the most honoured as the servants of God, are spared the penalty of having their faults, or even their worse than faults, recorded. Such, however, is the faithfulness of these lessons of instruction that we find in them the sad consequences of wrong-doing both in appropriate, and sometimes immediate punishment, and in the bitter repentance of the wrong-doer.

In works of fiction we seldom find this equal justice. More frequently we meet with characters represented as wholly good, or wholly bad, neither of which afford much instruction either to youth or age. Biographies of good people, too, are sadly defective in this respect. Where all the wrong is left out, and where it is only sparingly touched upon, they do not teach a true lesson. Children are quick to perceive that the representation is one-sided; and whatever we teach them, we must teach the truth—that is, so far as they can see and understand the matter at all, it must be set before them truly. They naturally love the truth, though they may not like to make it the rule of their own words and actions. Hence there is gain rather than loss, in showing them how a course of life, otherwise good and happy, may have been marred by yielding to the temptation to do wrong; and by showing them also what sad tears have sometimes been shed over the consequences of even a momentary act of passion, or of self-will.

It may seem a strange, and perhaps meaningless expression to make use of, but I know of none better than to say that a child should learn to love love itself—to hold love in the tenderest respect—nay, to reverence it as a holy thing. The worst degradation of human life is where love is degraded. The loftiest and purest height to which we are capable of reaching is where our love is fixed upon the highest things—highest because holiest. Of all the follies which prevail in social life, there is not a more debasing and pernicious folly than that of treating love with ridicule and contempt. Fair lips may do this, and voices that speak in silver tones may mock at those evidences of tenderness and true affection which ought at least to be sacred in the estimation of women. Whenever we meet with this hard, cruel, mocking tendency, instead of that warm and cordial enthusiasm which ought to fire the eye, and send a glow into the cheek of youth, we are led to ask, who touched the heart of that youth in early childhood?—who bent over its cradle?—who stilled its cries?—who called forth its merry laughter until it echoed from heart to heart and made the household ring with joy? Perhaps no one. Possibly the child was motherless, and so never learned the exquisite delight—the pure enjoyment—the loveliness of love.

There is no sadder spectacle presented by human life than that of a childhood thus uncherished in its sweet affections—thus restrained in its abounding and exuberant joy; for there is no real joy in childhood without the free exercise of love, given and received. A child whose affections are repressed is like a young tree with its buds picked off in spring-time. This act of picking off young buds is what many of us do thoughtlessly. Even the mother does it sometimes, to

her own unspeakable loss, and to the cruel injury of her child. It may be done even by the habitual manner of a parent who is indulgent and kind in greater matters. Our language has no polite word for describing a certain style of manner, which I can only call *snubbing*; and a system of constant snubbing is one of the most injurious to which youth can be subjected. Either the temper is made sullen and resentful, or hope is crushed within the heart, or energy is deadened for want of hope, or there creeps over all the faculties a kind of paralysis, or a general tendency to disease, which may become any or all those mental maladies which so often lie at the foundation of human misery.

On the other hand, a happy genial childhood, with the full flow of natural affection encouraged, and brought out into the open day without hindrance, and without shame, is perhaps the greatest boon which parents have it in their power to bestow upon their children. Instead of being timid about the exercise of love, not knowing whether it will be well received, let a child grow up and believe that love is welcome everywhere—the best thing it has to offer, and a glorious gift—that the giving of love is a generosity which it has a right to exult in; and where this feeling pervades a home, what confidence, what joy, what peace it brings! It is the very sunshine of their young lives to children; and they can no more grow and flourish so as to bud and blossom as they ought without breathing in an atmosphere of love, than the plants and trees of our gardens can flourish without the light and warmth of the sun himself.

Happily for the poor this is one point on which they stand at no disadvantage with the rich. Though stripped of so many other kinds of abundance, their homes may abound in love. They themselves may be liberal here; and while the family meal may be sparing, and even insufficient, they may disperse liberally to their children that true happiness which arises out of loving and being beloved.

In addition to these pleasant thoughts there is one of higher interest which the Christian mother may safely cherish in her heart. It is that the child which has been so nurtured as thoroughly to appreciate the beauty and the value of natural love in the exercise of home affection, will be more likely to receive, without questioning, nay, rather with cordial welcome, the story of that divine love which was manifested in the life and death of our Lord and Saviour Jesus Christ. The ready opening of the young heart to receive the impression, though dim at first, of the ineffable nature as well as the reality of this love, will, I believe, be found a better preparation for making that child a true Christian than much teaching of the head. At all events the two modes of instruction should be carried on with equal earnestness, only there is this difference, that the education of the heart may be commenced from the cradle, and that thus a foundation may be laid in human love for the more entire appreciation of that which is divine.

In the course of these remarks I have said little about hate. It is often said, perhaps without reflection, that those who cannot hate, cannot love. I suppose the true meaning of this saying is, that the warmth and force of feeling which manifests itself in ardent love will necessarily manifest itself at times in an opposite direction. However this may be, we must all, I think, allow that children do hate, in a certain sense at least. Their little acts of repulsion evince in a high degree the feeling of hatred, although with them the emotion is happily of transient duration, and for the most part easily overcome.

The difficulty with children is how to get the application of this feeling removed from persons to things, or rather from the actor to the act; and more difficult still is it to apply it to ideas, such as meanness, cruelty, and wickedness in general. To hate the sin, and love the sinner, is perhaps one of the most difficult attainments of Christian life. In how many cases it is never attained at all, is a question not necessary to ask here.

When the infant has become capable of feeling admiration and contempt, and when these emotions begin to manifest themselves, then the natural feeling of hate may be diverted into legitimate channels by showing the child the actual meanness of doing wrong—the base and contemptible nature of a lie, for example—the odious nature of greediness and theft; and so on, using up, as it were, the ebullitions of hate for purposes of condemning evil under every form.

It is no bad beginning of life for a child to hate a lie—to hate deceit, and treachery of every kind—to hate cruelty—in short, to hate whatever we know to be hateful in the sight of God, we have high authority in the Psalms of David, and in many other portions of Holy Writ, for believing that there is a power of detestation which may be lawfully used against what is right.

The world will do much to deaden these childish feelings; and what is more dangerous, it will do much to misplace them—to draw out love towards that which is not worth loving, and ought not to be loved, and to excite hatred where it would be better to pity, and sometimes to admire. This confusion of moral appreciation and purpose which abounds in the world, and which often pervades even what is called good society, renders the work of the mother one of more urgent necessity; and happily for her, there is affixed to the faithful performance of her task a twofold blessing, for in rightly educating the heart of her child, her own heart is made better.

ROMANCE OF HERALDRY.

BY THE EDITOR OF "DEBBETT'S HOUSE OF COMMONS,"

V.

THE noble families of Vane and Fane owe their arms and crest to a deed performed at the battle of Poitiers, *temp.* Edward III, by Sir Henry Vane, a gallant soldier who had the good fortune to participate personally in taking as prisoner John, King of France. Froissart in his Chronicles states that the King defended himself with great valour, though attacked by numerous knights, each of whom cried out, "Yield you, or you are dead." Sir Denyce Morbecke, however, happened to be next the king, and, addressing him in good French, asked him to yield; whereupon the monarch replied in the same language, "I yield me to you." All the knights then pressed round the captive king and made him acknowledge that each one had captured him. The claims, however, of Sir Roger de la Warre and Sir John Pelham have always been acknowledged to be the strongest, and the former received the crampet, or chape, of the king's sword, and the latter the buckle of the monarch's belt, a charge now borne in his arms by the Earl of Chichester, as commemorative of his ancestor's exploit. It was, however, to Sir Henry Vane that the fallen king gave his gauntlet, and in token of this circumstance the knight assumed as his arms azure, three sinister gauntlets, two and one or; and for his crest a dexter gauntlet erect, holding a sword, all proper, pommel and hilt or.

The Rev. Sir John Caesar Hawkins, Bart., bears for his arms argent, on a saltire sable, five fleur-de-lys or,

and they were probably assumed by an ancestor under the following circumstances. When King John of France was taken at the battle of Poitiers and detained a prisoner in England, the King of Navarre, availing himself of his absence, declared war against France, and, being aided by many knights, squires, and men at arms, whom he gained over to him by the great pay and bounty which he gave them, took many strong places and castles, and among others that of Mauconseil. This place he entrusted to the keeping of an Irish knight and two English squires, Franklyn and Hawkins, who had assisted at its capture. In memory of this the Hawkins family took for their arms a saltire, which represents one of the scaling-ladders by the help of which the castle was taken, while the fleur-de-lys betoken those which were on the captured ensign of France.

Sir Vere Edward de Vere's arms are quarterly gules and or, and in the dexter chief quarter a mullet argent. Tradition thus describes the origin of these insignia. In 1098, it is recorded that a battle was fought near Antioch, in Syria, between the Christian troops and those of the Corborant (*i.e.*, the noble of nobles) to the Sultan of Persia. The Christians were victorious, and pursued the vanquished soldiers. However, during the eagerness of pursuit night came on, and the Christians, being utterly ignorant of the country, were in danger of becoming dispersed, and of wandering too far from the city, when they would have fallen an easy prey to the greatly superior numbers of the enemy. But when they were only about four miles from Antioch a white star appeared, and shed its light especially upon the banner of Albry de Vere. By the guide of this star the army were enabled to regain the city; and all the warriors said that Albry de Vere was a holy man, and one beloved of God. In remembrance of the Divine favour thus marvellously shown him, De Vere placed the silver star as the solitary bearing on his shield; and after spending the vigour of his manhood in combating the enemies of the faith, he assumed the cowl in his old age, and entirely devoted himself to the service of the Church. The Earls of Oxford, which title is now extinct, were descended from Albry de Vere.

Sir Michael Hicks-Beach, the recently appointed Parliamentary Secretary to the Poor Law Board, bears as his second and third quarterings, gules, a bar wavy between three fleur-de-lys or. The fleur-de-lys refer to as many French standards as had been captured by Sir Elias Hicks, who was created a Knight Banneret in the reign of Edward III, and received the honour of knighthood at the hands of the Black Prince.

A cubit arm, holding a broken tilting spear, the crest of the present baronets Carmichael, refers to an exploit said to have been performed by their ancestor, Sir John Carmichael. This knight accompanied Archibald, Earl of Douglas, with a band of Scottish troops, to the assistance of Charles VI of France, and at the battle of Beaugé, A.D. 1421, dismounted the Duke of Clarence, brother of King Henry V, who commanded the English forces, and thereby materially contributed to their defeat. The Swintons, of Swinton Bank, however, assert that it was Sir John Swinton, and not Sir John Carmichael, who unseated the duke; and to this opinion Sir Walter Scott inclines, as in his "*Lay of the Last Minstrel*," he says:—

"Then Swinton placed the lance in rest,
That humbled erst the sparkling crest
Of Clarence's Plantagenet."

Sir Humphrey de Trafford's ancestor was a landowner in Lancashire at the time of the Conquest, and to disguise himself from the Norman soldiers he assumed the

garb of a thresher, and whenever he worked his flail, whether to the right or the left, he cried, "Now thus." And it is to commemorate this circumstance that the descendants of the old Saxon yeoman bear as their crest, a husbandman per pale, argent and azure, threshing, a garb or.

The present baronets, Sir Robert Anstruther and Sir Wyndham Carmichael Anstruther, use as their crest two sturdy arms in armour, brandishing a pole-axe, with the motto, "Periissem ni periissem" (I should have perished had I not gone through it). This alludes to an ancestor who, having fixed a friendly meeting with an adversary, discovered that the latter intended to assassinate him. Being forewarned he effectually prevented his enemy from fulfilling his purpose, by felling to the ground his would-be murderer.

The encroachments of the sea in England have at times been very serious. Evidence of this is found in the Goodwin Sands, which are said to have once been the estate of Earl Godwin, and also in that portion of the Cornish coast between the Land's End and the Seven Stones, which was once dry land belonging to the ancient family of Trevelyan. Tradition asserts that the latter mentioned land was suddenly submerged, and that the then owner of it, when upon a riding excursion, found himself cut off from the mainland, in a locality far removed from human habitations. Finding his position becoming momentarily more perilous, and night approaching, he determined to attempt to reach the shore with his horse by swimming. The distance was great, but his steed was strong and possessed spirit. So soon as the tide began to flow he started on his perilous journey, and at the very moment when he expected to be lost through the exhaustion of his steed, the noble animal touched land, and both he and his rider were saved. In commemoration of his gratitude to the horse, he ordered that the rest of its life should be one of rest and plenty, and he assumed in lieu of his former arms, gules, a demi-horse argent, hooped and maned or, issuing out of water in base, proper, the bearings of the present Sir Walter Calverley Trevelyan.

Sir Henry Thomas Tyrwhitt's family is said to owe their arms, and even name, to the undermentioned circumstance. In the reign of William I was a knight Sir Hercules, renowned for his valour and exceeding strength. On one occasion, when riding with a party of his retainers, he was attacked by a superior force, and to avoid, as they thought, defeat, his attendants fled across a neighbouring bridge, which afforded the only passage over a deep and rapid stream. They would not, however, have escaped had not Sir Hercules posted himself at the entrance to the bridge, and with a ponderous mace beaten off his foes. Shamed at seeing their leader fighting single-handed, they rallied and returned to the *mêlée* just as Sir Hercules, fainting from exertion and loss of blood, had rolled from the highway into a piece of marshy ground covered with rushes. His followers, however, could not readily have discovered his position, had not the clatter of his armour as he fell startled from their nest some tyrwhitts or pewits, whose shrill cries, as they flew in circles over the place where he lay, enabled the searchers to discover and revive him. To commemorate this circumstance Sir Hercules assumed the name of Tyrwhitt, placed upon his shield three pewits, and took for his crest the figure of his namesake, "Hercules" bearing a club, in memory of the great deeds which he had enacted with the mace.

At the battle of Edgehill, an ancestor of the present

Sir Atwell Kinglake, Bart., received sixteen wounds, one of which disabled his left arm. Unmindful, however, of his wounds, the gallant knight held the bridle in his mouth, and continued to fight vigorously. The crest borne by the present family of Lake represents a mounted chevalier holding a sword in his right hand, his left arm hanging down, and the bridle in his mouth.

"I will mak sicker," is the motto of Sir Charles Sharpe Kirkpatrick, who bears as his crest a hand holding a dagger, an ensign that had its origin in a deed which was once styled patriotism, but which would now be termed murder. Robert Le Bruce, having met a chieftain known as Red Comyn in the Greyfriars Church at Dumfries, argued with him upon political subjects. The disputants' tempers became aroused, and each used harsh expressions towards the other. Bruce, however, was unable to control his anger, and in his rage struck Comyn a blow with his dagger. Horror-struck, not at the deed he had committed, but at the place in which it had occurred, he rushed hastily out of the church, and was met by one of his staunchest adherents, Sir Thomas Kirkpatrick, of Closeburn, who, seeing his agitation, inquired the cause. "I doubt," said Bruce, "that I have slain Red Comyn." "Doubtest thou?" rejoined the knight, "then I will make sicker" (sure), and, entering the sacred edifice, he despatched the wounded man without hesitation.

A tower with a portcullis down, and the head and shoulders of a sentinel appearing above the battlements in a watching posture proper, with the motto "Turris prudentia custos" (Prudence is the guardian of the tower), is borne as his crest by the present Sir John Dick Lauder, Bart. It relates to the shelter which Sir Robert de Lauder, High Justiciary of Scotland, took in the Castle of Urquhart, after he found that the battle of Halidon was lost, A.D. 1333. The gallant knight subsequently so valiantly, skilfully, and successfully defended the castle against the attacks of the English, that the assailants were obliged to retire. His gallantry and prudence so pleased the King, David II, that he assigned to him the insignia above mentioned.

INDIAN DOG JOURNEYS.

EVERYBODY knows that in the snow-covered regions of North America our familiar friend, the dog, is promoted into harness, and becomes the draught animal *par excellence* of the human race. Pictures are found in each child's natural history book of wonderful sledges drawn by a riotous-looking assembly of dogs, which seem galloping away at their own irresponsible sweet will, unheeding the ineffectual lash of an owner located far to the rear. These popular ideas on the subject will bear a little enlightenment; especially when we have such good authority to produce as Professor Hind, of the Red River Exploring Expedition, who journeyed many a hundred miles behind the self-same dogs of draught.

It is among the Ojibbeways and their kindred tribes alone, that the canine species is thus honoured; elsewhere with the Indians the dog is utterly contemned and cruelly treated. Yet no worthier sacrifice can be offered at their festivals; and they have a saying that "the dog was created in heaven itself, and sent down especially as a gift to the Red men." The celestial gift, if it be so, is dishonoured every hour in the day—kicks and blows are its caresses, and its food whatever it can steal. Consequently it has a very seedy and ferocious aspect, suited to make war with men rather

than to serve them; or, as if it had a suspicion of the dire fact that it is sometimes slain and eaten at the ceremonials, half religious, half gluttonous, called Dog Feasts.

But the wandering prairie Indian has no usefuller chattel than the despised hound cowering at his wigwam door; who helps the squaws in their journeyings, dragging away on rude sledges the children, provisions, and birch-bark utensils of the camp. The woman walks by its side on snow shoes, and guides the vehicle with a cord. The beasts are harnessed to two poles jutting out in front of the long, flexible board which is the sleigh, and which is constructed so as to glide over inequalities of ground in an undulating, snake-like way; ropes along the sides, from end to end, keep the goods from overturning: thus, the young Swampys and Sioux papooses are transferred from place to place, with their parents' other property.

The carioles in which Professor Hind made his journeys were on the same principle of construction, or rather non-construction, a very thin plank, ten or twelve feet long, by twelve or fourteen inches broad, and turned up at one end in a half circle. On this is lodged a high cradle in which the traveller is packed up and deposited, a helpless mass of furs, with nothing but the thin plank between his outstretched legs and the snow. Nevertheless, he is very snug; his cradle is covered externally with buffalo-skin, and lined internally with blanket; and he sees before him, under the edge of his fur cap, his trio of dogs decorated with beadwork on their collars and tassels and bells on their harness. He has nothing to do with the management of these steeds; the driver runs behind, guiding the cariole by a loop of buffalo thong affixed to each corner of the projecting plank. His luggage is packed on a sledge coming after; and so he sits, a comfortable mummy, gliding or galloping along at the rate of fifty miles a day, through utterly roadless solitudes.

Perhaps the most celebrated run ever made with dog-trains, was that over the four hundred miles of country between Fort Garry on the Red River and Crow Wing on the Mississippi, the travellers being, on the one part, Lords Richard Grosvenor and Frederick Cavendish, with John Monkman as guide; on the other, Professor Hind and the Indian scout named Cline. The former had a superb train of fifty dogs for their sixteen carioles and sleighs—dogs which were known to have run sixty-eight miles in seven and a half hours, once upon a time. The need for so many vehicles was the carrying of provisions, not only for the travellers and their half-breed drivers, but also for the dogs, each of whom should daily get a meal of two pounds of pemmican or three pounds of whitefish. True, they could be left a week without food in an extreme case, but to keep them in travelling condition this regular meal was necessary. Mr. Hind had nine carioles and a corresponding proportion of dogs and men. The Hudson's Bay Company keep numbers of the animals trained at their forts for purposes of winter traffic.

Now the four hundred miles between Red River and the Mississippi was an untrodden waste of snow, not even a trace of a path marked anywhere. This was the most serious impediment in the proposed run. Generally in such cases a track has to be made by an Indian marching on snow-shoes some distance in advance of the dogs, who follow with unerring precision. And so John Monkman, the guide selected by the young noblemen aforesaid, astutely proposed to give Professor Hind and his party two days' start, and then, taking advantage of the trail they had left, to gain on them and sweep

past them into Crow Wing, the place of destination. The one weak point in this plan was the possibility of any fresh fall of snow obliterating the trail.

Twenty-two degrees below zero was marked on the thermometer when Mr. Hind camped out his first night—that of November 30. What intolerable cold! says the British reader in his well-curtained dining-room. The very description of the sleeping arrangements will make him shiver. No tent could be put up; canvas would be as a steel sheet in the morning; but a blanket was stretched on poles between the sleepers and the brilliant star-spangled sky. The snow had been swept away as a preliminary to kindling the fire, which was made of a long narrow shape, so that each man could lie with his feet towards it. Supper was prepared of pemmican and tea; and while getting ready, the dogs received their solitary feed for the twenty-four hours—the same as their masters, but without the tea. Then snow-shoes were doffed, and mocassins were dried, before each man wrapt himself in his blanket and slept. A promiscuous sleeping apartment that, in the midst of the solemn pine-woods; for the dogs crept in likewise to be near the fire, and some lay half across the Indians, whose coppery faces were whitened with frozen breath. Through the silent midnight came perchance the long, low howl of distant wolves, eyeing the red gleam of the bivouac from afar.

Long before any trace of dawn pales on the eastern horizon, there is a stir among the men, and the waning fire is replenished: breakfast over, the men draw on strong mittens of buffalo-hide, ere they proceed to catch and harness the dogs. For these are ungente animals, apt to snap at their masters and eat the thongs which strap them to the carioles; apt to grow sulky and lie like logs, only roused by severe punishment. Under the most favourable circumstance, this operation of catching and harnessing occupies more than two hours: so we see how needful it is that the camp should be astrid at five. Sometimes the roguish dogs have scraped out a bed in the snow, and if any has fallen afterwards during the night, it is next to impossible to detect their hiding-place: the beast will lie quietly within thirty yards of the fire, unheeding all shouts and calls, and it is only by the Indians walking round and round the camp in a circle, enlarging the limit each time, that they at last tread on the truant.

A good story is told of Cline, the guide, wanting to make a *cache* of pemmican somewhere, as store against his return by the same route. He knew that the cunning of the dogs was such, that they would scent it out and scrape it up if he buried it; he was most careful not to let them see where he was going when he struck off one day from the main route towards the Pine River. Here, having cut a hole through the ice, which was fifteen inches thick, and tied a buffalo thong round the bag of meat, and also round a stick from which he meant to suspend it, he laid the stick across the hole, so that the bag was let down into the water just below the ice: then he heaped blocks of ice on the opening, and poured water over all. Such was the cold that the water froze the instant it touched the ice, and thus a solid mass was formed over his *cache*, or hidden treasure. Raising his head from the work, Cline beheld the sharp noses of some of his dogs over the bank, which had been watching him all the time. Immediately they disappeared; but when he joined the train, he could easily detect the culprits by their consciously guilty demeanour. Cline pushed on for some miles: counted his dogs before supper, when they were all right: counted them again in the morning, when

some were missing: went back on snow-shoes to his *cache* at the Pine River, and found the discoverers of the preceding day scratching busily at the ice over his deposit.

The severest part of the journey was in crossing the lakes, where there was no protection whatever from the cold. It was but a short time before that a Roman Catholic missionary had been frozen to death on the Red Lake, when a snowstorm had come on: he died within two hundred yards of his home. The Indians could read the whole history of the struggle in his tracks, and enacted the same in a touching dumb show for Professor Hind. How the poor priest had run against the pitiless blinding tempest for awhile, had paused in exhaustion, had turned his back to gain breath, had knelt in prayer, had hastened onward again, had slipped and fallen, leaving the clutch of his fingers marked on the ice, had prayed again with clasped hands, had finally yielded to the stupefying cold, and lain down in the unwaking sleep. He was an Austrian, located at this place as missionary to the Indians.

On the borders of Cass Lake, just as the bivouac was formed, a distant yelp was heard, "Monkman's come!" and soon his dogs were fraternising with Cline's, unheeding the rivalry between their masters. Forty-four miles from their destination, the parties camped together, and rehearsed the several stories of their journeys. Their last night in the woods was that of 12th December: and next morning, forty minutes after the start, Monkman's party passed that of Professor Hind; flitting swiftly and almost noiselessly by over the white earth, through the illimitable pine-woods, under the brightening heavens. The run was twenty-six miles to dinner time, Cline keeping close upon Monkman's heels. A splendid gallop of twenty miles from that to Crowwing: all sloping ground to the levels of the Mississippi, along which the dogs careered with magnificent eagerness. Monkman's had the best of the race by a few yards: Lord Frederick Cavendish being first, and Professor Hind third of the carioles entering the town. Exciting and strange as was the run, we can fancy the travellers shaking the hoarfrost from their eyebrows, and crunching the icicles from their beards very contentedly in a civilised apartment with the weather shut out, and resorting with thankfulness to first-class carriages for the residue of their lives, while enjoying dog-trains only in remembrance.

Our arctic voyagers have owed much to dogs of draught. In those higher latitudes there is some difference as to the manner of training and the result when trained. Whereas the Ojibbeway Indian keeps his dogs in order by hurling a well-aimed stick, javeline-wise, at the offending head, the Esquimaux uses a whip twenty feet long in the lash, and has a whole vocabulary of cries for "right, left, turn, stop." Three of their dogs are said to be able to draw a sledge weighted with a hundred pounds, over a mile's space in six minutes. Nine of such beasts drew 1,611 pounds of stores from the Hecla to the Fury—laid up in ice-quarters—in nine minutes. From the time they ceased to be blind puppies they have been yoked; first to toy-sledges that would amuse a child, as breaking-in for graver work. With all their work they are poorly fed, and have the gaunt aspect of wolves in general. Captain Parry saw one eat a large piece of canvas, a cotton handkerchief, and part of a linen shirt with apparent relish. Still, with all their harsh treatment, they are faithful creatures, and the bravest of the brave: if a shaggy Polar-bear loom out of the snowy gloom as you sit in your sledge, you will see your whole team burst harness and have at him, though the foremost die in his embrace.

Varieties.

THE WHIP.—The Whip has an office. He has six or seven clerks and scouts. He has a private printing-press. But, above all, he has one responsible deputy, who is the real Whip, whose efficiency is the basis of every majority, upon whom he depends, who in reality is what Colonel Taylor or Mr. Glyn only seems. The present holder of this post (Mr. Vargas) has held it, if we mistake not, between thirty and forty years. It is not a highly-paid office. Yet upon the diligence and perfection with which its duties are fulfilled depends perpetually the fate of Ministries. Understand, the Whip does not, like the Patronage Secretary of the Treasury, go in and out of office with Ministers. The Whip who drummed up sixty too few for Mr. Disraeli this year is the same who the year before last drummed up eleven too few for Mr. Gladstone. He has no political feelings, or shows none. His one object in life is to get a good majority for whatever Government is in. At night he is at the House; in the daytime he is at an office in King-street. Thence proceed almost every day circulars to every supporter of the Government, telling them what there is to watch for in the Government interest. Besides these circulars there are many special messages on which he has to send his scouts. In fact, there are few places in London where more business is done or done quicker or at greater pressure than in this little King-street office.—*Court Journal*.

VALUE OF LAND NEAR LONDON.—The residence known as Branch Hill Lodge, at Hampstead, and 13a. 3r. 37p. of pasture and garden ground adjoining, were lately offered by auction at the Auction Mart. After a spirited competition, the lot was sold to a City wine merchant, for his own occupation, at £20,050. The late owner and occupier purchased the estate fifteen years ago for £10,000.—*City Press*.

THE ROBBER CRAB.—In the island of Niné, as in Samoa, the large robber crab (*Birgus latro*) is found in great numbers, and the natives are very expert in catching them. The sagacity of these crabs is surprising. A young man in my family, in Samoa, saw one up a cocoa-nut tree twenty-five feet high push down (not twist off as the natives do) a dark brown cocoa-nut; that is a nut in just such a state of ripeness as to be easily detached from its stalk; just such a one as a native would have selected. The habit of this crab is, after having thrown down a cocoa-nut from the tree, to descend, go to the nut and tear off with its strong claws the fibrous husk; then it re-ascends the tree with the nut, holding it by a bit of the husk which it leaves on for the purpose, and lets it fall upon a stone or rock to break it. It then again descends, either to feast upon the broken pieces or to carry them away to its hiding-place. Sometimes, instead of taking it up the tree again to let it fall upon a stone, it will gnaw, with its strong nipper-like claws, a large hole in the nut, beginning at the eye. If these crabs perceive themselves discovered up a tree by any person, they draw up their legs and claws, form themselves into a ball, drop down, and immediately endeavour to escape; or if discovered near a precipice they roll down it. They feed on other fruits beside the cocoa-nut; such as the candle nuts, nutmegs, figs, and many other kinds of rich and oily nuts and fruits. The trees yielding these are, at certain seasons, covered with them, feasting upon their fruits, and when thus found basket loads of them are taken. They go periodically into the sea, about the change and full of the moon, just before she rises."

—*Savage Island, by Rev. F. Powell, F.L.S.*

PUBLIC INCOME AND EXPENDITURE.—The total revenue for the year ended March 31, 1898, was £69,600,218 sterling. Of this sum £22,050,000 was derived from the Customs, £20,162,000 from the Excise, £9,541,000 from stamps, £3,509,000 from land and assessed taxes, £6,177,000 from the property tax, £4,630,000 from the Post-office, and £345,000 from Crown lands, the miscellaneous receipts amounting to £2,586,218. The total ordinary expenditure amounted to £71,236,241, £26,571,750 of which was for interest and management of the Permanent Debt, for terminable annuities, interest of Exchequer bonds, Exchequer bills, and Bank advances for deficiency, £1,893,898 for charges on the Consolidated Fund (the largest item of which was £672,559 for the Courts of Justice), and £42,770,593 for supply services, £15,418,581 of which was required for the army, £11,168,949 for the navy, £8,491,314 for miscellaneous civil services, and £2,000,000 for the Abyssinian expedition.

THE LOST SHIP.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER IV.

We had got our decks caulked, our rigging set up, and other repairs finished, when, one forenoon, O'Carroll, who had at length ventured on shore, returned in a great hurry with the information that there was much bustle on board the *Mignonne*, and that her people were evidently hurrying to the utmost to get ready for sea. Had Captain Hassall followed his own inclinations, he would have given the piratical Frenchman the opportunity of trying his strength with the *Barbara*; but as

that would have been decidedly objected to by Garrard, Janrin, and Co., we, with the whaler and her prize, and another English vessel, cleared out as secretly as we could, and, with a fair breeze, put to sea. We had to lay to for the other vessels, and after they had joined us, Captain Brown hailed us, to say that the look-out from his maintopgallant mast-head had seen a large ship coming out of the harbour under all sail, and that he thought it possible she might be the *Mignonne*. As, however, a mist had soon afterwards arisen, she was concealed from sight. We promised, however, to stand to the northward with Captain Brown

during the night, and in the morning, should no enemy be in sight, let him and his consorts proceed on their voyage homewards, while we kept on our course for the Cape of Good Hope. Nothing could have given our people greater satisfaction than to have found the Frenchman close to us at daybreak. I spent most of the night in writing letters home, to send by the whaler. When morning dawned, not a sail, except our own little squadron, was to be seen. We kept company till noon, and then, with mutual good wishes, stood away on our respective courses. We hoped that the *Mignonne* would follow the *Barbara* rather than our friends, should she really have sailed in chase of any of us. The possibility of our being pursued created much excitement on board. At early dawn, till the evening threw its mantle over the ocean, we had volunteers at the mast-heads looking out for a strange sail. At the end of four or five days all expectation of again meeting with the *Mignonne* ceased, somewhat to the disappointment of most of the crew, who were wonderfully full of fight. Having beaten the Frenchman once, they were very sure that they could beat him again. We had other good reasons for having our eyes about us—first, to avoid in time any foe too big to tackle; and then as we had the right to capture any Spanish vessels we might fall in with, to keep a look-out for them. However, the ocean is very broad, and though we chased several vessels, they all proved to be Portuguese. After sighting the little rocky and then uninhabited island of Tristan D'Acunha, we made the Cape of Good Hope, and entering Table Bay, dropped our anchor off Capetown.

The colony had lately been recaptured from the Dutch by Sir David Baird and Sir Home Popham, with a well-appointed force of 5,000 men. The two armies met on the plain at the foot of Table Mountain; but scarcely had the action been commenced by General Ferguson, at the head of the Highland Brigade, than the wise Hollanders, considering that the English were likely to prove as good masters as the French, retreated, and soon after offered to capitulate, which they were allowed to do with all the honours of war. The Dutch, French, and English were now living on very friendly terms with each other. The Cape colony, with its clean, well-laid-out English capital, its Table Mountain and Table Cloth, its vineyards, its industrious and sturdy Boers, its Hottentot slaves, and its warlike Caffirs, is too well-known to require a description. I did a good deal of trading—a matter of private interest to Garrard, Janrin, and Co., so I will not speak of it. The ship was put to rights, we enjoyed ourselves very much on shore, and were once more at sea. Strong easterly winds drove us again into the Atlantic, and when we had succeeded in beating back to the latitude of Capetown, the weather, instead of improving, looked more threatening than ever. I had heard of the peculiar swell off the Cape, but I had formed no conception of the immense undulations I now beheld. They came rolling on slow and majestically, solid-looking, like mountains of malachite, heaving up our stout ship as if she were a mere chip of deal cast on the face of the ocean. We were alone on the waste of waters, no other objects in sight besides these huge green masses, which, as the clouds gathered, were every instant becoming of a darker and more leaden hue.

"We shall get a breeze soon, and I hope that it will be from the right quarter for us," I remarked to Benjie Stubbs, the second mate, who had charge of the deck.

"We shall have a breeze, and more than we want,

Pusser" (intended for Purser, a name Benjie always persisted in giving me), he answered, glancing round the horizon. "You've not seen anything like this before, eh? A man must come to sea to know what's what. There are strange sights on the ocean."

"So I have always heard," I remarked.

"Yes, you'd have said so if you had been on deck last night in the middle-watch," he observed, in a low tone.

"How so! what happened?" I asked.

"Why, just this," he answered. "There was not more wind than there is now, and the sky was clear, with a slice of a moon shining brightly, when just as I was looking along its wake, what did I see, but a full-rigged, old-fashioned ship, under all sail, bearing down towards us at a tremendous rate. When she got within a couple of hundred fathoms of us, she hove to and lowered a boat. I guessed well enough what she was, so, running forward, I cast loose one of the guns and pointed at the boat. They aboard the stranger knew what I was after; the boat was hoisted in again, and away she went right in the teeth of the wind."

"Did you see this last night?" I asked, looking the mate in the face. "I should like to speak to some of the men who saw it at the same time."

"I don't say all saw it. You may ask those who did, and you won't get a different story from what I've told you," he replied.

"And what think you was the ship you saw," I asked.

"The Flying Dutchman,* of course, and no manner of doubt about the matter," he answered promptly. "If you had been on the look-out you would have seen him as clearly as I did. Remember, Pusser, if you ever fall in with him, don't let him come aboard, that's all. He'll send you to the bottom as surely as if a red-hot shot was to be dropped into the hold."

"Who is this Flying Dutchman?" I asked, wishing to humour Benjie by pretending to believe his story.

"Why, as to that, there are two opinions," he answered, as if he was speaking of authenticated facts. "Some say that he was an honest trader, that he was bound in for Table Bay, when he was ordered off by the authorities, and that, putting to sea, he was lost; others say that he was a piratical gentleman, and that on one occasion, when short of provisions, being driven off the land by contrary winds, he swore a great oath that he would beat about till the day of doom, but that get in he would. He and all his crew died of starvation, but the oath has been kept; and when gales are threatening, or mischief of any kind brewing, he is to be met with, trying in vain to accomplish his vow."

I smiled at Benjie's account, whereat he pretended to look very indignant, as if I had doubted his veracity. I afterwards made inquiries among the seamen. Two or three asserted that they had witnessed an extraordinary sight during the night, but they all differed considerably in their accounts. It may be supposed that they were trying to practise on the credulity of a greenhorn. My belief is that they really fancied that they had seen what they described.

The clouds grew thicker and thicker till they got as black as ink. The sea became of a dark leaden hue, and the swell increased in height, so that when we sank down into the intermediate valley, we could not see from the deck beyond the watery heights on either side of us.

* We never hear of the Flying Dutchman now-a-days. The fact is that he had the monopoly of sailing or going along rather in the teeth of the wind. Now steamers have cut him out, and he is fain to hide his diminished head.

"Ah, the skipper is right; we shall have it before long hot and furious."

This remark, made by Benjie Stubbs, followed the captain's order to send down all our lighter spars, and to make everything secure on deck, as well as below. The ship was scarcely made snug before the tempest broke on us. The high, smooth rollers were now torn and wrenched asunder as it were, their summits wreathed with masses of foam, which curled over as they advanced against the wind, and breaking into fragments, blew off in masses of snowy whiteness to leeward. I scarcely thought that a fabric formed by human hands could have sustained the rude shocks we encountered till the ship was got on her course, and we were able to scud before the gale. Often the sea rose up like a dead wall, and seemed as if it must fall over our deck and send us to the bottom. The scene was trying in the day time, but still more so when darkness covered the face of the deep, and it needed confidence in the qualities of our ship, and yet greater in God's protecting power, not to feel overcome with dread. There was a grandeur in the spectacle which kept me on deck, and it was not till after the steward had frequently summoned me to supper that I could tear myself from it. Curious was the change to the well-lighted, handsome cabin, with the supper things securely placed between fiddles and puddings* on the swing table. The first mate had charge of the deck. Stubbs was busily employed fortifying his nerves. "You now know, Pusser, what a gale off the Cape is," he observed, looking up with his mouth half full of beef and biscuit.

"Yes, indeed," said I. "Fine weather, too, for your friend the Dutchman to be cruising."

"Ay, and likely enough we shall see him, too," he answered. "It was just such a night as this some five years back that we fell in with him off here; and our Consort, as sound a ship as ever left the Thames, and all hands was lost. It's my belief that he put a boat aboard her by one of his tricks." I saw Captain Hassall and Irby exchange glances. Stubbs was getting on his favourite subject.

"Well, now I've doubled this Cape a dozen times or more, and have never yet once set eyes on this Dutch friend of yours, Benjie," exclaimed O'Carroll. "Mind you call me if we sight his craft, I should like to 'ya, ya' a little with him, and just ask him where he comes from, and what he's about, and may be if I put the question in a civil way I'll get a civil answer." By-the-bye, Captain Hassall and I had been so well pleased with O'Carroll, and so satisfied as to his thorough knowledge of the regions we were about to visit and the language of the people, that we had retained him on board as supernumerary mate.

"Don't you go and speak to him now, if you value the safety of the ship, or our lives," exclaimed Stubbs, in a tone of alarm.

"You don't know what trick he'll play you if you do. Let such gentry alone, say I."

We all laughed at the second mate's earnestness, though I cannot say that all the rest of those present disbelieved in the existence of the condemned Dutchman. The state of the atmosphere, the strange, wild, awful look of the ocean, prepared our minds for the appearance of anything supernatural. The captain told me that I looked ill and tired from having been on deck so many hours, and insisted on my turning in, which I at length unwillingly did.

In spite of the upheaving motion of the ship, and the peculiar sensation as she rushed down the watery declivity into the deep valley between the seas, I fell asleep. The creaking of the bulkheads, the whistling of the wind in the rigging, the roaring of the seas, and their constant dash against the sides was never out of my ears, and oftentimes I fancied that I was on deck witnessing the tumult of the ocean, now that the Flying Dutchman was in sight, now that our own good ship was sinking down overwhelmed by the raging seas.

"Mr. Stubbs wants you on deck, sir; she's in sight, sir, he says, she's in sight," I heard a voice say, while I felt my elbow shaken. The speaker was Jerry Nott, our cabin-boy. I slipped on my clothes, scarcely knowing what I was about.

"What o'clock is it?" I asked. "Gone two bells in the morning watch," he answered. I sprang on deck. The dawn had broke. The wind blew as hard as ever. The sky and sea were of a leaden grey hue, the only spots of white were the foaming crests of the seas and our closely reefed foretop sails. "There, there! Do you see her now?" asked Stubbs, pointing ahead. As we rose to the top of a giant sea I could just discover in the far distance, dimly seen amid the driving spray, the masts of a ship with more canvas set than I should have supposed would have been shown to such a gale. While I was looking I saw another ship not far beyond the first. We were clearly nearing them.

"What do you think of that?" asked Stubbs.

"That there are two ships making very bad weather of it, Mr. Stubbs," answered the captain, who at that moment had come on deck. He took a look through his glass.

"She is a large ship—a line-of-battle ship I suspect," he observed.

"Looks like one," said Stubbs. "She'll look like something else by-and-by."

The rest of the officers had now joined us except Mr. Randolph, who had the middle watch. We were all watching the strangers together. Now as we sank down into the hollow, the masses of spray which blew off from the huge sea uprising between us and them, hid them from our sight. Some differed with the captain as to the size of the largest ship. One or two thought that she was an Indiaman. However she was still so distant, and in the grey dawn so misty-looking and indistinct, that it was difficult to decide the question. The captain himself was not certain. "However, we shall soon be able to settle the matter," he observed, as the Barbara, now on the summit of a mountain billow, was about to glide down the steep incline. Down, down, we went—it seemed that we should never be able to climb the opposite height. We were all looking out for the strangers expecting to settle the disputed point. "Where are they?" burst from the lips of all of us. "Where, where?" We looked, we rubbed our eyes—no sail was in sight. "I knew it would be so," said Stubbs, in a tone in which I perceived a thrill of horror. O'Carroll asserted that he had caught sight of the masts of a ship as if sinking beneath the waves.

"Very likely," observed Stubbs, "that was of the ship he was sending to the bottom, the other was the Dutchman, and you don't see her now."

"No, no, they were craft carrying human beings, and they have foundered without a chance of one man out of the many hundreds on board being saved," exclaimed the captain.

Stubbs shook his head as if he doubted it. We careered on towards the spot where the ships had gone down, for that real ships had been there no doubt

* Contrivances to prevent articles falling off a table at sea.

could be entertained. A strict look-out was kept for anything that might still be floating to prove that we had not been deceived by some phantom forms. Those on the look-out forward, reported an object ahead. "A boat! a boat!" shouted one of them. "No boat could live in such a sea," observed the captain. He was right. As we approached, we saw a grating to which a human being was clinging. It was when first seen on the starboard bow, and it was, alas! evident that we should leave him at too great a distance even to heave a rope to which he might clutch. By his dress he appeared to be a seaman. He must have observed our approach; but he knew well enough that we could make no attempt to save him. He gazed at us steadily as we glided by—his countenance seemed calm—he uttered no cry—still he clung to his frail raft. He could not make up his mind to yield to death. It was truly a painful sight. We anxiously watched him till we left the raft to which he still clung far astern. No other person was seen, but other objects were seen, floating spars, planks, gratings to prove that we were near the spot where a tall ship had gone down. "It is better so," observed the captain, "unless the sea had cast them on our deck we could not have saved one of them." We rushed on up and down the watery heights, Stubbs as firmly convinced as ever that the Flying Dutchman had produced the fearful catastrophe we had witnessed.

On we went—the gale in no way abating. I watched the mountain seas till I grew weary of looking at them; still I learned to feel perfectly secure—a sensation I was at first very far from experiencing. Yet much, if not everything, depended on the soundness of our spars and rigging: a flaw in the wood or rope might be the cause of our destruction. I went below at meal-time, but I hurried again on deck, fascinated by the scene, though I would gladly have shut it out from my sight. At length, towards night, literally wearied with the exertion of keeping my feet and watching those giant seas, I went below and turned in. I slept, but the huge white crested waves were still rolling before me, and big ships were foundering, and phantom vessels were sailing in the wind's eye, and I heard the bulkheads creaking, the wind whistling, and the waves roaring as loudly as if I was awake; only I often assigned a wrong cause to the uproar. Hour after hour this continued, when, as I had at last gone off more soundly, a crash echoed in my ears, followed by shrieks and cries. It did not, however, awake me. It seemed a part of the strange dreams in which I was indulging. I thought that the ship had struck on a rock, that I escaped to the shore, had climbed up a lofty cliff on the summit of which I found a wood fire surrounded by savages. They dragged me to it—I had the most fearful forebodings of what they were about to do. Then I heard the cry, "Fire! fire!" That was a reality—the smell of fire was in my nostrils—I started up—I was alone in the cabin. The ship was plunging about in an awful manner. I hurried on my clothes and rushed on deck. Daylight had broke. The ship lately so trim seemed a perfect wreck. The foremast had been carried away, shivered to the deck, and hung over the bows, from which part of the crew were endeavouring to clear it. The main and mizzen topmasts had likewise been carried away. Smoke was coming up the fore hatchway, down which the rest of the people were pouring buckets of water. I went forward to render assistance. The foremast had been struck by lightning, and the electric fluid, after shattering it, had descended into the hold and set the ship

on fire. We worked with the desperation of despair—should the fire once gain the mastery, no human power could save us. The sea was running as high as ever, it was with difficulty that the ship could be kept before it. I exchanged but a few words with my companions; a bucket was put into my hands, and I at once saw what I had to do. The smoke after a time had decreased, for as yet no flames had burst forth. "Now, lads, follow me," cried Randolph, the first officer, leaping below with his bucket and an axe in his hand. Irby and four men sprang after him. With his axe, the mate cut a way to get at the heart of the fire. We handed down buckets to his companions, who kept emptying them round where he was working. The smoke was still stifling. Those below could scarcely be seen as they worked amidst it. The bulkhead was cut through. The seat of the mischief was discovered. Flames were bursting forth, but wet blankets were thrown on them. The buckets were passed rapidly down. The smoke was decreasing. "Hurrah, lads! we shall have it under!" cried the first mate, in an encouraging tone. We breathed more freely. The fire was subdued. The peril had indeed been great. We had now to clear the wreck of the mast, which threatened to stave in the bows. "The gale is breaking," cried the captain, after looking round the horizon; "cheer up, my lads, and we shall do well!" Encouraged by the captain the men laboured on, though from the violent working of the ship it was not without great difficulty and danger that the mass of spars, ropes, and canvas, could be hauled on board or cast adrift. As a landsman my assistance was not of much value, though I stood by clinging to the bulwarks, to lend a hand in case I should be required.

While glancing to windward, as I did every now and then, in hopes of seeing signs of the abatement of the gale, I caught sight of what seemed the wing of an albatross, skimming the summit of a tossing sea. I looked again and again. There it still was as at first. I pointed it out to the captain. "A sail running down towards us," he observed; "it is to be hoped that she is a friend, for we are in a sorry plight to meet with a foe." The captain's remark made me feel not a little anxious as to the character of the approaching stranger. After a time it became evident that the wind was really falling. The wreck of the mast was at last cleared away, but a calm sea would be required before we could attempt to get up a jury-mast. We had watched the approach of the stranger: she was steering directly for us. As she drew nearer I saw O'Carroll examining her narrowly through the glass. "Here comes the Flying Dutchman again," I observed to Stubbs.

"Not at all certain that she isn't," he answered, quite in a serious tone.

"No, she's not that, but she's ten times worse," exclaimed O'Carroll; "she is the Mignonne, as I am a seaman, and will be bothering us pretty considerably, depend on that."

We heartily hoped that he was mistaken, but certainly she was very like the craft we had seen at St. Salvador. She passed us as near as the heavy sea still running would allow her to do without danger to herself. A man was standing in the mizen rigging. I caught sight of his face through my telescope. I thought that I distinguished a look of satisfaction in his countenance as he gazed at us. "That's La Roche; I know the villain," cried O'Carroll; "I thought from what I heard that he was bound out here. He'll work us ill, depend on that." We now wished that the sea had continued to run as high as it had hitherto been

doing, when it would have been impossible for the privateer to have boarded us. It was now, however, rapidly going down, though as yet it was too rough to allow her to attempt to run alongside. It was possible that she might pass us. No. After running on a short distance her yards were braced sharp up, her helm was put down, she stood back with the evident intention of attacking our helpless craft.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

ALLAN CUNNINGHAM.

In some of these papers I have been led into greater length of introductory explanation than I intended at the offset, but I hope to make the *amende* by letting "Honest Allan," as he was commonly called, paint himself. I may say in brief that he was a self-educated, self-reliant, self-asserting man, open hearted and straightforward, with unusual sagacity and rare common sense.

When he came to London, with a local reputation, I was in literary harness, and among his earliest essays were certain poems recommended to my furtherance. In one of them I ventured to change a "who" for a "what," or something of equal importance, at which the writer was very indignant. I pointed out to him that his text was not grammatical, but he flew in the face of his *quasi* patron and critic, and declared he did not care a farthing for pronouns, or grammar, and "Nobody shall alter a word of mine, whether they may call it right or wrong!" *Nemo me impune lacessit*, was sturdy from Dumfries; and quite in unison with the stalwart Scot who acted upon it.

Ah, but seven years' up-hill work with the London Press tried his bravery. The first letter I have to quote tells an anxious tale.

Belgrave Place, 16 October, 1827.

DEAR JERDAN,—I venture to enclose you a notice of a new work of mine. I have no desire that you should abide by any words but such as you like, therefore dress it up in your own manner if you please. Some such notice before publication will be useful; nor would a little kindness from critics afterwards be at all amiss. God knows I have much need of a kind word or two, for I have been working hard up hill these many years, and William Jerdan and Sir Walter Scott have been almost my only friends. I acknowledge they have been good ones.

Yours very truly,
ALLAN CUNNINGHAM.

I have only to note that Lockhart, as well as Scott, was his constant and active friend, through all his struggles; no slackness was ever found in either, and his works and his family owed (and always gratefully acknowledged) much to the cordial services of both. Two years later a stronger standing had been obtained, and the annexed is a circumstantial notice of one of the steps.

27, Belgrave Place, 14 July, 1829.

MY DEAR FRIEND,—My little book has caught the eye of the trade, and, thanks to your kind notice, the eye of the public, and I expect it will do my name a good turn. If you could spare space for an extract or two my fortune would be made.

I have descended from the painful elevation of editor to Mr. Sharpe's publication, and my mantle has fallen on very able men, Maginn and Hook. In truth the proprietor was a little too changeable for me. He had altered the character of the work twice, and was resolved on a third experiment; so I quitted it, and here I am rejoicing in the fullness of freedom, and dispersing, with all the wisdom I am master of, a mountain mass of prose and verse which has accumulated these nine

months. It will probably save me from the affliction of a hundred letters if you will announce my *descent* to the world—in words like these:—

"We are authorized to state that in consequence of the Anniversary being altered from an embellished annual to a regular monthly magazine, Mr. Allan Cunningham has ceased to be editor."

Dear Sir,
Yours faithfully,
ALLAN CUNNINGHAM.

My next tends to a very different phase.

27, Belgrave Place, 31 May, 1830.

MY DEAR FRIEND,—I send you another of my little books. It has cost me much research and enquiry, and is still very imperfect, I fear. I think you will like the *Life of Flaxman*; and that you may dislike none of it is the wish

Of your very faithful friend,
ALLAN CUNNINGHAM.

And *hinc illæ lachrymæ*. Witness the next.

Belgrave Place, 23 February, 1831.

DEAR SIR,—I never, save once, ventured to complain or remonstrate when any of my works happened to be abused or neglected, and for that piece of impudence I was most unhand-somely mauled. Whatever the merits or faults of my books may be, I have ever allowed matters to take their course, satisfied that if they were founded in nature and truth, they would live at least for a time. I believe, too, I can say truly that without ever mixing myself up with the one-sided feelings of any critical publication, I have, nevertheless, done many kind acts to fellow labourers, both in verse and prose. Of this I am sure that I never did an unbrotherly act to any one. I may also add without much fear of contradiction, that while I have lived to see the works of many well-educated men make a stir for a time and then perish quietly, the humble name which I have acquired in literature has risen rather than sunk, in spite of all the disadvantages under which I laboured.

Why do I mention all this? I do it because I am pestered daily with the condolences of friends on my having incurred your displeasure, which they argue is visible enough from the brief and slighting way in which you mentioned my *Lives of the Architects*. If you really are displeased with me you are man enough to say so, and I am man enough to make you the necessary reparation, if such be needed. I have never given you the least cause of offence, and I have often spoken well of you when some were not disposed to show your name any favour. Finally, if your slighting notice of the book has arisen from some sudden dislike which you have taken up against me, then I say you are my enemy without cause. If it proceeds from your unfavourable opinion of the volume, I have nothing to say but to bow to your decision, and live in hope of doing better another time.

I remain, my dear friend,
Yours ever,
ALLAN CUNNINGHAM.

"Dear Jerdan," and "my dear friend," had evaporated, and the *irritable genus vatum* could only recognise a formal "dearsir" to lacerate. On the subject suffice it to say that my *honest* opinion was not so favourable to the work as, for the author's sake, I heartily wished it to have been; and with a candid explanation, the "better time" hoped for very speedily arrived. The "friendship dear" on both sides was soon restored, and the affectionate "dear Willie" crowned the whole, and lasted to the last. Witness the following interesting account of the writer's poetical aspirations:—

27, Belgrave Place, 22 March, 1832.

MY DEAR FRIEND,—I have written a poem, "*The Maid of Eivar*" by name, in twelve parts, and have sent it to the press. The scene is laid on the Border, the time is the early part of the reign of Queen Mary, and my wish has been to give an image of pastoral and domestic life during those stirring times when a reformation of religion on one hand, and hostility with England on the other, brought much sorrow to the land. I have endeavoured to work up the whole story from my own feelings and observation, and have hopes that it will do me a good turn. I have not published any poetry, save now and

then a song, for these twelve years, and trust to have a few listeners, though my name in literature is not high. I have mentioned this to you with the hope that you will notice my undertaking, so that I may have the benefit of publicity at least before I come from Moxon's Press.

Yours very truly,

ALLAN CUNNINGHAM.

To William Jerdan, Esq.

I need hardly refer to Cunningham's previous poetical productions. His happy tinkering of several ancient ballads, and his capital imitation of others, together with his pieces of an entirely original kind, had laid a foundation of fame, which, in truth, was not much enlarged by this new effort, though replete with many beauties which ought not to be forgotten. But to proceed: in the ensuing year he commenced his separate biographies; he got ready and published his "Life of Burns," which reached a second edition, which he thus describes—

27, Belgrave Place, 15 August, 1833.

MY DEAR JERDAN,—Will you have the goodness to say to the world, in your own time and way, that I have a new edition and a new Life of Burns in hand. His works have been heretofore ill arranged; the natural order of composition has been neglected; poems have been printed as his which he never wrote, and his letters have had the accompaniment of epistles which were not necessary, and were the work of other hands. Poems, letters, and anecdotes, hitherto unpublished, are in my possession, and will appear in the course of the work. My desire is to arrange the poems, letters, songs, remarks, and memoranda of the bard, in a natural and intelligible order; to illustrate and explain them with introductions and notes, and to write a full and ample memoir such as shall show his character as a man, and his merits as a poet, and give freely and faithfully the history of his short and bright career. The whole will extend to six volumes; the first will contain the life, the others the letters, poems, songs, &c., and each volume will be embellished with two landscape vignettes from scenes made memorable in his works, both in Ayrshire and Dumfries. The work is in great forwardness, and will be published in monthly volumes.

Yours ever,

ALLAN CUNNINGHAM.

[The letter ends with news of family good fortune, and with some compliments in the warmest strain of the writer's warm heart.]

With this assurance I close the examples of our correspondence as completing the portrait I have endeavoured to make up out of these traits; but it was four years later, viz. in 1837, that in writing of a work by Sir Andrew Halliday, he arrived at "my dear Willie," and evinced the *perferendum Scotorum ingenium*, by saying, "Sir Andrew is a warm-hearted, true-hearted Scot, and surely another, with a heart equally warm and true, will find some kindly words for him." O, flattering "honest Allan"!

I now hasten to conclude. His "Life of Wilkie" followed his "Life of Burns," and he pursued a persevering literary occupation, till relieved from all his labours in 1842—sinking, as it seemed prematurely, the strong, athletic, powerful man, before he had attained more than fifty-seven years. For all the later division of his life (as will be seen from the dates of his letters), he resided near the studio of Sir Francis Chantrey, in relation to whom he occupied a position most suitable to his pursuits and habits, and congenial to his taste. As factotum to the famous sculptor he superintended his works at home, and was his active friend on all occasions abroad, where his interests were concerned. In this capacity he rendered him very important services, and I may whisper that his connection with the press did not diminish their efficiency. Founded on the basis of admiration of his genius, and personal and grateful

esteem, there was nothing but honourable action in the conduct on both sides; and I will state it as it appeared to me, that no selfish motives overruled the independence either of the employer or the employed.

Looking at the two it amused me to fancy that if the principal fitted Leslie for his Sancho Panza, in the capital picture with the Duchess, the second on the scene might (with such modifications as the artist could make) have stood, not sat, for the Don; for though too stout and good-looking for the chivalrous knight of La Mancha, he was at any rate tall enough, and could have been painted gaunt to realize the transformation!

TWO MONTHS IN SPAIN.

IX.—BARCELONA.

BARCELONA should have been the capital of the nation, and I think it the only city in Spain where the stranger may be reconciled to take up his abode for any length of time. There is more life and more activity, and desire for "radical reform" and progress here than I have witnessed in any other part of Spain. The city has been called the Manchester of Spain, but this is scarcely a compliment to either city. The cloth and cotton manufactories here are on a comparatively small scale, and protected by a high tariff, at the general expense of the community, who have to pay a high price for an inferior article, while native productions, which would give healthy labour, and be profitable to the nation and to individuals, are comparatively neglected. On the other hand, the air and climate refuse to acknowledge the black chimneys, and humming, busy, dingy mills of Manchester, the towers and spires standing out like marble in the clear atmosphere.

Barcelona has its east and west end, divided by a broad avenue called "the Rambla." The word has nothing to do with our rambles, but is the Arab *raml*, which means a river bed, and is often used in Spain for a road which traverses the dried bed of an old river. This broad street is not unlike the Unter der Linden at Berlin. It intersects the town from north to south, and is carried out one and a half miles beyond the town to Gracia on the north, where it is called the Paseo de Gracia; and to the south, along the harbour, the line is continued on a broad raised terrace or rampart leading to the citadel, and terminating in the public garden and evening drive and promenade—about as like Manchester as our November fogs and smoky atmosphere are to their light air and blue sky.

The sea wall that skirts the harbour is the favourite promenade, and after a sultry day, the cool sea breeze, and the beautiful scenery around makes this terrace a most delightful lounge. On the one side is a succession of palatial buildings, public and private, including the Casa Lonja, or Exchange, a curious mixture of architecture and art, most interesting to the stranger, while on the other hand is the fine harbour, protected by a semicircular mole and filled with vessels, while beyond white sails are seen studded along the bright blue Mediterranean.

The town is protected—I should say awed—by a large and powerful citadel, not unlike that of Fort William on the river Hooghly, and in the best style of Vauban, the celebrated French engineer. On the opposite side of the harbour, to the S.E., crowning an abrupt hill of 500 feet above the sea, stands the Castle of Monjuich, strongly fortified, and looking almost impregnable. Both this and the citadel are strongly garrisoned, to curb the *pronunciamientos* of the restless

reforming Catalonians. Ascending this hill by a zigzag road, we get a commanding view over the Mediterranean, and the town, bay, and surrounding country. The town was formerly surrounded from sea to citadel by a strong wall, bastions, and gates. A great part of these have been pulled down and built upon, and the great reformer of the 19th century has spread his iron arms over the foundations of the walls, and the great bastions have become railway stations. I have my room on the second floor of the hotel "Cuarto Naciones," on the Rambla, adjoining the theatres, post-office, and principal public buildings of the city. This broad and magnificent avenue, planted with rows of acacia, laburnum, and pepper trees, is one of the most animated scenes it is possible to imagine. At the moment of which I write it is Christmas day: the women have been at mass in their black dresses and lace scarfs; the men have come out to have a holiday, and enjoy their cigaretts in the open air; the booths and gambling tables are still active with excited purchasers and "operators"—a living panorama, moving up and down in every variety of colour and costume. The inhabitants are estimated at 160,000, but one would fancy there were nearly that number now in the streets.

With regard to national costumes, I may here remark that the upper classes are rapidly assimilating in dress to those of Paris. Among the peasants the old costumes still prevail, giving picturesqueness to their gatherings at fairs and festas. There is great variety in the dress of the different provinces. Contrast, for instance, the red cap and long pantaloons of the Catalan, with the close suit and jaunty hat of the Andalusian. Among all classes, however, the long cloth cloaks of the men, and the mantillas of the women, are still characteristic. Our illustrations give specimens of some of the peculiarities which mark the national costume. Since the suppression of the religious orders the usual clerical dress of the secular clergy is alone conspicuous. The military uniforms seem of wonderful variety.

The old town of Barcelona to the east of the Rambla forms an intricate maze of narrow winding streets; the houses are generally five stories, and many of them of very fine semi-Moorish architecture. These are intersected by a few broader streets, which the municipality is endeavouring to carry out still farther, as the old houses can be cleared away. The cathedral and all the principal churches are in this part of the town. On the west, or the new town, is one of those great markets which play so conspicuous a part in all Spanish cities, two large universities (civil and military), and several fine theatres. I am told it is a disputed question whether the principal theatre here, the Liceo (Lyceum), or La Scala, of Milan, is the largest and finest. The Barcelonese strongly claim the superiority for their house, and affirm that there never was a building where comfort, convenience, and the principles of light and acoustics have been so well and carefully carried out. This is the only city in Spain, with rare exceptions at Madrid, where the great stars of the opera condescend to appear. I should have given the churches precedence of the theatres, but they were so dark and gloomy that I could scarcely find my way through them: many of them are so rich and beautiful that one wishes they could be turned inside out under the bright clear sky. The Cathedral is one of the most magnificent specimens of the Gothic architecture of the fourteenth century that I have seen. The exterior, like many of the churches in Spain, has never been finished, and we must enter the building to

see its beautiful and elaborate decorations. It is in the form of a cross, 180 by 70 feet. The choir is placed in the centre, and this, with the stalls around, is one mass of wood carving and ornament, so beautiful in detail, and so grand and harmonious in the mass, that the eye is ever discovering some new object for admiration. The clusters of light and delicate columns that support the high pointed arches and lofty groined roof, and the rich painted windows, lighting up with their varied tints the dim interior, are all in the perfection of Gothic art. This Cathedral, like that of Cordova, has its fine patio, or open court, with orange, lemon, and other trees, with marble fountains and sparkling waters.

I have but slightly touched on ecclesiastical matters in these brief articles. I am not prone to "pluck the mote from my brother's eye." I know that there are good and virtuous Roman Catholics, who can find underneath and notwithstanding the mass of superstition and error, the faith and hope of the Gospel. It is not the opinion of individual Christians that I would question, but everyone must condemn the policy of the dominant Church, which, protected by the arm of the civil power, keeps the people wilfully in ignorance.

I remember being on a jury in Calcutta, some thirty-five years ago, in a case of murder, by some British soldiers. Fifteen young recruits, chiefly from Norfolk and Suffolk, were examined, of whom only four could write their names, and about eight could read imperfectly. Having been accustomed to a different state of matters among the Scottish peasantry, I was surprised, on inquiry, to learn that throughout these rich English counties not half the adult population could read and write. Those were days when "the school-master was not abroad." It is difficult to say what nation may "throw the first stone." We have much to be thankful for, if we are now tardily improving our national education. It is the misfortune of Spain that the spirit of the Inquisition so long prevailed to pervert the minds of men, or crush them, soul and body, under its iron hoof. It is this usurped authority that has made so many indifferentists and infidels in Spain and Italy, and perhaps elsewhere.

I was travelling on this journey with a Spanish gentleman from Cuba, a man of education and experience, and, I believe, a sincere Roman Catholic. He had his family at Madrid, under Roman Catholic teachers, and one of his sons was being educated for the church. He complained grievously of the Government of Spain, and made some favourable criticisms on the state of political and religious freedom in England and America. I asked him how it was that Spain, having confiscated most of the convents and religious houses, banished the Jesuits, and swept the monks and other religious orders out of the land, was still more Roman than the Romans; while indifference, and almost disrespect, were shown to the clergy, and the absence of men at the religious services, unless there was some musical attraction, was most marked? With the professions of liberality I so often heard from Spaniards, how was it the Pope's concordats were still in full force, and the people going hand in hand with the priest in excluding all Christianity that was not filtered through the Vatican, and the many books of instruction that would improve and enlighten their minds. "Your experience in England and America," I said, "must have shown you that this exclusive system is no security against infidelity. I, too, have been in America, and you must admit that there is no country in Christendom where there is more true piety, and charity, and every Christian virtue, than in the Northern States of America." His reply was short,

and, I think, conclusive. "You have not been long enough in Spain to understand the power and influence of the Church; three-fourths of the people are uneducated, and dependent on the advice of the priest, and even those who have some education, have been taught from their youth that there is no Christianity out of the Church of Rome—that to question the authority of the Church would entail eternal damnation, and that those persons calling themselves Protestants, with no end of annexes, do not believe in the divine mission of our Saviour, entirely ignore the Mother of God, and, in short, are in a worse position than Pagans. With this training and these impressions, they are ready at all times to co-operate with the clergy in excluding

some days he brought it back, saying that he had read it through with great surprise, and some shame for the injustice he had been taught to do us. He had no idea that Protestants believed what was in that book, which seemed to him to contain as much Christianity as their own Missal; but for family considerations he would not refer to the subject again.

For some years past the Government has allowed Protestant worship in the private apartments of the British Consuls. I had the privilege of hearing the English service at Madrid, Cadiz, Malaga, and Barcelona, from able and worthy representatives of our Protestant Church. The Sunday I passed at Seville we had no service. I learned that the privilege was withdrawn there in consequence of a complaint from the priests that some tracts had been distributed, or some attempt made to proselytize. The argument used for this measure we should scarcely understand in our free and happy country, but this extract from a noted Ultramontane paper may help to show the usual defence of the "right of the civil power to subserve the purposes of the Divine Will":—

"In countries unfortunately no longer exclusively Christian, religious, or rather irreligious, liberty must run riot, since it would be manifestly unwise or inexpedient to punish religious error, or unjust as affecting such as are wholly ignorant that they are guilty of heresy. But fortunately in Rome a state exists where the civil law subserves, as we maintain it ought to do, the purposes of the Divine Will, and where, in consequence, the liberty to offend God and to scandalise Christians by introducing false worship, is accorded to none. A Scotch Presbyterian clergyman, however, is not of our opinion, and feels exceedingly vexed in spirit that he is not allowed to assert in a Christian State, and

IN THE ALAMEDA AT MALAGA.

what they believe would contaminate their children, and bring punishment on the nation." Curiously enough these sentiments were confirmed afterwards by the chaplain of one of our consulates. A Spanish gentleman of good position was in communication with him, and learning that the chaplain was a married man, said, "What, a priest, and married? You cannot be a Christian priest." "Why not?" was the reply; "we can see nothing against marriage, nor was it forbidden to the priesthood till some centuries after the establishment of Christianity." Still the Spaniard insisted that we were not Christians, and that we denied all the doctrines that were essential to salvation. To cut the argument short my friend said, "If you will give me your word that you will not bring me into trouble with the priest or your family, I will lend you a copy of our Prayer-book in your own language, and if you will take the trouble to read it, you will find the Creed, the Lord's Prayer and Commandments, and even some of the prayers from your own Missal in this book." The Spaniard took the Prayer-book under a promise that he would keep it concealed, and after

SPANISH PRIEST.

proclaim from the centre of Christendom itself, in the teeth of Divine and human law, the abominable error that man has a right to teach false doctrine and to practise what false worship he chooses. But since Pius IX. will not tolerate in favour of a score or so of

Scotch Presbyterians a breach of divine and human laws, the *Times* takes up its cudgels in behalf of this Protestant chaplain. It is exceedingly wroth that the poor Romans, when sorely tempted, should not at least have a convenient opportunity at hand of committing the sin of heresy. In somewhat the same fashion Fagin, we suppose, could he have written a leader in the *Times*, would have given vent to his indignation that the jewellers at night put shutters on their windows and

THE CACHUCHA DANCE.

thus took away from such as were unwillingly honest a tempting opportunity of enriching their scanty store. This last act of the Papal Government brings out in bold relief the unworldliness of the Papacy, and its steadfast adherence to the doctrine peculiar to Christianity, that public heresy is a moral offence to be punished by law. As long as the scandal of a false worship in a Christian country is not obtruded on public notice, it may haply escape the arm of the law."

You have only to change the name of Rome for that of Spain, and the article will apply exactly to our present subject. I have dwelt longer on this point than I intended, but I wished to show, from the mouths of Spaniards themselves, or from Britons that had been long among them, the delusions under which this unhappy nation is kept by its guides and teachers.

The political position is equally sad; there is "no appeal from Philip drunk to Philip sober." "Our elections," said a Spaniard to me, "are a mockery; our legislative chamber a sham; our public debt has been a fraud on the nation; the Bourbons have filled up their cup of iniquity in Spain as they did in Italy; no intelligence or progress can exist where Crown and Church are determined to crush out every attempt at progress and liberal opinions." We know the result of all such governments, and when the deluge comes, and an uneducated people feel the weight of their oppression, how fearful may be the retribution. When I recall the lively scene before me, as I sat at my window that Christmas day, and think of this noble race of people, how very little

makes them happy, and how comparatively few are their wants, the unequalled beauty of their country with all its luxuriant productions, I feel inclined to draw my pen through any depreciatory remarks, and leave my readers to contemplate only the sunny side of Spanish life. But as these are the opinions of Spaniards themselves, and others who have resided long amongst them, I hope I may be pardoned if I give them a place in my record.

I feel it, however, an act of justice to Spaniards, as well as to my own countrymen who may visit this romantic and interesting land, to say that I have never travelled through any country with more confidence and safety. I had not once during my two months occasion to complain of rudeness or incivility. Few people appreciate the courtesies and amenities of life so fully as the Spaniards, and if the stranger will only exercise a little patience and forbearance, and reciprocate these amenities, he will have little to complain of. I have had many opportunities of studying, in a rapid way, the social, political and religious aspects of the country, and have conversed fully with well-informed Spaniards and English residents on these subjects. I see many noble qualities in the people, and a country of unbounded resources, if they had a fair chance in it. But the Spaniards are a conquered people, as much as the Hindoos and Javanese are, and conquered like them by ignorance, priestcraft, and superstition. Like the natives of South Italy they have been so long under an ecclesiastico-military despotism, that it will require a new generation to understand or appreciate the meaning of free institutions. Like the Italians also they are too apt to dream of the past, and forget the necessities of the present. If they would but humble their pride and condescend to "become as

BULL FIGHTERS.

little children," and take their lesson from other nations so far in advance of them, they might still form a great and influential people.

When I was at Madrid I heard a curious piece of scandal connected with our preparations for the Abyssinian war. I should have passed it over in silence as a "foreign canard," but I had it confirmed on my journey south. When the order was issued to purchase some thousands of

Spanish mules, two or three inexperienced officers were sent to make the purchases. These gentlemen were quite unacquainted with the language and the country, and it is a question if they knew an indifferent mule from a "high-caste donkey." At any rate they fell into the hands of some sharp Spaniards, or half-caste Gibraltar men, and a general raid was made on the mules. It was understood that "they were to be purchased at any price," and the Spaniards, always greedy, "improved the occasion." Every rip that could be found with a hide on its back was brought down to the coast at the average price of 120 dols., twice the value of a good mule. And when they came to be inspected it was found that scarcely half of them were fit for service. I witnessed the re-sale of some of these rejected animals which had been purchased at 130 dollars, and were sold for—how much do you think?—their full value, 20 dollars! Did any of our proceedings at the commencement of the Crimean war beat this? We may hear more of this when "the butcher's bill comes in," but in the satisfaction at the speedy and successful termination of the war, all blunders of administration will probably be condoned.

It was rather a trial for me on reading in the French and English papers that the winter had set in very severely, to pack and prepare to leave this mild and delightful climate, but there was no help for it, there were other duties and obligations before me. I could have run across the Gulf of Lyons, and been in Marseilles in sixteen or eighteen hours, and thence have hastened in a warm first-class carriage to Paris, without much trouble; but I wished to see the passes of the Pyrenees and the central line of France, and I have been gratified and amply rewarded for any little trouble or inconvenience I may have suffered.

There is a line of railway from Barcelona to Gerona, and diligences from thence cross the Pyrenees to Perpignon, where we join the French "Chemins de fer du Midi." I took my ticket out for the whole journey at the charge of 108 francs. We started at 6 A.M. The railway journey along this coast line, through hill and dale, afforded peeps at every opening over the clear blue sea, at vineyards, mansions, gardens of oranges and lemons, surrounded with cactus and aloe hedges; and there was more active life than we had been accustomed to see in the interior of Spain, which, with the most glorious weather, made the scene lively, and cheered us on our way. At Tordera we struck inland, when the country became less interesting. We got to Gerona at 10 A.M., and had a very comfortable breakfast. Three of us, a German scholar, a young Spanish-American, and myself, had engaged the coupé, and about 11 A.M. the diligence was yoked with six small high-boned horses, three abreast, in very tattered gear. Our conductor was a fair, red-bearded Frenchman, one of the best type of our lively neighbours, obliging and communicative, and was at once at home with us. We commenced the ascent of the mountains at Figueres. The day was still, clear, and delightful, with a light bright sky, and buoyant air. The scenery round this city may be compared to some of the passes into the Grampians: the stone pine and olive trees taking the place of our larch, and birch, and mountain ash. As we continue to ascend, the whole outline of the mountains appears rising ridge over ridge, with the distant snowy peaks skirting the horizon, and lights and shades of every tint. This range of mountain is not to be compared with the wild and lofty grandeur of the Alps, but is far more pleasing and beautiful to the eye, and easier for the mind to grasp. I referred in a former letter to the barren and uninterest-

ing passes on the west, by the way of Irun and St. Sebastian, and my disappointment at the scenery. This passage far exceeded my expectations in picturesque beauty and variety: now winding round the face of a mountain, clothed with every variety of green; and now descending into a fertile valley, or passing a mountain stream foaming over its rough bed and jagged walls, or meandering through vineyards and orange groves—a constant change of the most beautiful and picturesque scenery. At dusk we reached Junquera, the last Spanish town, and the highest point of our journey, and in a short time after arrived at Boulon, the French frontier town, where our luggage was examined, and our passports called for. This was the first time on this journey that my passport had been asked for. I had fortunately put an old one in my bag, but before showing it I had a little chaff with the gentleman in plain clothes, and a bit of ribbon in his button-hole. I told him I was not prepared to be called upon for a passport, that I had traversed France for some years without one, and would like to know on what authority he made so unusual a demand on a British subject? "First by this authority," opening his coat and showing me the ribbon of the Legion of Honour; "and next, we have instructions to examine all persons coming from Spain, on account of the troubled state of Italy." What the troubled state of Italy had to do with the Pyrenees frontier was not for me to question, and I rolled out the royal arms of England on a scroll, with the "bold Roman hand" of my Lord Malmesbury, 1858, the sight of which elicited a low bow and gracious thanks. My companions, not being British subjects, were prepared with their passports *en regle*.

Our driver and conductor seemed now to have snuffed their mountain air, "and their foot was on their native heath." A team of five splendid Normandy horses, in gaudy trapping—two in yoke and three leading—dashed along in the dim light up the sides of the mountains, down the steep precipice and over narrow bridges, the driver cracking his whip and jerking out the "She-e-e yo-o-o-o" of the good old times before the locomotive banished all the romance of travel. Out with the horses and in with a fresh team!—what a change from the slow action of the Spaniard—and on we go as before, till we reach Perpignon at 7 P.M., an hour and a-half before our time, which procured our lively conductor a willing *bono mano*. We agreed to remain here for the night, and had an excellent dinner and comfortable apartments at the principal hotel, and so pleasant and agreeable had the journey been, that we sat chatting over its incidents till it was nearly midnight, though we had to be up early next morning for the 5.30 A.M. train. We travelled together as far as Narbonne, where we parted, much to my regret. My travelling companions turned off for Marseilles, and I for Paris, by Toulouse and the mid line. Those acquainted with the eastern and western route through France, to Bordeaux or Marseilles, will form rather an unfavourable opinion of the scenery of that country. One must take this centre route to see all the most interesting and picturesque beauty of the country. The quaint old villages and towns rising on the hill sides, amidst extensive vineyards, are scarcely altered in appearance since the days of Sterne and his little hostelry, where even now, if two travellers were arriving together, they might have to make a compromise on the subject of accommodation. The journey from Toulouse, Agen, and thence to Perigueux, is one continued change of hill and dale and richly wooded undulations. This long journey involved a night in the train—and such a night, with eight to ten degs. of frost; with all the warm clothing

we could muster, it was a sore trial after the delights of the Mediterranean coast. We got to Paris at 5 A.M., twenty-four hours from Perpignon; started again by the mail train at 7 A.M., and were in London by 5.30 P.M., just fifty-eight hours from Barcelona, including the eight hours' rest at Perpignon.

THE BANK OF HEALTH.

WHOEVER takes a railway run from London to Matlock will travel during the last hour of his route through some of the most striking and fascinating scenery in England; and arriving at Matlock Bridge, will find himself at the foot of Matlock Bank, which for reasons that may presently appear we have designated the Bank of Health. The site has been well chosen for hydropathic purposes—the air and the water being both of remarkable purity, and the Bank, or steep hill side, being a capital centre or starting point, from whence may be visited all the picturesque wonders of Derbyshire. But we are not going to sing the praises of these agreeable resorts on the present occasion; we are going, for reasons with which we shall not trouble the reader, to try the experiment of the water cure, and see if any good will come of it. We are strangers to the place, and have no introduction; but fortunately that is of no consequence, the whole of the precipitous Bank, which runs up sharply to the height of some seven hundred feet, and, facing the south, stretches some two miles east and west, being a complete colony of hydropaths, whose hospitable doors stand open at all times ready to receive the stranger and wash his ailments out of him. Having no choice beyond a preference for high ground, we select one establishment standing near the summit of the hill, and thither accordingly we are driven along some winding roads of the most abominable description, which at length land us at our destination, just at the moment when the inmates, some three to four score in number, and of various social grades, are sitting down to dinner. We join the company as a matter of course, without the least inkling of ceremony, and the meal over, as we shall not be under regimen till to-morrow, have time to look about us.

Down in the valley beneath us runs the Derwent, sparkling and flashing in places, but not much seen, owing to the trees on its banks, and the intervention of the high grounds among which it winds. Below, a little to the left, is the village of Matlock, and beyond it, in the same direction, we catch sight of a portion of Matlock Bath, the rival of Buxton, and of the old city of Bladud, owing to the possession of certain hot mineral springs. Right opposite to us are the Heights of Abraham, said to be the highest of the Matlock hills, and to the left of them rises the huge mass of Riber, dominated by a heavy castellated building, as yet unfinished. To the right stretches the valley of the Derwent, and in this direction only is there any marked change in the colour or general green tone of the landscape, the distance westward allowing of the introduction of purple and grey. But before we have half examined the landscape we are captured by a press-gang, and find ourselves one of a party driving in an open carriage to Darley Dale, some three miles off, where there is a flower-show this afternoon, and prizes to be distributed to the winners of them by a noble lord. The show is in the grounds of Mr. Whitworth, of rifle reputation; and there we are confronted by some monster products in the way of garden vegetables, reared by cottagers, contrasted by a choice selection of hot-house fruit contributed by the gentry. About five o'clock the prizes are distri-

buted, being heralded by an appropriate speech from an old gentleman, *vice* the noble lord, who forgot to put in an appearance. They consist of very small sums of money, and of sundry articles of cottage furniture and kitchen wares, such as a rush-bottom chair, a couple of flat-irons, or a gridiron—but "*honi soit*," etc., the measure of a man's deserts is not the value of the prize he wins or loses.

We are back again to tea, and after tea we take a stroll among the winding roads, cross-roads, and foot-paths, which intersect the bank-side in every direction. One thing that strikes us is the abundance and clearness of the water: trickling down the hill in small rivulets, it is caught here and there in large cisterns of stone, which, although brimming over and shedding their contents on the road, seem to contain nothing, so absolutely colourless and transparent is the crystal fluid. The village, if Matlock Bank may be called a village, seems to have no centre, but to straggle in the most arbitrary way over the whole hill side—here a single cottage, here two; here a single row of houses, and here a double row—and here a pretentious hydropathic establishment, the property of some company of shareholders, and almost close to it what seems a private villa, but is really another hydropathic speculation, the property of a private individual. We tire of the steep roads and footways, and in search of more practicable ground, mount to the brow of the hill, where an unfrequented lane winds along for a mile or so, and comes to an end in a stubble field, where a few sheaves of wheat are yet standing. The sun is getting low, and the breeze blowing over the distant moors comes laden with the fragrance of the heath; at the same time it comes laden with something else, for dense showers of the honey-laden bees come swarming over the brow of the hill and plunging in mad haste down the steep towards their hives. So thick are the swarms, and so wild in their flight that they dash against one's head and face, and we have to take shelter under a wall until the mass of the multitude has passed on. The Matlock honey is most delicious, and the yield would appear to be abundant—a lump of comb nearly as big as a man's head being taken from the top of a single hive, which top had been fairly emptied twenty-one days before. Not a bee is ever sacrificed when the honey is taken, the hives being so constructed as to render that unnecessary.

We are early to bed and very soon to sleep, and are awoken before six in the morning by the persistent clamour of a bell, which calls us to commence our experience in hydropathy. We find the first essay more novel than gratifying, as we cannot at first relish the icy drenching which concludes the ceremony of the "tepid sheet"; but after it is over the effect is capital, manifesting itself in a feeling of freshness, and vigour, and a craving appetite. We find it impossible to wait an hour or two for breakfast, and, following the example of others, make for the kitchen, where cook compassionately helps us to hunches of bread and butter.

"Dun you like it well o' the butther?" she asks, and distributes her favours to suit our several likings.

There is time for a brisk walk before breakfast, and walking just now seems everyone's business—some promenading the saloon at the quick step, others marching up and down the platform outside, and others again starting off for their morning constitutional. Breakfast comes at eight, followed by the reading of a chapter, singing and prayer. Then comes the postman's interesting wallet and the general delivery of letters and newspapers; after which the company disperse, singly or in groups, in search of such enjoyment as may be

found. Walking seems the order of the day—the strong and convalescent undertaking long distances, and others suiting their excursions to their capacity. But we are warned by a notice on the wall of the saloon not to extend our excursions so far as to interfere with the course of bathing which all have to undergo. At eleven comes the second bath of the day, which may be a parboiling with steam or hot air at a temperature of 170° , a sitz, a mustard fubz, a pocking, a spinal rubbing, a shallow, a douche, or something or anything else, according to the nature of one's ailments, or the hydropath's view of one's case. At this second, or mid-day bath, it is that there is most activity and bustle, because there are no laggards indulging in "a little more sleep," and no very early birds eager to be finished off before the crowding begins; but all being present, or close at hand, all would like to be "put through" at once if that were possible. It is well on towards one before the entire ceremony is finished, and glad enough we are by this time to escape from the bath-house, where the stinging odour of the mustard, the escaping steam, the burning spirits, and the abounding hot and cold spray, make up a composite bath of themselves not over-gratifying to the sense. There is not much time for walking between the midday-bath and dinner, which is laid at two, and over at half-past, and but few care to walk after dinner. The two hours that follow before the afternoon bath are spent in lounging on the easy chairs and sofas, in reading or playing chess, or in answering letters, or perhaps in a quiet stroll about the grounds or the adjoining district. The bath-house has been well aired and ventilated before we enter it again for the concluding ceremony of the day, with regard to which we note that it is of a less heroic and more soothing character than the two previous ones. By the time we have gone through this triple wash, we are heartily sick of the routine of taking off one's clothes and putting them on again, and to say the truth, it is not until some days have elapsed that we are reconciled to the indispensable but tyrannous necessity.

With the afternoon bath the business of the day comes to an end, and its more agreeable recreations begin. About halfway down the hill, on an open plot of ground, is the fly-stand, where a number of open carriages, accommodating four or five persons, may be hired at any time. It is the custom to club together for the hire of these, and to be driven off in parties to some picturesque spot, there to picnic or wander about for an hour or two, and to return home about sun-down. This is by far the most pleasant of all the institutions of the water cure, and, if we are to judge by our own experience, it is the most invigorating and curative. There is abundant variety in the scenery of the neighbourhood, so that one is never tired of viewing it; and indeed, one never returns from one of these expeditions without the desire, at least, if not the intention, of repeating it. The most favoured of these short excursions are the run through Matlock Bath to the Black Rock, whence we have a view over the Matlock valley, looking down upon the High Tor, affording one of the grandest landscapes in England; and the somewhat toilsome and circuitous ascent to the Ribber, whence the view is of a totally different kind, but hardly less striking.

In wet weather—and wet weather at Matlock has a special signification—of course there are no excursions, and then the company are driven to their own resources. As no smoking is allowed, and such a thing as a bottle of wine must not even be mentioned, the attempt to inaugurate anything like conviviality on the usual plan cannot be made. There is a certain class of both sexes

that can tide over any emergency of this kind by going to sleep, and this class seems to gravitate, as if by some mysterious natural law, towards hydropathic establishments; at any rate, no sooner does the sky blacken and the rain begin to patter on the skylights, than down they go on the sofa slabs, the railway rugs, the shawls, the top-coats or dressing-gowns are drawn over them, some courteous passer-by volunteers to tuck them in, and off they go at the double-quick to the land of dreams, announcing their arrival in that blissful region by a flourish of trumpets more persistently sonorous than musically clear. Others, who have not this happy faculty, will betake themselves to the discussion of some theological topic, or some political question of the day, in which, if they are at all earnest, they are sure to be joined by more, until at length the friendly discussion grows into something very like a hostile dispute, voices wax high, the gentlemen use "words of heat," as parliamentarians say, and for a minute or two there is something like a row, which, in a minute or two more, has to subside under the ridicule which such an exhibition is sure to excite. When the wet weather is continuous, and the indispensable exercise cannot be taken out of doors—though a trifling shower is not regarded as any hindrance to walking—it has to be taken within, and the dining-saloon becomes the promenade ground, where we march up and down at a vigorous pace until we have had enough of it. Then the chess-boards and draught-boards are brought out, and friendly duels fought over the black and white squares; or perhaps one party will sit down to the game of "twenty questions;" or another will begin romping at "puss in the corner," or "catch who can." For those who prefer to be quiet there are retiring-rooms, whither they can retire to read or write, or enjoy a quiet tête-à-tête. Music is, of course, a favourite recreation when it is to be had, and if there be good voices or skilled performers available their services are gladly accepted; but to bang the piano into fits, or squall a ballad out of tune, is not voted music in mixed assemblies where the polite euphemisms of society are unappreciated, and the very wholesome result is, that at the water establishment we do not get dinned and deafened by too much of that queer product which passes for music in the family circle. After supper we manage to sing a hymn together as part of the family-worship, which winds up the proceedings of the day. Promenading after supper, in the starlight or moonlight, on the platform in front of the saloon, is a very general practice, but it cannot be kept up late, as we have all to be in bed by half-past ten, at which hour the gas is turned off and the lower region of the house left in darkness. The view from the platform on a starlight and moonless night is a singular one. Of the whole of the wide outspread landscape below, we see nothing but the black boundary line which cuts the clear azure above; but in a manner corresponding to the thousand stars glimmering in the upper concave of blue, are almost as many small, red lights gleaming in the lower concave of black. The native of the Bank can read off these nether constellations with ease; to his eye they map out the valley below just as the stars map out the heavens to the eye of the astronomer.

One of the surprises of hydropathic treatment is the course of diet. The following is something like the average routine:—Breakfast begins with a pretty solid mess of oatmeal porridge, and ends with tea or cocoa, and bread and butter, *ad libitum*. If the tea and cocoa are so much alike that one is not to be distinguished from the other, that may be due to the drinker's want of discrimination, and a little inquiry will remove the

doubt. Instead of butter, you can, if you like, season the bread with molasses, or preserved fruits, and you may imbibe any quantity of milk you choose. Dinner consists of mutton, almost invariably roasted, and limited, by recommendation at least, if not by rule, to one serving of about six ounces—of potatoes, with occasionally some green vegetable—and of puddings of a light and digestible kind, made of bread, rice, tapioca, sago, &c. Tea is the same as the breakfast, minus the porridge, but in fine weather this meal is only partaken by a part of the inmates, the majority being at this hour enjoying their distant excursions. Supper is a mere *nominis umbra*, being represented by some small sections of bread and a few cans of milk placed on a table at which no one sits down, but where whoever chooses may help himself. The chief variation in the above simple dietary takes place on the Sunday, when the dinner is a little more generous, and the tea really is distinguishable from the cocoa.

There being no baths administered on the Sunday, we feel it to be a special holiday, and enjoy it accordingly. The peal of the church bell comes sounding along the valley about ten, and we file off in different directions to our several places of worship. All denominations are represented in the Bank, from Episcopalians down (or up, which you will) to Primitive Methodists. If you are an invalid or only half convalescent, you can attend service in the crypt or underground chapel of the chief hydropather's establishment, where you will sit, not on a hard bench made of a nine-inch plank, as in a London chapel, but in a luxurious settee of ample cushioned area, affording ease and repose to every limb.

The dinner table on Sunday is usually the most frequented of the week, and offers a good opportunity of reckoning up the inmates. Our family circle numbers in all between sixty and seventy, about two-thirds being males, and includes all ages, from twenty to threescore and ten. Though they are all here avowedly in search of health, they may yet be divided into three classes—those who have nothing the matter with them; those who are but slightly indisposed either from overwork or free or careless living; and those more or less sadly afflicted with serious and chronic complaints. The first class is made up chiefly of young or more mature men in the middle rank of life, who are out for their annual summer holiday, and who make the bath-house their hotel and temporary home. Many of them are teetotallers by profession, so that the dietary, simple as it is, is just that which they prefer, and they amuse themselves with the baths as much as they like, and no more. The second class are those who really reap a substantial benefit from the institution; they come here prostrated in strength by hard work—or congested and feeble from free living—or nervously depressed through the intricacies of business—or dizzy and giddy through prolonged business excitement; and because they come here in time before any fatal mischief has been done, we see them growing better day by day, and almost hour by hour. It may be that what the system of treatment does for them it does in a negative rather than a positive way—that it acts beneficially rather in removing the causes of disease than in supplying real remedies; but the man who is restored to health does not care a straw about that—the health he had lost is restored, or at least it is so far restored as to invigorate him again for work, and he goes back to his business after a few weeks' experience at the water-cure, endowed with new energies and capacities. Next year he will probably return to the Bank to be recruited once more, and will repeat his visits from year to year, as many

are in the habit of doing, to their manifest advantage. Of the third class one cannot speak so hopefully: many of them are the victims of confirmed disease for which medical aid has been already tried in vain, and which the use of the baths will avail at best to mitigate in a greater or less degree; some have the incurable disorder of old age; some are tortured with rheumatism; some have been stricken with paralysis; and some are manifestly wasting away in decline. One thing is noticeable with regard to all the inmates, and that is that whatever their ailments, whether trifling or serious, they manage to put on a cheerful countenance before company, each one setting an example as it were to the rest in bearing complacently what has to be borne. It is impossible not to be struck at times with the sound pluck and heroism of men, and women too, who, while suffering sadly, will force a good-natured laugh in place of a groan, or translate the complaint that rises naturally to their lips into the language of a joke. Even those who are inwardly sustained by the highest source of strength, by this cheerful outward bearing help one another to put the best possible face on their common affliction.

The result of my short experience at the Bank of Health may be summed up briefly as follows: We who lead a town life, or a business life anywhere, lead an artificial life—we neither eat, drink, breathe, nor sleep in a regular and natural way, and we get out of order through violating the laws of nature. Now the hydropathic doctor will not allow us to commit such violation; he takes the means of self-indulgence from us, compels us to eat simple food, to drink water, to breathe pure air, and to retire early to rest; and to all these restoratives he superadds the invigorating processes of the baths: in other words, he puts his patients back into a natural way of living, and assists nature by the application of her own best remedy. As a curative agent hydropathy need not be expected to work miracles. When disease has not got the upper hand it may, and often does, by strengthening the general health of the patient, enable him to fight with it successfully, and in the end to shake it off. But in order to reap this benefit the patient should resort to it in good time—should, in short, consider it as a first—not a last resource, as too many seem to do.

LIFE IN JAPAN.

VI.

BOOKS, WRITING, ETC.

JAPANESE books are printed from wooden blocks, metal type being unknown, on thin paper, one side of the sheet only being used. The leaf is doubled and the edges uncut; and the letters are arranged in vertical columns, beginning like Hebrew at the right-hand side of the page, and, as we should call it, at the end of the book. The covers are generally very plain, made of dark coloured paper, somewhat thicker than the interior sheets; and the gilding which is put on the outside on the edges of our books, generally adorns the inside of the cover, and what may be termed the fly-leaves, in irregular patches. The origin of the art of printing is lost in the obscurity of distant ages: it has been handed down from one generation to another without any trustworthy record of its discoverer being preserved.

Cheap common books are often badly printed, the characters being indistinct and blurred, a defect frequently arising unless special care is taken when printing from wooden blocks. Mind your stops, an injunction so often enforced on English juveniles, can-

not be needed in Japan where punctuation is but rarely used. A simple alphabet is also wanting, various systems being in use according to the style of literature. For instance, ordinary works, romances, histories, etc., are written in characters of a comparatively easy nature, representing syllables. Songs and popular poems have these easy syllabic characters mingled with others of a more complex kind. Works of science, religious treatises, some dictionaries and prefaces are written in ideographic characters, *i.e.* characters representing ideas not sounds, derived from the Chinese alphabet; and in many cases, these are easily read and understood by educated Chinamen. In others only the roots of the words are given in ideographic signs, the Japanese inflections being written in the syllabic character and the Japanese arrangement of words followed, which renders such sentences almost unintelligible to one who has studied Chinese only. When the pure Chinese character or a modification of it is made use of, this has often a running commentary at the side in Japanese cursive writing as an explanation of the text. There is also a system made use of only by the priests called *Bou-zi*. Inscriptions on tombs and altars are engraved in these characters. Signatures and seal inscriptions are frequently written in a peculiar style of Chinese writing. All these diversities of method create great difficulty and confusion, and render the printed literature very puzzling to a learner, whether native or foreign. They result chiefly from the adoption of a foreign system adapted to a language that admits of few changes or inflections, and the incorporation of it with one which possesses many grammatical variations.

The Japanese dictionaries contain more than 38,000 characters, each of which has a name derived from the corrupted pronunciation of the original Chinese; this is of one syllable, in accordance with the spirit of the Chinese language, and to this is added several words of Japanese origin which translate it into the vernacular.

Pictures cut in wood have been also used to illustrate the text for many centuries; and printing in colours, an art of late development in Europe, has been practised in Japan during many ages. Specimens of printing in colours have been brought to England. The colours are brilliant without being gaudy, the drawing is somewhat rude and conventional, and the perspective imperfect; but there is a certain life and animation in the figures and scenes which redeems them from being mere caricatures.

Periodicals are issued at certain intervals giving tales and narratives in parts. As yet this system has not been extended to works of instruction or to newspapers.* The power of the press is entirely undeveloped, public opinion being formed only by the interchange of ideas at the baths and other places frequented by the common people. Books and pictures are inexpensive, and booksellers' shops numerous: they appear to have plenty of customers.

Of late the habits and manners of foreigners have afforded a fertile topic for the native artist and author. Pictures of ladies in bright coloured dresses, with largely developed crinolines, carrying parasols, may be seen in

the shop windows; and naval captains in bright blue uniforms and gilt buttons are favourite subjects for representation. Sewing machines and pianos, christening, wedding, and dinner parties, children playing at tip-cat and hoop, and everything European at all strange or new, are seized upon and depicted with sufficient accuracy to render them recognisable.

Japanese writing is very free and flowing, and well deserves the term "cursive," which is usually applied to it. Like printing, it is in vertical columns, commencing at the right-hand side of the page. Although this method of writing does not appear to admit of so much variety in the shape of the letters as the horizontal system, it is very rapidly done, and looks very characteristic. It is difficult for a student to decipher, as a very curious style is adopted, and the variations of handwriting always cause written characters to be less easily intelligible than printed matter. Pens and ink are of course not used: a brush consisting of a nicely arranged bunch of hair, finely pointed, in a bamboo handle, is passed along a stone, on which some Indian ink has been rubbed down with water. The writing paper is porous, and easily receives and retains the characters lightly and rapidly painted on it by the writer.

That which renders it difficult to speak and write Japanese correctly is, that the phraseology varies according to the position in life and relationship of the person addressed. A Japanese lady, when conversing with her female relatives, uses a different choice of words from what she would do were she speaking either to her male relatives or to her servants. To fail or to misplace these expressions betrays a want of refinement and education which is instantly discoverable by the practised ear; and thus one may be well acquainted with the colloquial language of the common people, and yet be unable to address those of higher rank.

In reference to writing, it may be mentioned that post-offices exist in all Japanese towns and cities, except "Jeddo," the capital of the Tycoon. The postage of a letter from "Simonosaki" to Jeddo (for letters are received there, though there is no public office whence they can be despatched) is five *tempos* (about sevenpence-halfpenny). The distance is over 200 miles, therefore the tariff is not much higher than what our fathers used to pay. In a country where money is worth so much as it is in Japan, it is sufficiently high to prevent a very large correspondence being carried on, but this means of communication is always available.

MUSIC.

It is strange that the sense of colour or the harmony of sight should be strong in nations where the harmony of sound is defective, if not entirely absent. A horizontal thirteen-stringed harp is the instrument most played upon by the Japanese ladies, but the sounds produced from it are lacking in sweetness and fulness. The strings are caused to vibrate by being struck with a piece of ivory or horn about four or five inches long, the handle of which is shaped like the handle of a table knife, while the part which comes in contact with the strings is widened out and thinned. The strings are stretched on a frame of lacquer work, which is often highly decorated and inlaid with mother-of-pearl. A kind of guitar somewhat similar to the banjo is also considered as a musical instrument, though it produces but a few tinkling sounds.

The drum and fife are represented by small *tomtoms* and flutes, the latter played always in a melancholy minor key like that to which the voices are attuned.

The Japanese do not understand the modulations of

* An attempt has been made to supply this want as far as European news is concerned, by the issue of a periodical called the "Flying Dragon," edited by James Summers, Esq., Professor of Chinese at King's College, containing a summary of news and information in Chinese characters, illustrated by woodcuts. It circulates at the various ports both of China and Japan, and may be regarded as an important step towards a mutual understanding between Europe and these distant communities. It is also a useful medium for advertisements, of which many manufacturers avail themselves, and thus serves to introduce European productions to the notice of these large populations.

the voice requisite for the production of the sweet harmonious sounds of which the human throat is capable. Singing with them is merely sustaining a series of monotonous high-toned falsetto notes resembling the sad howling of the wind on a stormy night, or the wail of a banshee, rather than the rich flow of song to which our western training has accustomed us. This melancholy music is, however, introduced on all festive occasions, and itinerant musicians are constantly met with in the streets. Every group of jugglers or actors has one or two male or female performers on the guitar and flute accompanying it, and at the picnics in the temple and tea gardens musicians are constantly to be found who entertain the pleasure-seekers with their dismal strains.

At some of the feasts in the spring, evening water parties are made up, that row about on the smooth land-locked bays in large boats ornamented with coloured lanterns. There is generally a musician on board, and at a distance the melancholy sounds wafted over the calm surface possess a wild melody, in keeping with the lofty hills and the deep unruffled waters.

The Bikuni, daughters of one of the sectarian priest-hoods, wander over the country begging alms, and carrying in their hands various kinds of musical instruments, such as the guitar before alluded to, or a small flute, with which they attract attention to their wants.

In wedding processions, when the bride goes to her husband's home, musicians herald her progress with loud-sounding horns and drums and a kind of shrill clarionet. In China also we find this custom prevalent, of singers and musicians performing upon miserable flutes and tinkling guitars, proceeding at the head of all bridal processions, as well as others of an entirely religious nature. A system of musical notation exists, but it is not elaborated; in fact, music, as a science, is unknown in these vast countries. It is curious to find nations, highly civilised in many respects, possessing the same organisation as that of their more musical fellow-creatures, yet with all these faculties of harmony undeveloped, not from want of power—for the Chinese at our missionary schools can be taught to sing quite melodiously, and the Jesuits instruct their neophytes to intone the various chants of the Romanist service with singular sweetness—but simply from want of skill. And so with the Japanese: there is no physical incapacity to prevent them producing good music, but a want of knowledge of the art. We have before alluded to the absence of singing birds in the Japanese islands, and it is a singular coincidence, that the inhabitants of these countries, where the sweet song of the lark and the rich notes of the nightingale, the blackbird, and the thrush are unknown, should in their music imitate the harsh melancholy cry of the gull and the hawk, instead of developing the numberless sweet sounds, the most varied and melodious of all of which the human voice is capable. Such music as is known is imparted to Japanese ladies and forms part of their education, and to women of the lower classes it also furnishes a means of employment. ●

DR. LIVINGSTONE.

THE tidings of the safety of Dr. Livingstone, after his long disappearance in the interior of Africa, spread a thrill of thankful gladness through all civilized lands. None of the detailed accounts since made known approach in interest the first letters which reached England. They were addressed to his trusty friend Sir Roderick Murchison, who persevered in his confident expectation of the traveller's return, even after the event had been given up as hopeless by almost all "African authorities."

The first letters read before the Royal Geographical Society are worthy of being recorded:—

"Bemba, Feb. 2, 1867.

"My dear Sir Roderick,—This is the first opportunity I have had of sending a letter to the coast, and it is by a party of black Arab slave-traders from Bagamoyo, near Zanzibar. They had penetrated here for the first time, and came by a shorter way than we did. In my despatch to Lord Clarendon I gave but a meagre geographical report because the traders would not stay more than half a day; but having written that through the night, I persuaded them to give me an hour or two this morning, and if yours is fuller than his lordship's, you will know how to manage. I mentioned to him that I could not go round the northern end of Lake Nyassa, because the Johanna men would have fled at first sight of danger; and they did actually flee, on the mere report of the acts of the terrible Mazitu, at its southern extremity. Had I got them fairly beyond the lake they would have stuck to me; but so long as we had Arab slave parties passing us they were not to be depended on, and they were such inveterate thieves it was quite a relief to get rid of them, though my following was reduced thereby to nine African boys, freed ones, from a school at Nassick, Bombay. I intended to cross at the middle of the lake, but all the Arabs (at the crossing station) fled as soon as they heard that the English were coming, and the owners of two dhowes now on the lake kept them out of sight lest I should burn them as slavers. I remained at the town of Mataka, which is on the watershed between the seacoast and the lake, and about fifty miles from the latter. There are at least a thousand houses in the town, and Mataka is the most powerful chief in the country. I was in his district, which extends to the lake, from the middle of July to the end of September. He was anxious that some of the liberated boys should remain with him, and I tried my best to induce them, but in vain. He wished to be shown how to make use of his cattle in agriculture; I promised to try and get some other boys acquainted with Indian agriculture for him. That is the best point I have seen for an influential station, and Mataka showed some sense of right when his people going without his knowledge to plunder at a part of the lake, he ordered the captives and cattle to be sent back. This was his own spontaneous act, and it took place before our arrival; but I accidentally saw the strangers. They consisted of fifty-four women and children, about a dozen boys, and thirty head of cattle and calves. I gave him a trinket in memory of his good conduct, at which he was delighted, for it had not been without opposition that he carried out his orders, and he showed the token of my approbation in triumph.

"Leaving the shores of the lake we endeavoured to ascend Kirk's Range; but the people below were afraid of those above, and it was only after an old friend, Katosa or Kiemasura, had turned out with his wives to carry our extra loads that we got up. It is only the edge of a plateau peopled by various tribes of Manganja, who had never been engaged in slaving; in fact, they had driven away a lot of Arab slave traders a short time before. We used to think them all Maravi, but Katosa is the only Maravi chief we know. The Kanthunda, or climbers, live on the mountains that rise out of the plateau. The Chipeta live more on the plains there. The Echewa still farther north. We went west among a very hospitable people till we thought we were past the longitude of the Mazitu; we then turned north, and all but walked into the hands of a marauding party of that people. After a rather zig-zag course we took up the point we had left in 1863, or say 20' west of Chimanga's, crossed the Loangwa in 12° 45' south, as it flows in the bed of an ancient lake, and, after emerging out of this great hollow we ascended the plateau of Lobisa at the southern limit of 11° south. The hills on one part of it rise up to 6,600 feet above the sea. . . . I have done all the hunting myself, have enjoyed good health, and no touch of fever; but we lost all our medicine, the sorest loss of goods I ever sustained, so I am hoping, if fever comes on, to fend it off by native remedies, and trust in the watchful care of a higher Power.

"I have had no news whatever from the coast since we left it, but hope for letters and our second stock of goods (a small one) at Ujiji. I have been unable to send anything either; some letters I had written in hopes of meeting an Arab slave-trader, but they all 'skedaddled' as soon as they heard that the English were coming. I could not get any information as to the route followed by the Portuguese in going to Cazembe till we were on the Babisa plateau. It was then pointed out that they had gone to the westward of that which from the Loangwa Valley seems a range of mountains. The makers

of maps have placed it (the Portuguese route) much too far east. The repetition of names of rivers, which is common in this country, probably misled them. There are four Loangwas flowing into Lake Nyassa."

The following letter from Dr. Kirk, dated Zanzibar, the 1st of March, was also read:—

"I am glad to announce that a letter has just been received from Miramuezi confirming the news brought three weeks ago. Livingstone has been in Ujiji in the middle of October last, where he would meet the agent in charge of stores and letters sent to him from Zanzibar. This letter reached us in fifty days. It was bought by slaves in advance. The Arabs of the caravan will be here in fifteen or twenty days hence; probably they will be bearers of Dr. Livingstone's letters from Ujiji. He has, no doubt, long ago gone forward to Albert Nyanza. I sent him Sir Samuel Baker's map, together with an account of all I know of the geographical problems involved, for it must be remembered that when Dr. Livingstone left England Sir Samuel Baker's discoveries had not yet been made known. With this map in his hand he will be able to apply himself to ascertaining the missing links in the chain of lakes. The Sultan of Johanna has been addressed on the subject of Mooss and his companions, and I trust he will take measures to have them punished, not simply for having fled, but for having given a false tale in their defence, and thus caused so much grief as well as no little expense."

First and last, in all his travels, the suppression of the slave trade and the permanent amelioration of the poor African races, have been the ruling motives of the good missionary traveller. In the recent volume of another missionary of African fame, the Rev William Ellis, "Madagascar Revisited," there is an interesting letter from Dr. Livingstone, written while Mr. Ellis was at the Court of King Radama II. Dr. Livingstone says—

Apart from all consideration of justice and mercy, it is impolitic to allow a traffic which tends to render labour unpopular. The Malagasee will rise in the scale of nations only by hard work. You may tell the king, if you think proper, that while labouring to put a stop to this horrid traffic by pacific means, it will be a joy to my heart in Africa if he will co-operate in the same noble work in Madagascar. I got out a steamer at the beginning of this year for Lake Zanzibar alone. She is in pieces, and when we get up to the cataracts of the Shire we shall unscrew her, and carry her past; but we had to put her together first in the low Zambesi delta, and had great sickness in consequence. My dear wife, who I never intended for that exposure, was the only victim of the fever, and I now feel lonelier in the world than before. Much reduced by sickness; and having a Johanna crew who wished to return home, we came away in the Pioneer."

On this letter Mr. Ellis remarks—

"The king was interested, and deeply affected by Dr. Livingstone's statement of the frightful number of slaves exported *vid* Zanzibar. In reference to Madagascar, he said it was contrary to his wishes and orders that any should be imported to the country, and he did not think there could be many brought in. He had sent orders to the authorities to prevent slaves from another country being landed, or sold. To myself Dr. Livingstone's letter was welcome and refreshing. It was just the kind of letter which one Christian labourer might be expected to write to another so circumstanced. I had been near him abroad, some years before in Mauritius: we had been long acquainted, and I had last met him in London, and when I found that he had sailed along the west coast of Madagascar, it did not seem to me that we were so far apart as before. I had always honoured his noble self-devotion, and steadfastness of purpose in pursuit of the great objects at which he aimed. I had always believed that the end of the geographical was to be, in his aim, the beginning of the missionary enterprise, and that in whatever direction his steps might tend, he would carry with him a true missionary heart. I believed also that he was, to his own apprehension, furthering the great missionary work by opening up new fields to Christian effort, and by endeavouring to substitute, for the misery, and the murderous barbarism of the slave trade, honourable and lawful commerce as a means of preparing the way for the entrance of the Gospel of freedom and of peace. I have sympathised deeply with him in the heroic patience he manifested under the suffering and disappointment recorded in his last volume, and most earnestly desire for him an easier path, and happier results, in the arduous enterprise in which he is now engaged."

Varieties.

POLICE IN TOWNS.—The last annual return of the numbers of the police shows that in 1866 the police in the city of London, officers and men, were 699, being one to every 147 of resident population. In the metropolitan police district the number was 6,839, being one to every 500 of resident population, not reckoning the 739 dockyard police. The cost of the city police for the year was £60,123, and of the metropolitan police, £574,457. In Liverpool the police force was 1,100 in number, or one to every 440 inhabitants; the cost for the year was £76,844. In Manchester the number was 674, or one to 532 inhabitants, and the cost, £41,936; in Salford, 112, or one to 1,008 inhabitants, and the cost, £7,820. In Birmingham the force was 377 strong, or one to 891; and the cost, £26,119. In Leeds, 270, or one to 845; the cost, £17,675. In Sheffield, 245, or one to 891; the cost, £14,875. In Bristol, 303, or one to 540; the cost, £19,854. In Newcastle, 154, or one to 794; the cost, £12,362. In Hull, 152, or one to 692; the cost, £10,546. In many of the smaller towns, which maintain a separate force, the police are not one to 1,000 of population, and the total number is, therefore, inconsiderable. Some of the small boroughs present in the return almost the caricature of a force; Bodmin is returned as having a police force of three for its 4,500 inhabitants; Berwick five for its 13,000. The average for all England, town and country, is one to 894 of the estimated population. In these calculations the number of the police "establishment" is taken, and not the actual number on any particular day; and therefore where there were any vacancies the force is to that extent over-estimated. By the number of inhabitants is meant the number of persons sleeping in the town; persons resident during the business hours of the day, but sleeping out of the town, are not counted. In the city of London the resident population in the day is more than double that of the night; and the police force is only one to every 406 of the resident population in the daytime.

LOUIS PHILIPPE.—"He was a prince and a Bourbon; he was born and educated in the bosom of the old French monarchy, at the court of its kings; he was not a stranger to the maxims and traditions of the monarchies of Henry IV and of Louis XIV; he knew and comprehended them, not as a history we study, but as we know and comprehend facts we have witnessed. Very enlightened as to the vices and weaknesses of the old system, he was also well aware of the principles of government which long duration had introduced into it, and he judged it without animosity as without ignorance. Associated, on the other hand, from his youth with the ideas and events of the Revolution, he was sincerely attached to its cause, but also strongly impressed with its wanderings, faults, griefs, and reverses, and greatly mistrustful of the revolutionary passions and practices which he had seen in full play. All these spectacles, all these reminiscences, so many impressions and observations so variously heaped together in the short space of his life, had left him sadly perplexed as to the issue of such a great social crisis and the success of his personal efforts to put an end to it. He believed at the same time in the necessity of free government and in the difficulty of its establishment. We were talking one day alone in a small drawing-room at Neuilly; the king was in one of his moments of doubt and discouragement—I in my usual habit of optimism and hope. We were arguing with animation. He took me by the hand. 'Listen, my dear minister,' said he; 'I wish with all my heart you may be right, but do not deceive yourself. A Liberal Government in face of absolute traditions and the spirit of revolution is very difficult; we want Liberal Conservatives, and we have not enough. You are the last of the Romans.'"—*Gruyot.*

VALUE OF REAL PROPERTY IN AMERICA.—The marvellous rise in real property in the metropolis of America is shown by the following from the "New York Times":—"The south corner of Broadway and Bond-street has been valued within a lifetime at ten dollars; it was sold once for 250 dollars, then offered for 500 dollars, then for 2800 dollars, and in 1839 was again sold for 18,000 dollars. Recently an enterprising Sewing Machine Company offered 200,000 dollars for it, which being declined they have leased the premises for a long term, and are about to open the most magnificent sewing-machine establishment in the world. During the past forty years the property has doubled in value every seven years. The whole of New York Island was once sold for ten dollars."

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

PORT LOUIS, ISLE OF FRANCE.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER V.

O'CARROLL's alarm increased as he saw the privateer approaching. "We shall all have our throats cut to a certainty," he cried out. "They will not leave one of us alive to go home to our disconsolate widows to tell them all that has happened. I know them too well, the villains. Arrah! it was an unfortunate moment that ever I was brought to tumble twice into the hands of such gentry."

"We are not in their hands yet, and if we make a

good fight of it, may be we never shall," exclaimed Captain Hassall. "My lads, if you'll stand by me, I'll hold out as long as the craft can float. We beat off this same fellow once before, let's try if we can't beat him off again."

This brief address inspirited our crew, and almost worn out with fatigue as they were, they promised to defend themselves to the last. My sensations, as we saw the enemy approach, were not altogether pleasant. We might beat him off in the end; but even that, in our present condition, was not likely; and how many of our number might not be struck down in the struggle! In

the meantime, the men armed themselves with pistols and cutlasses, powder and shot was got up, and every preparation made for the fight. The enemy approached, but as he had run to leeward, it was some time before he could work up to pass us to windward. We had carried a stay from the mainmast to the bowsprit, and on this we managed to set a sail, so that the ship was tolerably under control. When the enemy, therefore, at last passed under our stern, we were able to luff up and avoid the raking fire he poured in. No damage was done to any of our people, but a shot struck the mainmast, and wounded it so badly that it was evident that, with any additional strain, it would be carried away altogether. Putting up the helm we again run off before the wind. The enemy was soon after us, but though he came up abeam in the heavy sea still running, his aim was of necessity uncertain, and for some time not a shot struck us, while several of ours struck him. This encouraged our men, who gave vent to their satisfaction whenever he was hulled, or a shot went through his sails. Our hopes of success were, however, soon brought to an end, for, as we were compelled to luff up suddenly, to avoid being raked, as he was about to cross our bows, the heavy strain on our wounded mast carried it away, and with it the mizen topmast, and there we lay a helpless wreck in the trough of the sea, at the mercy of the enemy. Still, as we could work our guns we would not give in, but hoisting our flag on the mizenmast we continued firing as long as we could bring our guns to bear. A loud cheer burst from the throats of our crew; the Frenchman was standing away. This exultation was rather too precipitate. As soon as he got out of range of our guns, he hove to and began firing away from a long gun, the shot from which occasionally hit us. One poor fellow was killed, and two wounded. It was clear that the privateer was merely waiting till the sea should go down, when he would run alongside and capture us without difficulty.

Captain Hassall at last, seeing what must inevitably occur, called the officers round him, and proposed surrendering. "The villains will cut all our throats if we do, that's all," observed O'Carroll. "I would rather hold out to the last and sell our lives dearly." Most of us were of O'Carroll's opinion.

"Very well, gentlemen, so let it be," said the captain. "I have done my duty in offering to surrender, when I consider that successful resistance is hopeless; still I agree with you that it would be better to die fighting than to be murdered in cold blood."

When our guns became useless, the crew had been set to work to clear the wreck of the mainmast, and to prepare sheers for a jury foremast. "And this is to be the termination of our enterprise," I thought. I must own I gave way to some bitter reflection. While all hands were busily employed, I turned my eyes westward, and there, in the very place where the *Mignonne* had appeared, I saw another white sail. I pointed her out to the captain. "She may be a friend, and turn the tables," he observed. "If a foe we shall not be worse off than at present."

It soon became known that a sail was in sight. The crew came to the conclusion that she was a friend. The Frenchmen at last saw her. Whatever opinion they formed, they judged that it would be wise to finish the fight and take possession of us. Once more the enemy drew near. The firing became hotter than ever. I turned many an anxious glance at the approaching sail. I felt sure that in spite of the staunchness of our men we must inevitably be overpowered. The stranger was getting closer and closer.

"She is a frigate," cried the captain. "She shows English colours! hurrah! hurrah!" The enemy saw that the chance of capturing us was gone. Sweeping round us with diabolical malice he gave a parting broadside, which killed one man and wounded another, and then under all the sail he could set ran off before the wind. The frigate had now also made more sail and closed as rapidly. She came close to us. "Are you in a sinking state?" asked a voice from the frigate. "I hope not," answered Captain Hassall. "Then hold on and we'll come back to you," said the voice which we took to be that of the captain. As I was watching the frigate through my glass, as she rushed by us, who should I see standing in the main rigging but my own midshipman brother William! I waved heartily to him, but he did not make me out. From my usual sedate manners, my shipmates seeing my gestures thought that I had gone mad, and was waving to be taken on board the frigate. "She is the *Phœbe* frigate," I exclaimed, jumping out of the rigging on deck. "No fear that we shall be deserted now." I then explained how I came to know the name of the frigate. All hands were now set to work to get the ship to rights.

The chase, meantime, became very exciting. "The captain does not know what a fast pair of heels that privateering scoundrel possesses, or he would not have much hopes of catching him," observed Captain Hassall, as he watched the two vessels. The topsails of the Frenchman soon disappeared beneath the horizon, and the shades of evening at length closing down, we were left alone on the world of waters, into which the heavy swell made us roll our sides till we almost dipped our bulwarks under—each time showers of spray being sent dripping off them. The enemy had made several shot holes in our sides, and those were now, we found, taking in the water faster than was altogether agreeable. The carpenter and his mates had indeed hard work to stop them. I have heard of people's hair turning white in a single night. I felt as if mine would, for it became doubtful if after all the ship would swim, from the quantity of water she was taking in. We, indeed, had reason to regret that we had allowed the frigate to leave us. At last the morning broke. We eagerly looked round the horizon. No sail was in sight. Would the ship float another day? The shot holes had been stopped, but should bad weather again come on it would be impossible to say what would be the effect on the vessel. Noon came, but no sail was in sight. We were afraid that the cunning privateer had led the frigate a long chase, perhaps among shoals and reefs, and that she had got on shore, and that we might not see the foe again.

"More likely that she was only the Flying Dutchman, taking a longer cruise than usual," muttered Stubbs. "There's no saying what tricks that fellow is not up to."

"What, not got the Dutchman out of your head yet, Stubbs?" said Randolph, "Why Biddulph saw his brother on board, and two or three of our people know the *Phœbe*, and recognized her."

"Yes, I know that's what often happens. The Dutchman can make his ship look like any vessel he chooses," persisted Stubbs; "naturally—that is to say as she generally appears—she is a curious old-fashioned rigged craft—you may depend on that."

While we were speaking—taking a breath between our labours, for all hands had been working hard—"A sail, a sail!" was shouted by one of the seamen. We all looked in the direction in which he pointed, and there appeared the upper sails of a ship. Our

hopes made us believe that it was the frigate. "As likely the Frenchman come to finish us off, or may be only the Flying Dutchman again," said Stubbs. I thought that I detected a gleam of humour in his eye, as if he was not quite so credulous as he pretended to be. As the stranger approached, the belief that she was the Phoebe gained ground. At length those who knew her best said that there was no doubt about the matter. They were right. Before dark she hove to close to us, and a boat with a midshipman in her boarded us. The midshipman was my brother William. He almost tumbled back with surprise at seeing me, for he did not even know that I was coming out.

"Why, James, where have you sprung from?" he exclaimed. "I am thankful to see you unhurt, for we have been anxious about you all day. Couldn't tell how much damage the rascal might have done you. Well, he escaped after all. He has a fast pair of heels, indeed, and he led us a pretty chase, till he got in among some reefs, on which we were nearly leaving our bones. We saw our danger, however, and by the time we were clear he was out of sight."

The boat's crew were directed to remain on board to put the ship to right. When, however, Captain Young found that this would occupy some time, he offered to take us in tow. A hawser was accordingly passed on board, and away we went in the wake of the frigate. Our course was for the Isle of Bourbon, lately captured from the French. At the end of a week we anchored in the Bay of St. Paul in that island. On our way there we had done our best to get the ship in order. Our crew were now set to work in earnest, aided by some of the men of the Phoebe, who were kindly spared to us by her captain. I took the opportunity of seeing something of the island. My brother William and some of the other midshipmen of the Phoebe got leave to accompany me, and merry parties we had.

Bourbon is about one hundred and fifty miles in circumference, and rises rapidly from the sea, forming one huge blunt-topped mountain in the centre; indeed, the whole island is not unlike a big tea-cup in the middle of the ocean, with some rather large cracks, however, in it. It is generally fertile, coffee and cotton being grown on it. On the south side, a few miles from the sea, there is a volcano which grumbled and growled, but seldom did more than send forth a little smoke. The inhabitants did not appear to be at all soured at having been placed under British rule. Probably, indeed, it was a matter of indifference to them, for they have themselves sprung from a mixture of half the races under the sun. Many of the inhabitants are descended from some of those English pirates whose head quarters were, for nearly a hundred years, on the island of Madagascar, but who, about the middle of the seventeenth century, growing weary of their lawless calling, settled here. As their wives were mostly from Madagascar they are somewhat darkish, but not bad looking. They are a lively, merry race, fond of dancing, and their climate is delightful. The names of some of the families belonging to the island are derived from the English, as are those of several places. I remember a bay in Madagascar, Antongil Bay, which clearly takes its name from the well-known pirate leader, Antony Gill, who robbed and murdered on the high seas early in the seventeenth century.

A squadron and troops were collecting here, the latter under General Abercrombie, for an expedition to the Mauritius. We were greatly disappointed, I must own, that our ship was not in a condition to proceed to sea, or we should have been chartered to convey troops and

been witnesses of the triumphs we hoped they would achieve. My object is, however, to describe my own adventures in the pursuit of pacific commerce. I will thus only briefly say that the expedition arrived speedily off the Mauritius, the troops were landed, and that after some sharp fighting by which we lost 150 men killed and wounded, the French General, De Caen, capitulated. We had several sepoy regiments, and the French general, in order to inspire the colonial troops with contempt for them, publicly promised that whoever should capture a sepoy should have him for a slave, but the militia appear to have thought that by so doing they might possibly catch a Tartar, for not a sepoy was made prisoner.

I made some satisfactory sales at Bourbon, and as soon as the ship was repaired she followed the men-of-war to the Isle of France. The island is about 35 miles long and 115 in circumference, with a surface greatly diversified by hill and plain, wood and plantation, with several considerable mountains, the chief of which, Le Pouce and Pieter Botte, in the neighbourhood of Port Louis, are well known. The harbour was a complete forest of masts, filled with vessels of all sorts and sizes, from the huge line-of-battle ship to the humble canoe, not unlike a butcher's tray, scooped out of a single log. The British flag waved triumphantly on all the batteries; and Indianmen, transport prizes, merchant craft of all descriptions displayed English colours, in most cases flying over the French. Numerous boats, too, were plying to and fro filled with naval and military officers, captains of Indianmen, sailors, lascars, negroes, and Frenchmen, some on business, some on pleasure, but all seeming to be in a hurry. I looked out with no little curiosity for any craft which might answer the description of our late antagonist, the Mignonne. If she had entered the harbour, she had again escaped before the capture of the place, for she was nowhere to be seen. It would have been satisfactory to have seen our friend caged, but it was too probable that he was still roving over the ocean, on the watch to plunder any English craft he could venture to attack.

The scene on shore was even more animated than on the water. The streets were crowded with people of many nations: naval and military officers, English and French Government civilians, merchants and other traders, Asiatics and negroes, almost naked slaves dragging along horse-loads in carts, with mongrels of every shade of colour. The town, though in a bustle, was perfectly orderly; the shops were all open, and their owners seemed to be driving a thriving trade, as were also the keepers of taverns, which were full of visitors from fleet and camp. We fortunately had several articles among the cargo of the Barbara, of which our countrymen were much in want, not to be found in the stores of the place. They were, however, quickly disposed of, and I was then at leisure to amuse myself as I thought fit. I made several excursions on shore with my brother when he could get leave, and I had thus an opportunity of learning the productions of the island. The chief food of the lower orders and slaves are yams and the *jatropha*, or cassada, of which there are two species commonly known, the *jatropha janipha*, and the *jatropha manihot*. The former contains a strong vegetable poison, which is destroyed by boiling; the latter is merely slightly narcotic in its effects, and both are easily converted into wholesome food. The root, after being well washed and dried in the sun, is usually scraped into a coarse powder, from which the juice is expressed; it is then dried a second time and formed into thin cakes, very similar in appear-

ance to Scotch barley-cakes. The bread thus made is called manioc. Tapioca is also a preparation of the root. Plantains, bananas, melons, and mangoes abound, and the last are especially fine. The climate is healthy, but the Mauritius is occasionally visited by terrific hurricanes, which commit great damage both afloat and on shore.

We soon made friends among the French residents, and one of them with whom I had had some transactions, invited William and me, and a military acquaintance, Captain Mason, to his house in the country. We were most hospitably entertained by our worthy host. The house was large and airy, with a verandah running round it on one side sufficiently broad to enable us to sit out and enjoy the cool breeze, while we smoked our cigars and sipped our coffee. We had proposed returning that evening, but the wind got up, it rained heavily, and became very dark. Our host pressed us to stay, and as William's leave extended to the next morning we accepted his invitation, he undertaking to put my brother on board in time. Our companion, Captain Mason, was a quiet, amiable man. He was married, and as he expected to remain on the island, he had, he told us, sent for his wife from the Cape of Good Hope, where he had left her. I cannot now describe the incidents of our visit.

The next morning, soon after day-break, having taken an early breakfast of a lighter character than suited our English appetites, we drove back to Port Louis. The weather had grown worse instead of improving, and as we drew near the town, we saw in the distance two vessels with English colours approaching the harbour. William had to hurry on board his ship, but Mason and I drove on to a spot where we could see them enter. One gained an anchorage in safety, but the other still continued outside, steering wildly as if uncertain what course to take. It was soon evident that she was in great danger. While we were looking on, Captain Hassall joined us. There were a number of naval officers, masters of merchantmen, and others collected on the shore. "She is said to have a pilot on board, and an ignorant fellow he must be, or he would have anchored outside ere this if he could not get in," observed Captain Hassall. While he was speaking, the vessel got into the swell of the sea which was dashing on the rocks close at hand. Rapidly she came drifting towards them. Probably the master then asserted his authority, for two anchors were let go.

The fate of the ship, and probably of all on board, depended on the anchors holding. With deep anxiety we watched her as the huge swells came rolling in towards the rocks. A cry arose from the collected crowd. "The cables have parted—the cables have parted!" The hapless craft was lifted by the next surge, and hurried on amid the foaming breakers towards the rocks. At that instant the foresail was set in the hopes of its helping to force her over them. It was useless; down she came with a tremendous crash on the black rocks. For a few minutes she continued beating on them, rocking to and fro in the wildest agitation; then a huge surge, which appeared to have been for some time collecting its strength, struck her on the side, and rolled her over, as if she had been merely a child's plaything, towards the shore, to all appearance overwhelmed, so as never to rise again. The wild breakers dashed triumphantly over her, but she was not conquered, though it seemed a wonder that wood and iron should hold together under the tremendous shocks she was receiving. Once more she rose to an erect position, and it was seen that her daunt-

less crew were endeavouring to cut away her masts. "It is the only thing they can do to save their lives," observed Hassall, watching them through his glass. "And see,—yes—there is a woman on board—a lady by her dress. She is clinging to the windlass—probably secured to it." As he was speaking, the mizenmast came down, followed quickly by the mainmast, which happily fell towards the shore. Again a surge covered the vessel. We feared that all on board would be swept from the decks; but when again the surge receded, the people were seen clinging fast as before. A boat from one of the men of war now approached the wreck, but the officer in command soon saw that he should only throw away his own life and the lives of those with him, if he should attempt to go near enough to receive any one on board. The foremast now fell, and still the stout ship hung together. Other boats came up and got as near as it was possible to go. That those on board thought she would not do so much longer was evident by the efforts they began to make to escape.

First we observed a man descend the foremast as if with the intention of swimming ashore. His courage however forsook him, he paused and returned. Again he climbed along the mast, but hesitated—it was indeed a desperate undertaking. At length he cast himself into the water: immediately he was overwhelmed. Would he ever again reach the surface? "Yes! yes! there he is," cried out several. For a moment he was seen struggling bravely. A groan escaped from the spectators: "He's gone! he's gone!" "No, no, he is still floating," many shouted out. So he was; but whirled here and there, blinded and confused, he was unable to guide himself. He was seen, happily, from one of the boats: she dashed forward, and he was hauled on board without apparently having struck a rock. All this time the people on the wreck had been watching him with intense anxiety, especially the poor lady: "If a strong and bold swimmer could scarcely be saved, what chance had she?" Hassall made the remark. "Not one would have a prospect of being saved if trusting only to his own strength; but there is a Ruler above," said Captain Mason, who had hitherto been watching the wreck without speaking; "He may save that poor woman on the wreck as easily as the strongest seaman." I have often since thought of my friend's remark. It is not our own right arm, but God in heaven, without whose knowledge not a sparrow falls to the ground, who preserves us in many dangers. Captain Mason begged for the use of Hassall's glass and looked steadfastly through it at the wreck. "It is impossible, yet the figure is like—I cannot make it out," I heard him say. The success of the first man induced another to attempt reaching the shore. He hurried along to the end of the mast and threw himself into the water. The boiling surges whirled him round and round—now he was concealed by the foam—now he appeared struggling onward—still it seemed scarcely possible that he could escape from the boiling cauldron—just then a broken spar floated near him. Had the end struck him he must have been lost, but it came on so that he could clutch the middle. Tightly he grasped it till like his shipmate he was floated near one of the boats and taken on board. Two other men, encouraged by the success of the first, attempted to reach the boats by the same means, but, scarcely had they committed themselves to the water, than a huge roller came roaring on dashing over the ship, and as it receded swept them off far away to sea; for a moment their forms were seen struggling amidst the foam, and then they were hid for ever from human eye. The lives of the remainder on board seemed more than

ever in danger. Should the storm increase, of which there seemed every probability, the ship must go to pieces, even if they were not first washed off the deck, and then what effort could save them? I was more than ever interested in their fate, when suddenly the idea occurred to me that the lady on board might be the wife of my friend Mason. I thought that he had the same idea, though he would not allow himself to entertain it, by the agitation he exhibited, and which he in vain tried to control. As yet the men who had been saved had not been brought on shore. More boats were coming down the harbour. At length a fine whale-boat was brought down not far from where we were standing. A naval officer, whose name I regret that I did not note, volunteered to take the command, and to go alongside the wreck, if volunteers could be found to man her. Hassall at once offered his services, as did several other masters of merchantmen standing by, and they were accepted. Mason and I also volunteered. "Not unless you are seamen," was the answer. "This work requires firm nerves and skilful hands."

I must observe here that I have ever found the officers of the mercantile marine ready to go forth, in spite of all dangers, to save the lives of their fellow creatures. Though there are exceptions, the greater number are as gallant fellows as any of those who have fought the battles of our country.

The boat was manned and ready to go off, but it became a question whether it would be wise to wait on the prospect of the sea going down, or to risk all and to go off at once on the possibility of the gale increasing. The men who had been rescued were brought on shore. Mason hurried to them, and eagerly enquired who was the woman on board. They were common seamen and did not know her name. She was a lady, and had come on board at Cape Town just as the ship was sailing. That was all they knew. The naval officer had earnestly been watching the huge rollers as they came tumbling on towards the shore. Suddenly he cried out, "Now, gentlemen, we'll be off." Away went the boat amid the foaming seas towards the hapless wreck.

CAST-OFF SKINS.

BY THE AUTHOR OF "THE HARVEST OF A QUIET EYE."

EARLY in May the thought occurred to me, which is labelled by this somewhat strange title; strange it may seem at least to those of my readers who have failed to notice in themselves the phenomenon to which it alludes. And yet from vegetable, through insect, reptile, even up to the highest animal—the human—life, you shall find this episode of casting skins one of constant recurrence. It may interest some to have their attention drawn to a state of things so remarkable. For very many people do not observe, do not mark and study life. It is a book of deepest and most abstruse philosophy, over which they are content to skim; perhaps indeed idly or busily to turn page after page, reading with thought only of each block of words, but, with little or none of the purpose, the sustained plan, the systematic whole which underlies them. So they fall asleep when the last page is reached without ever having mastered, or tried to master, the plan of the book. They have but a confused, dim, often utterly erroneous idea of its intention and meaning; they have been occupied merely with the parts; they never set themselves to consider it as a whole. Some pages were interesting, some feverishly exciting; some were dull; a

good many were sad; but they read on superficially, never finding out, perhaps never inquiring for, the plot of the poem, the scheme of the treatise. And so when they come to the end of life, the fact is, in short, that they know nothing about it. Hence it comes that they call themselves shrewd, and prosperous, and far-seeing, and happy, and in need of nothing; and know not that in fact they are wretched, and miserable, and poor, and blind, and naked; and this just because they do not understand life, nor its plan, nor its purpose, nor its grand object. I have a small dog, very eager after stones. Not seldom, if I have unbent so far as to throw one for him down a grassy slope, he waits not to see it leave my hand, but turns off in quite another direction from that in which the stone is flying. He runs hard:—but there is nothing to show for the running at the end. This seems to me a quaint parallel with the life of many an energetic worker. There is a hasty setting out to run the race, with no thought to seek the Master's guiding as to the really profitable course; but when life ends, lo! the running has been all in the wrong direction: there is nothing attained. So much for men's little observance of life: its inner meaning, its whole plan, its object and end. So much for men's disregard of the phenomena which nevertheless meet them and act on them as they pass through this life.

And now for these cast-off skins.

I think the notion first came into my mind, or was, at least, fixed there and assisted, by a walk that I had in those sweet summer days which opened May this year. I was walking with my wife in a quiet lane, leading only to fields, under a canopy of beech leaves. The long, slender, lady-like branches slanted upwards over the palings, and quite across the lane, and the clean glad shiny leaves, all just new from God's hand, refreshed and rejoiced us by their cool shade, by their shimmering green, glinted through here with sunlight and darkened here with segments and patterns of leaves above them. But my wife drew my attention from the roof to the pavement of our cloister walk. This was quite over-strewn with a sienna carpet, lying thicker in the cart ruts, but thinly over all. And we perceived at once that this was composed of the numberless sheaths of the liberated beech-leaves above us. They were cast-off skins.

Soon afterwards, there came, at the evening of one sultry day, a grand gloom over the heated misty blue; and a jagged gleam or two stabbed the sight, and after a pause, a great cataract of sound poured down upon the silent earth. Then a close, continuous, steady, heavy rain.

How far into the night this lasted, I cannot say. But there were some broad majestic rounded chestnut masses at the bottom of the garden, all prepared with thousands of, till lately, unlit tapers. Methought they had been preparing for a grand white decoration for Whitsuntide; but if this were their intention, the sudden summer heat overruled it, and they had glorified themselves to the full some weeks before the time. Then came this heavy, windless, rushing rain. And next morning I sauntered round the garden according to my wont, to enjoy the dark, refreshed mould, and the developed grass, and the moist, hot-house atmosphere, and in my saunterings I came within the domain of those resplendent domes. And I found a strange fairy transformation of the black bald ground with the few thin hairs of long weak grass, that I had, as by instinct, expected to find under them. A wide white sheet, all made of tiny mosaic bits, with spots,—soft and faint-edged, like porcelain-painting,—

of rose:—what a very lovely pavement it was! Showering down still; and each piece so fresh and clean, settling without defilement upon the dark drenched ground. I lamented the despoiling of the domes; but truly their wealth seemed well disposed, and the costliest tessellated work would have looked dim and mean indeed, alongside of those myriad patines of rose-stained white. But meanwhile the young nut left behind on the boughs was swelling and developing; it was passing on into another stage, and could afford to cast off even all that fragile loveliness which had once clothed and assisted it.

I must play with some more instances, before I come to the slight human parallel, which seems to me to run side by side with them. There are myriad cases (I do not intend a pun) of these cast-off skins, which it is pleasant to watch, possibly even to read about. And if my moral be of the feeblest, the way by which we walk to it may be made interesting,—especially to those who dwell far from English flowers and trees,—by our pauses to study those silent sympathisers.

There is the *eschscholtzia* with the pretty fringe of its pale, bluish leaves, scattered all over our flower-beds, self-sown; almost a weed. You shall see divers little stalks with peaked heads rising between the fringe; gradually growing larger, and developing: standing up bravely at last, with a goodly full pike-head of green. Next you shall see a split widen towards the base of this head, and a golden yolk of yellow gleam through:—widen more and more, until something of an absurd effect is perceivable. For a tall pointed nightcap, sometimes stuck rakishly on one side, crests the petals, and keeps them close folded like an umbrella; staying in some instances quite provokingly long; so long that, however unwise it be to interfere, you can scarce help giving an aiding hand. But at last the green case falls on one side, and the broad yellow banner is unrolled and flaunts out in wide freedom.

There is the *narcissus*; of course I mean the pheasant-eyed kind, not those with dingier white, and with no scarlet. The tall narrow leaves droop gracefully on this side and on that, and out of them the queen-flower rises, a pure-petalled star of a blossom, about whose frilled cup-centre runs the scarlet-threaded edge. How white, how dazzling, looking up out of that wet-brown bed! Did it fall from the sky, and poise upon that slender stem, new made, complete, perfect, at once? Must it not be amaranthine? and had it ever an infancy? Can we imagine that at any time baby-wraps swathed undeveloped petals, in this royal instance? I know not what we can imagine: but if we examine the flower (descending from our rhapsodies), we find the garment of infancy, the cast-off skin, still clinging to the long olive tube out of which the petals dawned; out of that pale-brown, dry, shrivelled skin (which mars not, but enhances the beauty of the flower), out of this discarded wrapper the closed bud escaped; and, making use of its liberty, threw open this starry loveliness above the dark earth.

There is the poppy. Upon a dry dusty way-side bank through which the chalk shows here and there; a little apart from the sulphur snapdragons, and the white or yellow masses of bed-straw, and the orange shoes-and-stockings; and the azure, fringed succory flowers,—a little away from these, you shall find a settlement of vivid poppies. Up from the hairy drooping leaves rises the thin hairy stem that bears the bud. Many a one may be seen, bending earthward, and clad in dull downy green. Across this, however, a mouth splits, from ear to ear, and a hint is given of the concealed

splendour within that sober case. And so gradually it pushes forth, the resplendent scarlet, forcing its way all sideways and awry, like a sleek shining silk dress, but crumpled sadly, you would think, past remedy. But it squeezes its exit more and more, and now you think it more like a doctor's scarlet hood, as it bulges and develops, not yet enfranchised. At last, out it flares, vivid, glowing, magnificent, and then you change your mind again, and settle that it is—well—a scarlet poppy. And the two sober discarded cups slink humbly out of sight behind the broad, black-enhanced glare.

Then there are lords and ladies, too often—yet no, I remember my own childish delights—often, then, untimely, brought from the seclusion of their pale-green tent. If left alone, however, lo! in time, the tent's folds are solemnly drawn aside, and there sits, upon the cunning ivory throne, the lord in his purple or the lady in her gold, until the tent is quite struck, and the proud inhabitant departs, and the bright orange berries burn out of the long grass, no trace being left of the case out of which they rose. There is the sycamore seed, pushing out of the rich leaf-mould, a little black cap on one side of its head, escaping from which, with some amount of effort, two green streamers unroll themselves, and spread out in triumph this way and that. There is the beautiful corn family, brothers and sisters; the wheat bursting its sheath and standing up erect and proud above its leaves on its tall stalk; the silky silver-green threads of the barley squeezing out, all bent and tumbled, but straightening themselves and stiffening into a martial bristling array; the straggling oats slipping out one by one, and scattering themselves, spike after spike on its thread stem, in an ever-falling, never fallen rain; the bold maize, with its many tiers of squared, dull-yellow grains, showing themselves through the side of the great buff envelope, dry and withered, and needed no more. There are—well, a plenty more instances of cast-off skins, in flower and grass land, with which I need not weary the reader. Only it must be said of the brave petals, white, scarlet, orange,—over which we have rhapsodized, that even these are in turn cast aside as were their calyxes, for further developments. The corn, too; further husks have to be, with much pain and *tribulation*, removed from the grains, before the white final condition is attained.

Snakes and newts and toads: these are all frequent casters of skins; but none of these develop in the way which we at present want to consider, so we pass on to the caterpillar. You find these, first, in writhing heaps; naked tumultuous bodies, exaggerated black heads; and so they remain awhile, cast their skins, and separate. Somewhat bigger now, but not beautiful, nevertheless you are amused to watch the little creature on its leaf, cutting segments of circles on the edge: body quiescent, black head moving with busy fangs, going regularly on, round after round, to widen the neatly-cut gap. And so it casts its skin again; and again; and again. And now it bustles on with long undulating body, over its nettle or across the path, or up its stem; and at last it creeps up a wall or behind a shutter, or into the mould; or slings a hammock from some forked twig:—and grows sick;—and dies?—no;—casts its skin again. And under this last caterpillar skin is found a ready-made coffin,—sometimes yellow-grey, prickly, speckled: sometimes red-brown, smooth, armadilloed (but always able to wag its tail)—in which coffin for the present we will leave it lying. Especially may we select for our purpose the chrysalis of the sphinx-moths. These we leave lying in their coffin, buried many (caterpillar) feet deep under the ground.

No doubt we men and women have our share literally in this skin-casting process; you gradually peel, as your coat or black dress will tell you, in little flaky bits. After a fever, the process is observable enough. All this, however, has little to do with my present thought. I am not concerned now with your physical, but rather with your metaphysical skin. Let us see how, at the end, say, of each seven years, this is cast.

A little writhing baby, with top-heavy head and leg-of-mutton arms, your ideal of happiness, at first, to swill milk from certain convenient lactucts; to stare vacantly and to be sick, to be bounced at by energetic mother and nurse, and have all sorts of fearful sounds made at you; to be tossed up and down, and to subside into tranquillity with your thumb in your mouth, like Noel Paton's "Changeling." Later, to grab at everything near you, father's nose, your own pink ribbons; especially anything breakable on the table or mantel-piece: and, when at all possible, to ram the article into your mouth. You develop, no doubt, into higher and nobler pursuits: into an appreciation of yellow woolly birds, of rattles, of sodden crusts in net; even aspiring (raised by the help of chairs, and sidling along them to the table) to land the table-cloth (with the ink) upon the floor. And thus you progress, and cast your first skin.

A boy now: turning (with something of a Colenso spirit) in contempt even from Noah's arks, bricks, large particoloured balls (that shrivel so deliciously for the moment, within their net, when pricked), carts for timber, and donkeys with nodding heads. You despise these; are impatient with your little brothers, who (not having cast their skin) still care for them; you are a cricketer now; a ship-builder, and (to your mother's much anxiety, and your nurse's deep disgust) a ship-sailer also; you have bow and arrows and a small target; and become a very Esau, in trouble with every one. Your mother (at least your father) does not like your legs on the table at meals; the washerwoman cannot see the wit of your shooting with dirty arrows (however blunt) at the white linen that swings from her lines in the wind; the gardener does not sympathise with your raids after these same arrows, or after your ball, among his potatoes, or across his fresh-raked beds; your sisters think you a tease; your brothers, a bully; the servants, *unbearable*. In fact, perhaps there is little lamentation and some relief, when the second skin is cast, and (after a short period of nakedness and rawness, in which you of course feel uncomfortable enough) you merge the young man.

Other playthings now; human playthings, edgetools. 'Tis sentiment now; and love, and fierce hunting after shy, elusive, vexing, fair-skinned game. Two or three hunts generally before the right one is run down, and time has come for casting the next skin. Fire and energy, and a look abroad, as of Moses, from your hill, into a promised land of perfection, nobility, loveliness,—that you shall not enter until a certain river be passed. And through all, you chafe and weary to quit this skin (though it be beautiful) for the next. I suppose an instinct within whispers that this is still imperfect; that the perfect state lies somewhere and somewhen beyond. And so you are impatient; unsatisfied with the abundant leaves about you; always wandering off to the edge of one, and rearing on your hind legs and staring and swaying, and weaving pictures and dreams to yourself of the unknown;—of what may underlie the next skin, in fact.

And so this skin is slipped; and manhood comes,

and you are married and settled down in life. Some bright hues are lost; you are a little sobered; but (often) looking downward, rather than upward, you find on a sudden how many leaves surround you, how much good practical, substantial eating has to be done in life.

"'Tis looking downward that makes one dizzy."

But you think not so; you care more for cabbage leaves than for spinning dreams in the air with restless head; and certainly, if we look at the thing from a business point of view, it may be more useful. Still,—still,—what shall I say? There grows upon you what I call a loss; yes, certainly I shall venture to call it a loss. An increasing forgetfulness of that old restless instinct: a lower satisfaction with the present:—an absorbed thought of that on which you stand and which you eat:—a lack of that (now and then) going to the edge of it all;—and staring, and rearing, and twisting, and wondering, and longing,—after what? beyond. Life's purpose seems too much merged in the present; too much bounded by the evanescent and limited sphere in which you are living; in many that divine instinct dies out; they perceive no more those hints of how this state is still imperfect: of how there are other skins yet to be cast: of how there is a strange, unfathomed future beyond the buried chrysalis,—eyes fixed intently on the leaf, unconscious of, or unheeding, the wide wings that flash above them on the flower.

Now the flowers which we stopped to examine on our way to these thoughts reached their acme of perfection at the point at which we left them, and they then fell, the fair petals, without a future.

"No second life have they in store,
But where they fall, forgotten to abide,
Is all their portion, and they ask no more."

This teaching, however, they have for us: that their life is one of development through each stage; one of increase in loveliness, in spirituality. They do not deteriorate, each change adds a beauty, they go on to perfection. At least they do so, unless some egg, implanted by an enemy in the earliest bud, and not removed, shall develop, and grow to an ugly grub, and so eat out the heart of the flower, insomuch that, if the case be opened, a black vile maggot writhes out of the ruin, instead of the loveliness that should have been disclosed.

We need not go on with our version of the seven ages, or (as we put it) skins, of man. Remembering that the skin is metaphysical, you will perceive that he also may (as he should) go on developing, improving, to the end; also that he may be advancing backwards, developing downwards, losing, with no corresponding or compensating gain. And so on to the chrysalis condition, and the burial in the mould. You will then agree that, metaphysically, we do cast our skins periodically; swelling, developing, growing too large for the last, which tightens, shrinks, splits,—and is left behind in life. One's self every seven years; what a series of different beings! What we were, and what we are! Some preserve their old skins; some, on the other hand, put them out of sight and remembrance as effectually as does the toad, which (you know) pats its cast skin with hands and feet into a comfortable ball,—and takes it like a Norton's camomile pill! But this lesson of *development* all through life's different stages, this intended growth (metaphysical) towards something more perfect, more beautiful, as skin after skin is cast off;—men lose sight of this. And many have a hazy notion that they shall somehow be able to cast half-a-dozen skins all at once, at life's end, and so come out that perfect thing which all life's

years were meant to lead to. The process is one not patent to the eye; thus they do not perceive how that inner thing, the Self, is shrinking and dwindling, instead of plumping out and shedding skin after skin *towards* perfection of character. They eat busily at the leaf they are on, and miss the purpose and intention of life.

Such men would, I doubt not, sneer at my vagaries and (they might think) impertinent analogies. It does not occur to them that there is any need of study to understand this mysterious thing, this mortal life of immortal beings; nor that to the intent heart and the observant eye it is surrounded by parables, hints, and indistinct, yet grand suggestions. They take it in a matter-of-fact way,—dealing with it as though there were nothing below the surface. Yet, in truth,

“There are more things in heaven and earth, Horatio,
Than are dreamt of in our philosophy.”

And many a poem is being wrought out, in the processes and existences around and beneath us,—poems full of solemn sweetness, profound meaning, echoes of revelation. And as to the present theme, I need not do more than hint at the well-worn, but ever-new and beautiful analogy, joined with the last skin-casting of our friend the caterpillar whom we left in his coffin, and under the mould. Ah, how much of glorious anticipation seems offered to those who will accept it, when we behold the last change of the creeping insect!—the transfiguration, the radiancy and beauty, the power to soar! In what variety of loveliness, out of so many hiding-places; nor only from the earth, but out of the waters, springs that new and glorious life. I must remind those who need such reminding of one famous description of this latter resurrection:

“To-day I saw the dragon-fly
Come from the wells where he did lie.

An inner impulse rent the veil
Of his old husk; from head to tail
Came out clear plates of sapphire mail.

He dried his wings; like gauze they grew;
Through crofts and pastures wet with dew
A living flash of light he flew.”

But I must just note down a curious and even startling counter analogy, described by Archbishop Whately in his annotated edition of “Bacon’s Essays.” I must quote from memory, as I have not the book by me. He describes there how an egg may be deposited in the earliest stage in the body of the caterpillar by an enemy fly; how this egg shall hatch into a parasite, which shall live on in the grub through all its growth and changes, not at all interfering with the outward present life; so that the creature eats and grows, and goes through its existence much, to all appearance, like its fellows; even, like them, passing into the last stage but one, and sleeping in its coffin. But here an end. The hidden enemy had been all through its life feasting on the inner self, the spiritual thing within the creeping grub;—and the dark coffin lies silent, unopened. *There is no butterfly within!*

HIGH TEESDALE.

ANOTHER link in the railway system means “fresh woods and pastures new” to the inland tourist. The iron road which crosses England from Middlesborough by Darlington, to Tebay for Windermere, follows the Tees from the German ocean to Barnard Castle, and then swerves to the south and crosses the Pennine chain

into Westmoreland. A branch of nine miles from Barnard Castle, recently opened, leads to Middleton in Teesdale, the village metropolis of Lead Mining.

On landing at the station the sides of the open valley are seen to be sparingly sprinkled for miles with glistening white houses, an external coat of whitewash being the territorial sign of the Dukedom of Cleveland, the successor of the Baliols. A small cluster of these tenements four miles off, just distinguishable in the neck of the valley, is the High Force Inn. Beyond this, the slopes rise on both sides, up to the horizon of the fell-country which forms the water-shed of the rivers, and is termed the Pennine chain. About the sources of the Tees, the five counties of York, Cumberland, Westmoreland, Durham, and Northumberland unite. But we have something to say before we get to Middleton. After crossing the Tees near Barnard Castle by a magnificent viaduct, and leaving the main line, we pass over a gorge bearing a name dear to Antiquaries, Balderdale.

The names hereabouts, Balder-dale, Odins Croft, Bail-hill and Thorsgill, have impressed antiquaries with the notion that we are passing a seat of primitive Scandinavian occupation, and that the heathen invaders have left us at least their names as the marks of their dominion. The rival rendering is *Bald-dur*, the strong stream. We will not enter into the vexed question of etymologies: the dale, with its rocky wooded sides, and a few ruined walls at its entrance (remains of a stronghold destroyed by a raid of Scots), is worthy of exploration, whether we people it in imagination with the shadows of old Pagans or not. At Bail-hill are traces of a British earth-work whereat coins of Edward the First and of Alexander of Scotland were found, as though it had been a station in former warfare.

Romaldkirk is distinguished by a fair tower standing up nobly on the hill-side. Its church is early English (about Edward the Third), and has a recumbent effigy of a crusader, supposed to represent Sir Fitzhugh who died in 1304 at Cotherstone Castle. Romald was a local saint whose virtues did not reach Rome.

Cotherstone, once renowned for the castle of the Fitzhughs at Hall Castle, is now of wide fame for its coveted cheeses, into the value of which the tourist will do well to make experimental enquiry at his noon-day quarters. Romaldkirk and Cotherstone are both rich in school endowments. The opposite bank of the river is Egglestone. The highest summit of the wooded bank is Foxgill, the view from which excites the most animated descriptive powers of the county historian.*

We now come to the Lune, a favourite dale for artists and scientific folk, and shortly after passing by Mickleton, the Fells are fuller in sight, and we are at the terminus opposite Middleton.

There is no point in all the Dale so advantageous as Middleton for viewing the Fells. A peculiar sense of loneliness, at times almost unbearable, is induced by the vast silent valleys and rough round hills; and though there are few effects of rock and ravine such as Poussin delighted to paint, yet the dread and awe which are induced by his pictures are equally felt under the influence of Fell scenery. Not that the rock and ravine are wanting, but only that the first impression produced on a stranger by this country owes its distinctive character to its general aspect of loneliness and breadth.

The geologist will see a fine example of split and contorted rock in Skears valley, which runs up behind

* Hutchinson’s Durham, vol. iii. p. 276. 1794.

Middleton and at right angles with the Tees. Here a little stream, often clouded by the mine-washings, dashes down from the shoulders of a distant fell, and forces its way between the rocks of a ravine where the ivy mantles the precipice, and the daring rowan hangs its scarlet berries

lead from their treasure-house. Where this insult has been shown them there is a brown gash in the hill-side, but the heather and stunted herbage soon recover their lost ground, and nothing else relieves the solemn monotony of their reign.

HIGH FORCE FALLS.

on many an imminent deadly breach. On the right of this rivulet nearer to the village there is a huge boulder of stalactite like petrified moss. The spring bubbles up just above it, and is the favourite haunt and wonderment of the children, whose eagerness in the pursuit of science even leads them to sacrifice the immediate enjoyment of the hazel nut and apple for the sake of receiving them back after a lapse of time coated with calcareous sediment.

From any spot above Middleton a grand view presents itself of the surrounding country. Looking down the valley the river winds in and out round knolls covered with fir trees, under scarped out banks, beneath the black pine-clad shoulders of Egglestone, and is then lost to the eye, but its course is distinctly traceable to Barnard Castle. On the horizon it is almost a relief to have the black and barren incline broken by one clump of trees that rises near Richmond. On a clear day it is just possible beyond the rolling smoke of Darlington, and the furnaces of Middlesborough, to catch a silver gleam of the sea at Redcar.

Turning to the other view we lose the last trace of verdure, no single corn field gladdens the eye; seasons come and go, seed time and harvest pass, but the wild fells hold their own as "monarchs of all they survey." Their majesty has only been disturbed when the adventurous miner has rent their royal robe to "hush" the

Above the Tees, on the opposite side to the Force, there nestles the little hamlet of Holwick, wilder and more savage than any in all the district. The houses lie under a lofty cliff, not unlike the scenery around the Giant Causeway in Ireland, and few of the thatched roofs but have suffered from the wildness of the winds sweeping down the valley. The Primitive Methodist chapel can only be distinguished from a cow-byre by the inscription over the door. A few years ago a traveller was murdered on the heights of Holwick Scar, and the suspected murderer when charged with the crime denied it vehemently—wishing that his right hand might wither and decay if he were guilty. The terrible legend, which rests, indeed, on more than a legendary basis, affirms that the fearful curse fell on him, and that he died not long after in great agony.

From such a dreary recollection it is pleasant to find relief, such as is presented in Fairy Dell. This is an exquisite little glen, a mile or so nearer Middleton, on the right side of the Tees. Two of the streams, which have their rise in the heather marsh above, join their waters, and come tumbling widely down a ravine quite secluded from sight until the visitor is close upon it. The cataract is broken midway on a ledge of rock, and then "falls like a broken purpose" into a black basin beneath, fringed with fern and heather.

Half-way between the High Force and Middleton

the river is crossed by Wynch Bridge; which has the local reputation of being the first wire suspension bridge put up in England. There is no more beautiful point in all the Tees than this. The waters, chafed into rage against the rock, swirl round a little island midway in the stream, and then fling themselves in a hundred cataracts down into the part under the bridge. This is a favourite haunt of the fisherman, and is sometimes the scene of another "sport" not altogether so harmless as the gentle craft. The mischievous village lads from Holwick and Bowlees, the hamlets on either side the river, amuse themselves by occupying each party one end of the bridge and keeping it in a perpetual state of vibration with their heavy clogged feet, much to the imperilment of the peace of mind and body of passengers.

The turbid mass of waters foaming under the suspension bridge gives the first preparation-note for the grander effects which are to be found two miles higher up the river. Here the Tees, after receiving the tributaries of two or three small streams, flows on with glassy smoothness to the verge of a precipice seventy feet deep, over which the whole river is hurled into a black basin beneath. Nothing can exceed the glowing grandeur of this scene, high rocky barriers shut in the waters—the wild fells stretch away and away beyond—above Cronkly Scar crowns the height. All the approaches to the Fall are through dark masses of pine trees, and the grey clouds overhead completed the sombre effect of the whole.

The constant pressure of so great a volume of water is said in the judgment of that indisputable authority, "the oldest inhabitant," to be wearing away the channel of the river, and slowly, but surely, diminishing the height of the fall; but whatever old eyes may see of lessened grandeur, to a stranger's, Tees High Force will seem to stand alone amongst English waterfalls, in the breadth of the fall, the passion of the swirling waters fretted and chafed by the rocks in the bed of the stream, the deep sullen roar which all the year round greets the ear as one approaches the scene, and above all the sombre gloom of its surroundings. To see the Force, however, in perfection it should be visited in the sudden thaw of early spring, when the ice beds are broken up in the Weal and Cauldron Snout, and masses of rock bedded in ice are swept down over the cataract and on to Wynch Bridge in the flood. Of course the Fall suffers (as all our falls do) in seasons of drought, but we know no other that suffers so little. The glories of Lodore at its fullest are unworthy to compare with those of Tees High Force, even when it is in very low water indeed; and even the ducal pride of the Cleveland in their favourite shooting box has not given to the Teesdale line that diletante guide-book air which mars our enjoyment in the English Lake falls.

Above the High Force there is a delicious pastoral vale, fertile in rare plants, and whose sides are formed of the fells in many forms and colours. The landscape becoming wilder, the Blae Beck comes down in a series of most picturesque cascades from the small tarns on the summit; next we see the rugged basaltic cliffs of Cronkly, green with juniper, and abundant in botanical curiosities; then, after another wind among very rugged rocks, or a walk over enamelled meadows and rough bog, we reach the crowning waterfall, as regards height, Cauldron Snout, where the Tees flings itself over a staircase of two hundred feet torn out of the solid barrier of a whin.

Then there is the long silent level of the Weal, and above this the fells of the summit—the sources of the

great rivers which give names to the industry of the north of England, the Tyne, Wear, and Tees.

The highest of the Yorkshire fells, Mickelfell, is not picturesque on the Teesdale side, but the far-off summit of Cross-fell is quite worthy to close the landscape. A short traverse through High-cup Nick, or one or two other passes, leads into the basin of the Eden, or of the Tyne or Wear.

The general character of the landscape is that of an upland pastoral district, surmounted by heather-covered hills, gullied by ravines with rushing streams.

The population is principally engaged in mining, but in a manner which does not interfere with the landscape. The lead is contained in narrow veins which are worked on the slopes of the hills by an adit level driven at the foot of the hill, and then the vein is taken down, the ore extracted, and the rubble used to fill up the vein again; so that there is little refuse at the mouth of the level, and no machinery for drawing, no engine, no buildings, save at the dressing floors. The miners live for the most part in Middleton, or on small farms, which they cultivate during their turn to be at surface. The effect of the latter on their health is favourable, though even with this advantage lead mining cannot be called a healthy occupation. The frequent cases of consumption, and the sallow looks of the regular miners, testify to the contrary. The overmen, who are less underground than the ordinary miners, are healthy looking and live to attain full age.

The people are, as a whole, unusually intelligent, a fact which is not to be wondered at when it is remembered that the lead company devote much attention to the education of the children, and that Methodism has in one or other of its divisions obtained a firm hold in the village life of the Dale. Living remote from the fluctuation of trade, under constant average of prosperity, the demoralising influences of want have not been felt so fully as elsewhere in England. This has had an effect on the general tone of the people, has made them kindly and hearty, whilst education and religious influences have added the elements of thoughtfulness and shrewdness.

Lead mining has been carried on in this district ever since the days of Queen Philippa, and probably long before. The shallow pits on the course of some of the principal veins are the traces of the "old men." The old system of mining by extracting the vein stuff from the surface and washing it to extract the lead, is locally termed hushing, whence the term "hush" for a work of this kind. It has made the remarkable ravines crossing the crest of the hill above Newbiggin and elsewhere, which now form a curious feature in the landscape, and furnish an artificial valley, which rain and rivers slowly widen. The old system appears to have occupied a considerable number of persons; and when the time arrived, that it could no longer be pursued with mere labour, but required capital, poverty and distress appeared. Then came a royal and noble company, set on foot by the nobility, and worked with an enormous apparatus of cost, which failed almost immediately, and the condition of the country became worse than ever. An Act was passed in the days of Queen Anne for winding up the concern. The sad condition of the population struggling against natural difficulties, sunk in indigence, obtaining only casual and uncertain profits whereon to subsist, attracted the attention of a benevolent Quaker lady who was travelling through these parts. On reaching London she suggested the application of capital, and the result was the formation of the Company of Mine-adventurers of

England, the oldest mining, perhaps now the oldest trading, association in England, principally composed of members of the Society of Friends. The career of the company, which is now in greater vigour than ever, is perhaps the most signal instance in the world of a great enterprise based on varying profits, conducted for centuries on enlightened principles of commerce, and at the same time on principles of sound philanthropy. The schools, libraries, and places of religious worship, the public provision for education, the compulsory attendance required in schools, the method of letting the work, whereby the men are partners in the gains, have resulted in a state of things extending over upwards of 100 square miles, which, for the benefit it has conferred and is conferring, is worthy the attention and study of all who desire the knowledge of great social problems.

The effect of compulsory education, both in Sunday and day schools, is to interest all the dalesmen in the celebrations connected with the schools. The Sunday school anniversary is the occasion for a display of histrionic talent on the part of the boys and girls, who personate "Cain and Abel," "The Three Hebrew Children," or some other well-known Scripture piece, in a dialect that is sufficiently startling to the chance visitors. Along with their annual displays of course goes the irrepressible "tea." How religious fellowship could be maintained without this institution it is difficult to imagine. At the annual tea-drinking of the Baptist chapel in the new school-room at Middleton, which is held on Christmas Day, all the country side flocks to the scene, regardless of the pelting hail or heavy snow-fall; a brass band is engaged for the occasion, and the voice of "all kinds of music" alternates with the addresses of the speakers through the after-meeting. The undisputed rule of tea has, however, of late been threatened by its rival, coffee, as we saw in the shop windows at Middleton an invitation to a "coffee supper!"

High Teesdale is scarped out of one geological formation only, but this one consists of a series of layers of hard unfossiliferous grit-stone, alternating with layers of thin shales, and fossiliferous limestones. The whole series is called mountain limestone, and forms the lower portion of the coal measures. There are scanty traces of coal and coalplants in the grits, with traces of large marine worms (crassopodia) on some of the surfaces, and abundant corals and shells in the limestones. The shales decay faster than the limestone, and the limestones wear away faster than the grit; hence the terraced-like form of the hill sides, the slopes being shale, the platforms grit, and the bold cliffs or scars limestone. But the chief geological notabilia in the dale are, first—the great Teesdale Fault, a disturbance which has split the rocks in the direction of the valley and raised one side or depressed the other by a throw of several hundreds of feet; so that limestone, which is in the bed of the river on one side, is raised on the other side into a cliff 300 feet high. This great dislocation occurred since the consolidation of the strata, and, probably, gave rise to the first outline of the valley. Second—the great whin-sill, or volcanic outburst, which is first discoverable on the Foggerthwaite bank of the Tees, opposite Mickleton. Crossing the river we next find it on a higher level, kept up by the fault under Laithkirk chapel, where it is about ten or twelve feet thick. Thence it extends up to Holwick and helps to form the picturesque scars and sides of the fairy glen. Through Holwick we trace it to the river below Wynch Bridge, and here it becomes thicker and more fully developed at

surface. It forms the rugged bed of the river, rises with the strata, and is the uppermost bed at the High Force. It is now seen in the beautiful mural crags of the White Force, in the beck which rushes over the forehead of the mountain, and thence crowning the magnificent precipices of Cronkly, which form a grand amphitheatre of rock. Here it is rudely prismatic and columnar. At Cauldron Snout it is the bed of the waterfall which owes its character to the jagged and hard masses which here present a vain barrier to the waters.

There are ample opportunities of observing the structure of the country, the little becks cutting into the rocks, the scars and even the "hushes" of the mines, all display in an interesting manner the geological features. If fossils are scarce, and in ill-condition, the collector may make up for his disappointment by collecting minerals, of which some specimens may be got from the vein stuff at the mines.

The floral beauties of Teesdale are, as might be expected from its sub-alpine character, somewhat minute, but yet its rarities are very considerable. So much so that it is probable the banks of the river above the High Force yield to no district in England in botanical interest. The pretty little primrose, *primula farinosa*, follows the river almost from its source to the sea, but it is specially abundant in the enamelled meads about Widdybank. Some of the rarer orchids are also abundant here.

The "coffee supper," of which notice has been taken, reminds us naturally enough of the first planting of Methodism in the Dale, for it was in a farm house on the same spot that the itinerant preachers received their earliest welcome from a farmer whose descendants still occupy the same place, and still show hospitality to the ministers. Somewhere about 1750, having been driven out of a house where they had at first found shelter, the preachers were received into Low-Houses, a long white farm house easily to be distinguished between Newbiggin and the river Tees. At Newbiggin the pulpit is still reverently preserved, from which John Wesley himself preached. The names of the first converts to Methodism—Allinson, Bainbridge, Richardson, Coatsworth—are household words in Teesdale to this day. The first preaching of the Gospel was much opposed. Wesley was played upon by the fire engine in the streets of Barnard Castle. Matthew Rowell was flung by a drunken mob over the battlement of a house into the street below, at a preaching place on the site where Middleton House now stands.

William Richardson—Willy Ritson as he was familiarly called—was once the hero of an amusing incident which very well illustrates the wild life of the dalesmen a century ago. "Arrangements had been made amongst the miners for a great cock-fighting match to take place at Middleton, between the Weardale and Teesdale main. Some of the combatants had to be sent from Manor Gill shop to engage in the bloody scene, but it became a question amongst the men as to the most proper person to be entrusted with such a commission, no little jealousy of each other being entertained. A thought however darted into the mind of some individual more penetrating than his fellows, that if Willy Ritson could be got to take charge of them, they could not have a better man. They obtained his consent to deliver a bag, in which they had deposited the cocks, at a certain house in Middleton, without acquainting him with the contents. As he trudged along over the fell, the secret was betrayed by one of the chanticlers popping his head through a hole in the poke, and setting up a loud

crow. Willy was no doubt at first a little startled, and indulging his soliloquising reflections, began to ruminate on the evils which his innocent companions would occasion; the cursing, swearing, gaming, &c., all presented themselves to his glowing imagination. But could it not be prevented by destroying the cause? The thought was father to the deed: he took them out one by one, wrung off their necks, replaced them in the bag, and delivered it at the appointed house: As may be easily conceived the fury of the cock-fighters was unbounded, and in the first transport of their rage, his life was in no small peril."—(History of Methodism in Barnard Castle, by Anthony Steele.)

All opposition notwithstanding, the preaching of the Gospel, earnest, hearty, simple, by Wesley and his band, began to tell on the district. Each little hamlet and village had its one or two families who were obedient to the truth; then the room got too small for the members, the chapel took its place; and soon, from Barnard Castle to the Tees High Force, there was a chain of preaching stations which continue still. Wesley's words are descriptive of the triumphs of the Gospel over wild and savage hearts: "I have not found so deep and lively a work in any part of the kingdom as runs through the whole circuit, particularly in the dales that wind between these horrid mountains."

Other religious bodies have planted themselves in the valley following in the wake of Methodism, but none of them have become so thoroughly identified with the spirit and disposition of the people. In the village of Cotherstone there is an old chapel and chapel-house with a rough coat of arms over the door, which carries us back to the times of the great restoration of the Established Church in 1662. The thatched roof of the dwelling house was burnt down lately, and now presents rather a desolate appearance, leading no doubt to a restoration which will probably issue in a new Gothic chapel, more favourable for worship, but stripped of all the pleasures of memory which cling about the old sanctuary in which for two centuries service has been sustained. Nor should we omit to mention the picturesque cottage and chapel belonging to the Baptists in Middleton, where apple and pear and cherry ripen on the wall, and cluster round the windows. To the same body belongs the little ivy-matted sanctuary perched on a rock not far from the High Force Fall, sufficiently near for the preacher's voice to be disturbed by the roar of the waters, and howl of the storm in times of flood and tempest.

P.

BROUGHAM AND CANNING, IN 1823.

THE announcement of the death of Lord Brougham carried us back to times far beyond the present generation. Born at Edinburgh in September, 1778, he died at Cannes on the 8th of May, 1868, when within four months of ninety years. An outline of his extraordinary life has already appeared in our pages, with a portrait of "the old man eloquent" ("Leisure Hour," No. 460). Leaving to formal biographers the fuller record of his career, we present to our readers a graphic sketch, by a cotemporary of forty-five years ago, of Brougham and his great parliamentary rival, Canning:—

The men who, during the session of 1823, were foremost in eloquence, if not in influence, in the hostile ranks of the Opposition and the Administration, were Mr. Brougham and Mr. Canning; and to them not only their respective parties, but all those who took an in-

terest in the proceedings of the House of Commons looked for some great trial of strength.

So much was this the case, that it is important to show wherein they were alike, and how they differed. They had this in common, that their wealth and their ancestry stood them in little stead, and they had not been remarkable for political consistency; yet each was, in his party and his style of eloquence, not only absolutely without peer, but almost without a follower. Yet, though they resembled each other in standing foremost and alone in their respective parties, they were in every other respect opposed, as the zenith and nadir, or as light and darkness.

This distance extended even to their personal appearance. Canning was airy, open, and prepossessing: Brougham seemed stern, hard, lowering, and almost repulsive. The head of Canning had an air of extreme elegance; that of Brougham was much the reverse; but still, in whatever way it was viewed, it gave a sure indication of the terrible power of the inhabitant within. Canning's features were handsome; and his eye, though deeply ensconced under his eyebrows, was full of sparkle and gaiety: the features of Brougham were harsh in the extreme; while his forehead shot up to a great elevation, his chin was long and square; his mouth, nose, and eyes, seemed huddled together in the centre of his face—the eyes absolutely lost amid folds and corrugations; and while he sat listening, they seemed to retire inward, or to be veiled by a filmy curtain, which not only concealed the appalling glare which shot away from them when he was aroused, but rendered his mind and his purpose a sealed book to the keenest scrutiny of man. Canning's passions appeared upon the open champaign of his face, drawn up in ready array, and moved to and fro at every turn of his own oration, and every retort in that of his antagonist: those of Brougham remained within, as in a citadel, which no artillery could batter, and no mine blow up; and even when he was putting forth all the power of his eloquence, when every ear was tingling at what he said, and while the immediate object of his invective was writhing in helpless and indescribable agony, his visage retained his cold and brassy hue; and he triumphed over the passions of other men, by seeming to be wholly without passion himself. The whole form of Canning was rounded, and smooth, and graceful; that of Brougham, angular, bony, and awkward. When Canning rose to speak, he elevated his countenance, and seemed to look round for the applause of those about him, as a thing dear to his feelings; while Brougham stood coiled and concentrated, reckless of all but the power that was within himself. From Canning there was expected the glitter of wit, and the glow of spirit,—something showy and elegant: Brougham stood up as a being whose powers and intentions were all a mystery,—whose aim and effect no living man could divine. You bent forward to catch the first sentence of the one, and felt human nature elevated in the specimen before you; you crouched and shrunk back from the other, and dreams of ruin and annihilation darted across your mind. The one seemed to dwell among men, to join in their joys, and to live upon their praise; the other appeared a son of the desert, who had deigned to visit the human race, merely to make it tremble at his strength.

The style of their eloquence, and the structure of their orations, were just as different. Canning chose his words for the sweetness of their sound, and arranged his periods for the melody of their cadence; while, with Brougham, the more hard and unmouth-

able the better. Canning arranged his words, like one who could play skilfully upon that sweetest of all instruments, the human voice: Brougham proceeded like a master of every power of reasoning, and of the understanding: the modes and allusions of the one were always quadrable by the classical formulæ; those of the other could be squared only by the higher analysis of the mind; and they soared and ran, and pealed and swelled on and on, till a single sentence was often a complete oration within itself; but still, so clear was the logic, and so close the connection, that every member carried the weight of all that went before, and opened the way for all that was to follow after. The style of Canning was like the convex mirror, which scatters every ray of light that falls upon it, and shines and sparkles in whatever position it is viewed: that of Brougham was like the concave speculum, scattering no indiscriminate radiance, but having its light concentrated into one intense and tremendous focus. Canning marched forward in a straight and clear tract,—every paragraph was perfect in itself, and every corruscation of wit and of genius was brilliant and delightful;—it was all felt, and it was felt at once: Brougham twined round and round in a spiral, sweeping the contents of a vast circumference before him, and uniting and pouring them onward to the main point of attack. When he began, one was astonished at the wideness and the obliquity of his course, nor was it possible to comprehend how he was to dispose of the vast and varied materials which he collected by the way; but as the curve lessened, and the end appeared, it became obvious that all was to be efficient there.

Such were the rival orators, who sat glancing hostility and defiance at each other, during the early part of the session for 1823:—Brougham, as if wishing to overthrow the Secretary by a sweeping accusation of having abandoned all principle for the sake of office; and the Secretary ready to parry the charge, and attack in his turn. An opportunity at length offered; and it is the more worthy of being recorded, as being the last terrible personal attack previous to that change in the measures of the cabinet, which, though it had been begun from the moment that Canning, Robinson, and Huskinson came into office, was not at that time perceived, or at least admitted and appreciated. Upon that occasion, the oration of Brougham was, at the outset, disjointed and ragged, and apparently without aim or application. He careered over the whole annals of the world, and collected every instance in which genius had degraded itself at the footstool of power, or principle had been sacrificed for the vanity or the lucre of place; but still there was no allusion to Canning, and no connection that ordinary men could discover with the business before the House. When, however, he had collected every material which suited his purpose,—when the mass had become big and black, he bound it about and about with the cords of illustration and of argument; when its union was secure, he swung it round and round with the strength of a giant, and the rapidity of a whirlwind, in order that its impetus and its effects might be the more tremendous; and, while doing this, he ever and anon glared his eye, and pointed his finger, to make the aim and the direction sure. Canning himself was the first that seemed to be aware where and how terrible was to be the collision; and he kept writhing his body in agony, and rolling his eyes in fear, as if anxious to find some shelter from the impending bolt. The House soon caught the impression, and every man in it was glancing fearfully, first toward the orator, and then towards the Secretary.

There was, save the voice of Brougham, which growled in that undertone of muttered thunder which is so fearfully audible, and of which no speaker of the day was fully master but himself, a silence as if the angel of retribution had been flaring in the faces of all parties the scroll of their personal and political sins. A pen, which one of the secretaries dropped upon the matting, was heard in the remotest part of the house; and the voting members, who often slept in the side galleries during the debate, started up as at the blast of a trumpet. The stiffness of Brougham's figure had vanished; his features seemed concentrated almost to a point; he glanced toward every part of the house in succession; and, sounding the death-knell of the Secretary's forbearance and prudence, with both his clenched hands upon the table, he hurled at him an accusation more dreadful in its gall, and more torturing in its effects, than ever had been hurled at mortal man within the same walls. The result was instantaneous—was electric. It was as when the thunder cloud descends upon giant peak—one flash—one peal—the sublimity vanished, and all that remained was a small and cold pattering of rain. Canning started to his feet, and was able only to utter the unguarded words, "It is false!" to which followed a dull chapter of apologies. From that moment the House became more a scene of real business than of airy display and angry vituperation.*

In another sketch, entitled "St. Stephens," the same writer gives a scene where more justice is done to Canning, rising after one of Brougham's fierce onslaughts. Brougham is described as "dropping upon his seat exhausted, giving the House time to cheer, and leaving you confounded":—

While you are wondering what can come after this, and in your wonder glance your eye to the other side of the Speaker's chair, you perceive a figure somewhat obese, but exceedingly elegant and prepossessing, beaming like the sun from under the dark cloud which has so astounded with its thunders and pierced by its lightning. If you be an admirer of fine heads, you lose the first sentence of the right honourable Secretary, in scanning his appearance; but you are soon compelled to listen to him, and the more so perhaps that his matter and manner are so very unlike those of him, the edge of whose eloquence the Secretary has to turn. You can perceive by the glance which he sends across, a manly admiration of the powers of his antagonist, and perchance the expression of a lingering wish somewhat analogous to "would he were one of us!" But the smitten small ones have gathered themselves under the wing of the protecting hen, and therefore he must exert himself and drive away the kite. He does it, however, not so much by disproving what has been advanced, or bringing discredit upon the averments of his opponent, as by winning your admiration of himself. What he utters is so elegant in its form, and so bespangled with wit, that you care not much, and indeed have no time to care, for the material of which it is made. Whatever be your political opinions, you are pleased to escape from the agony which you feel the invective of Brougham must have occasioned; and if your watchfulness of yourself be not all the closer, you detect a

* "Attic Fragments," 1825. Mr. Jerdan, author of "Men I Have Known," has some interesting personal reminiscences of Canning and Brougham, illustrating their rivalry at this period. On one occasion Mr. Canning asked Mr. Jerdan to be present in the House, as he was going to speak. At night returning together to Brompton, where they were neighbours, Mr. Jerdan asked why he had not spoken. "I did not give Brougham opportunity for reply," said Mr. Canning; "I was not afraid of him, but didn't want to let him have the last word."

voluntary "Hear" stealing out of your own lips, while the reiterated cheers of the House follow the eloquence of the Secretary.

A CHAPTER OF UNNATURAL HISTORY.

I HAVE always been fond of animals, and have from my youth up made them my companions as much as possible, treating them not merely with humanity—every man who is a man does that—but with kindness and as much indulgence as was good for them. Perhaps I have gone too far in that way at times, seeing that I must confess to having released an imprisoned mouse now and then from Betty's trap, when she was out of the way, and giving the poor sleek little captive one more chance. I have not been without my return for gentleness towards living things—for, by a kind of instinct for which I cannot account, all animals take kindly to me, and most of the domestic pets of friends and acquaintances will not only come at my call, but without calling, generally making up to me if they can, as if to claim a caress. Of course I have dabbled in natural history (as who has not that loves his four-footed, his feathered, or his finny fellow-creatures?) and found it an interesting study. But latterly my researches in this direction have led me out of the beaten track, and in consequence my ideas of the animal kingdom have suffered a shock which has unsettled them somewhat, and set me a pondering over the systems and theories of the naturalists, not without misgivings as to the value and truthfulness of their darling science. The reader must be informed that I have discovered in a work of undoubted authority not only several new races of animals which are not down in the compendiums of Mr. Rymer Jones, or the all-embracing catalogues of Baron Cuvier; but also counterparts of many of the old and well-known races, which are addicted to habits and modes of living differing altogether from anything and everything related concerning them by their scientific biographers, and quite opposed, moreover, to the doings of such of their brethren and congeners as our daily experience makes us familiar with.

I shall say something here, first, concerning some of the novelties which have puzzled me—of those strange creatures, I mean, never met with in books or in museums or collections of any kind; and then I shall conclude with some remarks on the singular perversities of habit characterising those better-known animals with which most of us are more or less acquainted.

The first specimen I shall introduce to the reader's notice is called the Wyvern. What, in the language of science, is his normal habitat (which means, Where does he live when he is at home?) I have not yet been able to discover. He is a most singular-looking fellow, having the head of an hound—and a very hungry-looking hound too—the body of a bird, and the legs and claws of a bird of prey. He has formidable wings, too; but they are not the wings of a bird or bat—they rather resemble the spiky back fin of a monster perch, horrent with lacerating weapons on the upper ridge, and stiff and strong with a bony frame-work all featherless and ghastly to look at. His breast bears shining scales instead of feathers, and his back is armour-plated like the sides of a man-of-war of the last Admiralty pattern. His tail is a standing wonder, being longer than his whole body and armed at the end with a ferocious-looking barb; its terrors are, however, somewhat mitigated by its being gracefully curled and looped inward, as if waiting to be tucked out of sight under the wing when

that member closes. What this rather alarming creature feeds on is nowhere stated, so far as I can find: my authority, which is very sparing, and still more mysterious in matters of detail, says something about "cross-lets fitchee"—if crosslets is another name for pikelets, then the food of the Wyvern may be a kind of a muffin and is of course farinaceous; but this is only a guess, and certainly is not corroborated by the presence of the formidable incisors seen in the creature's expanded jaws.

The next I shall mention is the Griffin. This is even a more uncouth-looking specimen than the Wyvern, to which at a casual view it bears some general resemblance. The head, however, is clearly that of a bird of prey; the fierce eye of the vulture flashes down over the curved beak of the eagle, and above them both bristles an angry-looking crest of stiffish feathers. A huge pair of wings—their "mighty pens" erect—spring from his shoulders and seem to lift him from the ground: his forefeet terminate in fearful claws, like those of the vulture. Below the breast his form is that of the tiger, and the feet are a tiger's feet. Add to this, that he wears a pair of longish ears cocked in that knowing way which is the delight of Whitechapel dog-fanciers—and that he carries his extensive mouth open and thrusts out his long undulating tongue for an airing—and you have a tolerably good notion of the Griffin.

The Pegasus comes next. I had imagined hitherto that this was a fabulous animal, typical of the lofty and untiring flights of the epic muse; but I must have been mistaken. Here he is in the flesh, the identical winged horse as painters have drawn and sculptors chiselled him. What is remarkable about him is, that though he is repeatedly brought forward by my authority with his wings grandly outspread and fanning the air, he yet does not fly, but insists on standing still on his hind legs, while he seems to be feeling about with his fore feet for something shut up in a kind of box. On mentioning this peculiarity to my friend Mr. R. Jones, that accomplished naturalist tells me it is quite right—that Pegasus does not fly now-a-days, it being quite as much as he can do to get upon his hind legs; and that what he is feeling about for is probably the cash, of which just now he is sadly in want.

The next specimen is called the Sea Lion. He is a lion to all appearance as to his head and mane and fore legs and feet; but below the waist he is indubitably a fish, and is covered with big scales from the breast right down to the tail; the tail, however, does not finish off with the ordinary piscine appendage to that member, but with a composite bunch of something not unlike the Pope's-head of the housemaid, and intended, it may be imagined, to sweep the cobwebs from the sea-caves.

There are several samples of the Dragon and the demi-Dragon: some of them have the terrible heads and jaws of the pre-Adamite lizards, while others are content with the rounded beak of the parrot. That a good many of them are given to vomiting fire, does not say much for the pleasure of their company. Whether this peculiarity may be accounted for by the nature of their food—which, for ought I know, may be Wallsend washed down with paraffin—I must leave others to determine. The dragon is always rampant and bent on mischief to somebody, but the demi-dragon, albeit evidently a chip of the old block, is seen nestling in the cup of a flower, his fiery eye and fateful jaw showing in grim contrast to the tender calyx.

The last which I shall mention of these strange unaccountable creatures is the Cockatrice. The body of this fellow is neither that of bird nor dragon, but a kind of mixture of the two, being what is called "wattled" in

front and armour-plated at the back; he has a pair of vampire wings springing, not from his shoulders, but from the centre of his plump paunch. His head resembles that of the dunghill cock in the act of uttering a challenge, and he carries his crest erect, while his ample gills hang down and serve as a defence to the throat. But his tail—as the Yankees say, his tail is a caution; longer by far than the rest of his body; it is too extensive to be displayed *in toto*, as, were it fully drawn out, it must gravitate in an unseemly dragging manner towards the ground; it is, therefore, tied in a knot—or rather, I presume, it ties itself; for, *horresco referens*, the tail of the cockatrice is a separate entity, doing business on its own account, and *terminating in a head*, to all appearance the head of a serpent, with widely gaping mouth and protruding poison-fangs, “willing to wound,” and not by any means “afraid to strike.” I confess this terrible specimen puzzles me most of all, and all my attempts at classifying him have proved abortive. According to the received systems the bird end ought to swallow up the serpent end, or the serpent end the bird end; though it is not at all easy to see how either could manage the business, and if it were managed there would be nothing left, a consummation which would, at any rate, save me the trouble of classifying the cockatrice.

Now as to the other animals which my authority treats of, the common *feræ naturæ*, their singularity consists not in their conformation, with which most people are familiar, but in the strange habits and antics attributed to them. I cannot, from want of space, describe them all, but enough of them may be briefly cited to satisfy the reader. Among the wild animals are elephants, lions, tigers, wolves, bears, antelopes, stags, lynxes, porcupines, foxes, and wild boars, not to mention hogs and pigs and piglings innumerable, long-tailed, short-tailed, and curly-tailed. Concerning all these denizens of the forest the most remarkable thing is the unanimity that reigns among them in regard to one particular matter; what I mean is, that, with an occasional exception in favour of the pigs and piglings, one and all of them stand on their hind legs. Whatever else they may do, they are sure to do that; with their fore-feet and paws they may push against some shield or hatchment, they may grasp as they best can a dagger or a battle-axe, or flourish their tails aloft and expand their nostrils as if eager for the fight; but under any circumstances they decline to settle down on all-fours, so that I am forced to conclude that the position which is natural to their congeners is foreign to them. With regard to some of them there are certain cabalistic expressions used which it is possible, if one could get at their signification, would throw some light on their history. Thus, concerning a leopard with spots on his body as big as pancakes, it is gravely stated that he is “countercompony of the first and second.” If the reader can solve the mystery involved in that expression he is a much cleverer fellow than I am, and I shall be glad to receive a communication from him on the subject, which communication he may address to me under cover to the editor. Again, a porcupine pousetting, who has had his quills combed down smooth and sleek as the glossy hair of a Sunday-morning school girl, is described as “gyronny of eight,” which expression is also too crabbed for my powers of penetration. A lion, who seems to stand ill at ease, as though on one leg rather than two, presents an enigma somewhat less difficult; concerning him it is said, “lion’s gamb erased in bend within a boudure,” by which I understand some accident or other to the animal’s leg; *gamb* means leg, of course, and the

erasure, which must be an injury of some kind, may have been consequent on the brute’s having put his foot into chancery somehow or other, as seems to me to be intimated by the term “within a boudure.” In the case of one of the lynxes I find the expressions made use of to describe him, or it may be something belonging to him, are “a bend cotised sa,” the purport and propriety of which, I am sorry to say, I am not lynx-eyed enough to discover.

With regard to the domestic animals and the birds, it may be said that although they are not so universally given to standing in unnatural positions, they yet sometimes behave in a manner not at all to be expected of them, and quite opposed to the habits attributed to them by the naturalists. Thus dogs and horses go about bedizened with stars and crosses; owls stand on one leg and with staring eyes look out on mankind in broad day. Swans make their nests in coronets, and pelicans do the same. Goats and lambs are not afraid of wolves and tigers, but take part in the same occupations with them, each lending a helping paw to the other. There is no explanation given of these irregularities of conduct, unless what may be shut up in such strange terms as “chequy, or, a fesse,” “vert, gules, armed and langued,” “cross patée fitchée,” etc., etc., all of which are about as intelligible to me as the Chippewaw Indian’s dialect. I thought I had some glimpse of a meaning in one instance where it is stated, in reference to some deer, that they were “ducally gouged,” imagining for a moment that they might have been cooked, served up at table, and swallowed by a duke; but I was disabused of that notion when I found that unclean animals were also ducally gouged, and I discovered afterwards that to be ducally gouged is to wear a duke’s gougel, or armour for the throat.

The birds in the list comprise the largest and strongest, such as the eagle, vulture, stork, ostrich, pelican, hawk, falcon, swan, heron and raven; but though they all take evident delight in making a grand display of wings and legs, and covering as much space as possible, they never by any chance mount into the air and try their powers of flight. The reason of this we cannot say, and if we are told that it is because they are “colised sa in a bend,” we are no wiser than we were before. When an eagle soars aloft above the clouds, or a swan sails the stream majestically, we know what to make of them; but when the royal bird scowls at us through something very like a horse-collar, or a swan sits hatching her cygnets in a coronet, or when an ostrich goes strutting about with the key of the cellar in his mouth, we are completely abroad. It is no use to tell us, in such anomalous cases, that the creatures are engrailed, or gyronny, or escalloped, or nowed, or fitchettée, we want some simpler explanation in terms “understanded of the common people.”

All the animals noticed above, and indeed a good many which have not been mentioned, are the pets and darlings of the English aristocracy, and are held in the highest estimation by people of *bon ton*. What use is made of the creatures is not very clear, nor is it apparent how their accommodation is provided for in the town or country residences of the nobility and gentry. The only knowledge we can arrive at concerning them, beyond what is set down above, is, that wherever they are they are thoroughly well guarded and shut up from the prying eyes of the curious public. I should have known nothing of them myself, with all my regard for living creatures, if it had not been for Mr. Ulster, of the King’s Arms, who has published a big red book about them, which book accidentally fell in my way.

Varieties.

LEEDS ART EXHIBITION.—Comparison with the Manchester Exhibition of Art Treasures in 1857 is hardly fair, either as regards the works shown or the conditions of display. The mere priority of the Manchester Exhibition gave it a vast advantage. It was the first great art exhibition in England, and the example set by the northern manufacturing capital has since been followed both in the metropolis and the provinces, and abroad as well as at home, till the possessors of masterpieces have become wearied of the often-renewed demand upon their galleries, some of them from unwillingness to deprive themselves of the enjoyment of their choicest treasures for long periods, others from apprehensions of injury to their pictures not altogether unjustified. Again, the art treasures at Manchester were arranged in a building constructed expressly for their display, and so successfully planned as to have settled decisively some of the most difficult questions connected with the hanging and lighting of pictures. In Leeds the pictures are displayed in the wards and corridors of a permanent building, erected for an infirmary, the special conditions of which are in the all-important particular of lighting, about as ill-adapted as possible for pictures. After making fair allowance for both these drawbacks, our conclusion is that the organizers of the Leeds Exhibition deserve credit for having got together a collection only second as a whole in interest, extent, and variety to that of Manchester, in some departments equal, in some superior, to that wonderful gathering of treasures of fine and ornamental art.—*Times*.

HOSPITAL CARRIAGES.—Special conveyances are at length being provided for patients taken to the Fever and Small-pox hospitals. The use of common cabs for this purpose has been a frequent cause of spreading infection. The public are indebted to Dr. Horace Jeaffreson and the Committee of the Hospital Carriage Fund for their exertions in this matter. But the evil will not be diminished till the provisions of the Public Health Act of 1866 are stringently carried out, by which heavy penalties are attached to the conveyance of persons suffering from infectious diseases in ordinary street cabs. The vestries of the Metropolitan districts are required by the same Act to provide hospital ambulances.

THE CAPTURE OF MAGDALA.—Lieutenant Stumm, the correspondent of the *Cologne Gazette* in Abyssinia, thus describes the taking of Magdala:—"About nine o'clock on the morning of the 13th of April the 'storming companies,' as they triumphantly called themselves, began to advance, and after an hour and a quarter's difficult climbing we reached the ridge which connects Fala with Selassieh. We suddenly found ourselves, without meeting the slightest resistance, in the midst of Theodore's camp, surrounded by thousands of men, women, and children, who have been living here for months in the innumerable straw huts which cover the plateaux and rocks. Eleven chiefs, with 1,500 men, at once gave up their arms and hastened to show us the way to Magdala, which now for the first time, like an inaccessible eagle's nest, lay before our eyes. . . . Before the fortress is a level space about one English mile long, which connects Magdala with the two other hills, and here was the head-quarters of the Emperor. At our approach the inhabitants fled in all directions. Only at the foot of the fortress there was a body of horse, by whom a shot was fired at us from time to time. When our vanguard, consisting of forty cavalry, halted, four horsemen suddenly sprang forward from the side of the enemy. The first was distinguished by the shining metal ornaments on his shield and saddle, and when the brave warriors approached us the natives hurried, with cries of 'Negus! negus!' behind the rocks for shelter. It was the Emperor himself, who, with three companions, was performing his last military achievement, and encouraging his hesitating followers to fight. At a distance of 200 paces from us they halted, fired their guns, and galloped back as quickly as they had come. . . . Meanwhile Sir Robert Napier came up with the artillery. A reconnaissance was carefully begun, and about two our fire was opened on Magdala from four different points, chiefly in the direction of the western side of the fortress. The Armstrong guns, the conveyance of which had given so much trouble, came into use at last, though, doubtless owing to the unfavourable manner in which they were placed, they did not produce so much effect as the small mountain guns. When the fire had lasted two hours, and the smoke of the bursting shells became visible between the houses of

Magdala, the troops, with the 45th regiment in front, advanced to storm the place. The Emperor had succeeded, with only nineteen followers, in occupying us the whole day, and with them he defended the entrance to the fortress up to the last moment. I joined the storming column, which, protected by a steady fire of small arms, began to climb up the steep path. The gate, about five feet wide, was not penetrated by our fire, and there was no powder to blow it up. A company of soldiers found an entrance by climbing up the rocks on the right, while others tried to get over the thorn hedges with ladders. There was a desperate resistance, and ten of our men were wounded. The brave defenders of the gate were shot down by the troops as they climbed over, and the gate was then opened from the inside. A second gate was passed without resistance, and here we suddenly found ourselves before the body of the Emperor, who had just shot himself with a pistol. . . . We leave the body and hurry on, a dropping fire showing us that the resistance was not yet over. . . . We reach some large round huts, which are carefully covered with black cloths and skins. This was the Emperor's treasury. . . . Silvery and golden mitres, swords with richly jewelled handles, English guns, valuable vases, and utensils of every kind, photographs, silken stuffs, illustrated books, church ornaments, and even a case of champagne, lay here in the greatest confusion. . . . Our commander now appeared with numerous troops, and all congratulated him on the brilliant close of the expedition."

WHERE ARE HIS FRIENDS?—A lecture was lately delivered at Liverpool by the Rev. Dr. Littledale, who is reported to have described the leading English and Scotch Reformers as "a set of miscreants," and to have said "that Robespierre, Marat, St. Just, and Couthon, merit quite as much admiration and respect as Cranmer, Ridley, Latimer, and Hooper." He even apologised for ranking these heroes of the French Revolution with the Reformers, "as standing on a higher moral level than the base traitors who were deservedly executed by Mary I." This reminds us of the Spanish Jesuit Molina, who, referring to the falling off in pilgrimages to the shrine of St. Jago de Compostella after the Reformation, says, "the damned doctrines of the accursed Luther diminished the number of Germans and of wealthy English."

CALCRAFT, THE LAST PUBLIC HANGMAN.—In reply to some severe remarks in a morning paper, the following curious letter appeared:—"Sir,—Much has been said to prejudice the public mind against poor Calcrafft, whose only crime is that he is the minister of justice and the dread executor of the rigour of the law. I happen to know the man, as the minister of the church in which he worships, and a more worthy creature does not exist. To stigmatise him as a hardhearted, cruel, low-lived, crawling, crouching, fawning wretch, which some of the papers, in connection with his duty as public executioner, have done, is utterly wide of the fact. He is a good and tender-hearted man, an habitual frequenter of a Church of England place of worship, where his white head and venerable appearance is pleasingly conspicuous, though his identity is not generally known among the congregation. The execution of his duty is no pleasing topic of conversation with him; he takes no delight in gratifying curiosity by enlarging on the dismal scenes in which he takes so necessary a part; he is modest and unassuming. He is by trade a shoemaker, and you might deal with him all your life, and have no more idea that he was the common hangman than that he was the Grand Lama of Thibet. He is a very devout attendant upon public worship, and a man of very simple and straightforward mind, fulfilling all the relations of domestic and social life in a kindly and affectionate manner. Calcrafft is no monster, and no one, I am persuaded, will be better pleased than he, that he has no longer to perform his unenviable duty in the face of an excited and oftentimes exasperated mob." The last execution in public was that of Michael Barrett, the Fenian conspirator, engaged in the Clerkenwell outrage.

SPANIARDS DESCRIBED BY THE DUKE OF WELLINGTON.—Spain at the end was as helpless as she had been at the beginning, and all through the war, and quite unequal to her own deliverance either by arms or policy. It is impossible to imagine the ignorance and incapacity, the vanity, cowardice, hopeless imbecility, insane arrogance, and restless, intriguing, false and treacherous spirit of our Peninsula allies.—*Wellington's Despatches*.

DRIFTING ASHORE.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER VI.

HASSALL had left me his telescope. I could see the people on board the wreck stretching out their hands towards the boat as she left the shore on her errand of mercy. Mason every now and then asked for the glass and looked towards the wreck. He seemed more and more convinced that the lady on board was his wife. Yet could he do nothing? Yes, he could. Though he could not exert his body I saw that he was doing all that man in his utmost extremity can do. His lips

were moving, his head was bent forward, his eyes glancing at times at the boat and the ship, his hands were clasped tightly in prayer, forgetful of the crowds surrounding him. The boat, impelled by lusty strokes, darted on. She reached the wreck. The lady was lifted in. No one seemed inclined to follow. The danger was fearful. Not before, since she struck, had one of the huge rollers failed at much shorter intervals to dash over and over the ship. Should one of them overtake the boat her fate would be sealed. On came the boat towards the beach. A number of seamen rushed down into the surf to receive her and haul her

up as soon as she should touch the sand. The excitement among the crowd was tremendous. Far off I saw one of these huge billows rushing onwards. If it broke before the boat could reach the beach it would overwhelm her. The least excited of the crowd, to all appearance, was my friend Captain Mason. He advanced slowly towards the spot which it seemed probable the boat would reach, then he stopped for a moment. On she came, her keel grated on the sand, sturdy shoulders bore her along upwards, and ere the coming roller burst she was safe beyond its reach. The lady lay almost overcome in the stern sheets. Mason uttered his wife's name, she looked up, and in another moment she was placed in his arms. A communication was afterwards established between the wreck and the shore, and most of the crew landed before the gale again came down with redoubled fury. By the morning scarce a vestige of the ship remained. I had the pleasure of seeing Mrs. Mason completely recovered two days afterwards, and thankful for her providential escape.

My brother William got leave of absence for three or four days, and he was anxious to spend the time in a cruise along the coast, and to get me to accompany him. I had wound up my mercantile business at the place, but as the Barbara would be detained a few days longer to complete her repairs, in a weak moment I consented to his proposal, as if we had not enough knocking about on salt water in the pursuit of our professional duties. It is difficult to put old heads on young shoulders. We did not remember that it was still the stormy season, and that the natives might not be so inclined to be civil to us, their late conquerors, coming in a half-decked boat with fowling-pieces, as they would had we appeared under the protection of the frigate's guns.

We agreed that it would be as well to have companions. I asked O'Carroll, who was very ready to come, and William brought a friend, whom he introduced as "My messmate, Toby Trundle." His name was a curious one—at first I did not suppose that it was anything but a nickname—and he himself was one of the oddest little fellows I ever met. From the first glance I had of him, I fancied that he was rather a young companion for my brother, but a second look showed me that he was fully his age. We had hired a craft, a schooner-rigged, half-decked boat, about five-and-twenty feet long, with a well aft in which we could sit comfortably enough. She was not a bad boat for smooth water, but if caught in a heavy sea, very likely to drown all on board.

Our crew consisted of a Frenchman, Paul Jacotot, the owner of the *Doré*, as our craft was called, his son Auguste, a boy of thirteen, and Jack Nobs, a boy I brought from the *Barbara*. The Frenchman was to act as pilot and cook. The boys were to scrape the potatoes—or rather prepare the yams, for we had none of the former root—and tend the head-sheets. A boatswain's mate, Sam Kelson, who had been in hospital, had been allowed to accompany the midshipmen before returning on board. The two midshipmen were to act as officers. O'Carroll, who they did not know was a sailor, and I, were to be passengers, and the rest of the party were rated as crew. We had laid in all sorts of provisions, an ample supply for the few days we were to be away. Port Louis, it must be remembered, is on the north side of the island, and we had agreed to make our cruise to the eastward, where there are some small islands—Gunners Coin and Flat Island. If the wind should prove favourable we hoped to circumnavigate the island. With a fair breeze off the land, and Le Ponce seen standing up astern beyond the town, we sailed out of the harbour, the weather being as fine as heart could

desire. William and Toby Trundle took it by turns to steer, Jacotot pointing out the dangers to be avoided, for we kept close in shore for the sake of the scenery. Toby Trundle sat perched up aft steering, with a cigar in his mouth, looking, in a broad-brimmed straw hat, a white jacket and trousers, contrasting with his sun-burnt complexion, more like a monkey than a midshipman. Jacotot, when not engaged in any culinary matter below, was jabbering away at a rapid rate to us, if we would listen; if not, he was addressing his son, whom he kept constantly on the move, now scolding, now praising with terms of tender endearment. The moment he had done one thing he called him to do another, and frequently two or three things at a time. Fortunately for Auguste, he was of an active, volatile disposition, or he would have had an uneasy life of it.

We enjoyed ourselves, and lunched and dined with great contentment, voting Jacotot a first-rate *chef*, which he undoubtedly was. He was, however, a better cook than seaman we before long discovered. "The next prize we take I hope that we shall find some cooks on board; we must secure one for our mess," observed Toby, helping himself to one of the dishes Jacotot had sent aft. I had not been long on board before I found out, what seemed to have escaped the midshipmen's observation when they hired the boat, that the rigging was sadly rotten, and that she herself was in a somewhat leaky condition. They, however, only laughed at the leaking: "It will keep the boat sweet, and give Jack Nobs and Auguste something to do," observed Master Trundle, cocking his eye at me. Notwithstanding this, we stood on, the breeze shifting conveniently in our favour till nightfall, when we put into a small harbour, the entrance to which our pilot for a wonder knew. The next day we continued our course, landing in a bay, up which we ran to have a look at the country, and to get some goat's milk and fruit. We found a small farm, the only white people being an old-fashioned Frenchman, with a somewhat dingy wife, and two grown-up daughters. All the rest of the people were either brown Orientals or black Africans. The old Frenchman was very civil, merely shrugged his shoulders when he saw our flag, and observed that it was the fortune of war, and that, as we were the most numerous, France had lost no honour, though she lost the dependency. He supplied us for a trifle with a bottle of goat's milk, and as many melons, pines, and mangoes as we could manage to eat. He politely assisted in taking them down to the boat. As he did so he looked round the horizon seaward, and up at the sky. "Messieurs will do well to remain at anchor for a few hours longer," he observed. "We are going to have a change of weather. It may be slight, or it may be very great, and you will be more content on shore than at sea." We thanked him for his advice, but the midshipmen, asserting that if we stopped they might not be able to rejoin their ship at the right time, it was disregarded. On standing out again, however, we saw that the hope of getting round the island was vain, and that our surest course would be to return by the way we had come. The weather soon changed; ugly black clouds collected and came sweeping up from the west and south, though as yet but little wind filled our sails.

"I am afraid that we are going to have a storm," I observed.

"Oh, no fear; I don't think that there will be anything in it," answered Toby Trundle.

"I think that there'll be a great deal in it, and I would advise you gentlemen to make the best of your way back to the bay we have just left," said O'Carroll.

The midshipmen looked at him as much as to say, "What do you know about the matter?" Jacotot was too busy cooking an omelette to attend to the weather, or he should have warned us. The question was settled by a sudden gust which came off the land, and laid the boat on her beam-ends. I thought we were going to capsize, and so we should, but crack away went both our masts, and the boat righted, one-third full of water. We all looked at each other for a moment aghast. It was a mercy that no one was washed overboard. A second and stronger gust followed the first, and on drove the boat helplessly before it. "You'll pump and bale out the water, and get on board the wreck of the masts," said O'Carroll, quietly. We followed his advice, as best we could. Jacotot, who was attending to his little cooking-stove below, when the squall struck us, popped up his head with his white nightcap on, his countenance so ludicrously expressive of dismay that, in spite of the danger we were in, Trundle burst into a fit of laughter. The Frenchman had not time to get out before the vessel righted. He now emerged completely, and frantically seizing his cap, tore it off his head, and threw it into the boiling water. He then joined in hauling on board the wreck of the rigging. "If we are to save our lives, we must forthwith rig a juremast, so as to keep the boat before the gale," observed O'Carroll. With the aid of a wood-axe we knocked out the stump of the foremast, and, making a fresh heel to the broken spar, managed, in spite of the rolling of the boat, to slip it into its place. This was done not a moment too soon: the wind increased so rapidly, and blew with such fearful violence, that we should have been unable to accomplish the task, though as yet there was not much sea. O'Carroll showed that he was a man for an emergency. "This will be more than a gale," he observed; "it will be a regular hurricane—we may expect that; but still, if we manage properly, we may save our lives." Close-reefing the foresail, we got it ready to hoist as a square sail; the rest of the spars we lashed fore and aft on either side, while we cut up the mainsail and raised the gunwale a foot or more all round to help keep out the water. We also, as far as we could, covered in the after-part of the little craft. While we were thus engaged, the boys were pumping and baling. This task was scarcely accomplished before the wind had blown us helplessly so far off the land that we became exposed to the full violence of the sea, which had rapidly risen. The water was leaping on every side tumultuously—the foam flying in thick masses off it—each sea, as it rose high above our heads, threatening to overwhelm us.

We gazed wistfully at the land which we had so unwisely left, but we had no power of returning there. Our only prospect of passing amidst the heavy seas now rolling around us, was to hoist our sail and scud before the wind wherever it might drive us. O'Carroll now took the helm. "I have had more experience in these seas than you, young gentlemen, and the slightest want of care may send such a craft as this to the bottom," he observed. Without a word, they set to work to pump and bale. Even Trundle grew serious. Jacotot every now and then stopped pumping or baling, or whatever he was about, and pulled his hair, and made a hideous face, scolded Auguste, telling him to *depechez vites*, and then set to work himself harder than ever. The English seaman worked away without saying a word beyond what was absolutely necessary. Jack Nobs behaved very well, but cried in sympathy when Auguste was scolded. The latter always blubbered on till his father ceased speaking. I could not help remarking what I have described, notwithstanding the

fearful danger we were running. The sky was of an almost inky hue, while the sea was of the colour of lead frosted over with the driving spray torn off from the summits of the tossing seas by the fury of the wind. Our stump of a mast, as well as our sail, had been well secured, though I dreaded every instant to see the ring-bolts, to which the ropes had been made fast, dragged out of the sides, and the rotten boat torn to pieces. Thus on we flew right into the Indian Ocean, though in what direction we could only guess, for our compass, like everything belonging to the craft, was defective. Intending only to make a coasting trip, we had no chart, except one of the island from which we were now being driven rapidly away. To be in a gale of wind, on board a stout ship in the open sea, is a fine thing once in one's life; but to have to sit in a rotten boat, with a hurricane driving her, one knows not where, across the ocean, is a very different matter. Our only prospect of saving our lives, humanly speaking, was to keep the boat dead before the wind,—a moment's careless steering might have caused our destruction.

We were all so busy in pumping or baling that we had no time to watch each other's countenances, or we might have seen alarm and anxiety depicted on them as the rising seas came following up astern, threatening to engulf us. I felt for the young brother who was with me, so lighthearted and merry, and yet so little prepared for the eternity into which any moment we might be plunged. After fervent inward prayer, my own mind was comforted, so much so that I was able to speak earnest words, not only to my young brother, but to the others. Trundle and Jack looked very serious, but rather bewildered, as if they could not comprehend what was said. Such is, I fear, too often the case under such circumstances. I remembered how, a few days before, I had seen Mason praying at a time of the utmost extremity, and I urged my companions to pray for themselves. Jacotot was the only person who seemed averse to listen to the word of truth. Though he had raged and pulled his hair with grief at the injury done to his vessel, he could not bring himself to care for anything beyond the passing moment. But while the rest grew calm and resigned, he became more and more agitated and alarmed. In each sea which rolled up after us in the distance he saw the messenger which was to summon him to destruction. Poor little Auguste could only cry with fear of the undefined. He had never been taught to believe in anything, and thus he could not even believe in the reality of death till he was in its grasp. O'Carroll was nominally a Romanist, but I had reason to hope from a remark he made, that he knew where alone to look for safety. No idle cry to Virgin or saint came from his lips.

Under the circumstances in which we were placed, people can talk but little, though the thoughts crowd through the mind with frightful rapidity. Unless when occupied, we for most of the time sat silent, watching the ocean. Night was coming on and the fury of the tempest had in no way decreased. It was difficult to steer in the day time—it was doubly difficult and dangerous at night. After O'Carroll had been steering for some time, Trundle begged that he might again take the helm.

"Trust me," he said, "I have been in a gale of wind in an open boat before now, and know how to steer carefully."

"But you've not steered in a hurricane in the Indian seas, Mr. Trundle," answered O'Carroll. "Any moment the wind may shift round, and if we were to be taken aback, it would be all over with us. As long as I can

keep my eyes open I'll stay where I am, if you please." And O'Carroll was as good as his word: hour after hour he sat there, as we rushed on up and down the watery hills through the pitchy darkness—it was indeed a long, long night. Though we had eaten nothing since the hurricane came on, we were all of us rather weary than hungry. As for sleepiness, that was very far from any one. When compelled to rest, we could employ our thoughts in little else than wishing for daylight, and hoping that the storm would soon cease. It was a relief to be called on to pump or bale, for the increasing leaks required three of us at a time to be actively engaged in both operations. But I am wrong in saying that I could think of nothing except my own fearful peril. Frequently I thought of my dear mother and other loved ones at home. The thought gave me comfort and courage, and cheered me up through the horrors of the night. Daylight came at last, and revealed the tumultuous ocean on every side, but not a speck of land was visible. Trundle was the first to exclaim that he was hungry; but to light a fire was almost impossible, and even Jacotot could not have cooked by it had it been lighted. We managed, however, to serve out some bread and the old Frenchman's fruit to all hands, and then we had to turn to and clear the craft of water, which was finding its way in through every seam. It seemed scarcely possible that she could float much longer, should the hurricane continue, with the violent working to which we were exposed. Had we been stationary, the tempest would have passed over us; but driven along with it, we had for a much longer time to endure its fury. It seemed, indeed, surprising that the boat should have floated so long. As far as we depended, indeed, on our own exertions, the most careful steering could alone have saved us. We had been longing for daylight; now that it had come, the dangers of our condition appeared more evident, and we almost wished again for night. We could not calculate, either, in what direction we were being driven, but we feared it might be where rocks and coral banks and islets abound, and that at any moment we might be hurled on one of them. O'Carroll still sat at his post. I asked if he did not feel tired. "May be, but till the gale is over, here I'll stick," he answered. "And sure it's as pretty a sample of a hurricane as any of you'll be after wishing to see for many a day to come."

At length, towards noon, the wind began to fall, and in a very short time, though it still blew hard, and the sea ran almost as high as before, and was consequently as dangerous, it was evident that the hurricane was over. Our hopes revived. Still we were obliged to run on before the wind; and to avoid the danger of being pooped by the quickly-following sea, we had to hoist more of our sail: indeed, we now dreaded not having wind enough to avoid the sea. Thus passed the day, and before nightfall we were rolling on a tolerably smooth swell with a moderate breeze. Still we had to exert ourselves as before to keep the boat afloat. The moment, however, that one of us was relieved at the pump or baling bucket, he dropped off to sleep. I was afraid, indeed, at first, that we should all go to sleep together. Nothing, indeed, for some hours could rouse up the two boys. My young brother and Trundle were, however, after a short snooze, as lively as ever, and as merry too. Midshipmen-like, they did not seem to trouble themselves about the future. I, however, still felt very anxious about it. The Southern Cross and many another bright constellation not long familiar to my eyes were shining forth in the clear sky. Had we

known our position, even though we had no compass, we might have shaped a course for the Mauritius. We calculated that we had been driven two hundred miles away from it in the direction of the equator. Should we steer south we were as likely to miss as to find it. We proposed, therefore, to steer to the west, knowing that we must thus reach some part of the coast of Madagascar, where the English had at that time a fort and a garrison. "But we must have our craft rigged before we talk of the course we'll steer," observed O'Carroll, who at that moment awoke from a long sleep. With the morning light we set to work to fit a mainmast, and to rig the boat as best we could. There was a light breeze, but as it was from the west we lay without any canvas set.

While all hands were busily employed fitting the rigging, I looked up and saw a brig under all sail approaching us at no great distance. Beyond her was another vessel, a ship—I pointed her out. O'Carroll took the telescope.

"She's an English vessel chased by an enemy," he observed. "She'll not stop to help us, so the closer we lie the better." He kept after this continually taking up the glass for some time, when suddenly he exclaimed, "As I'm an Irishman, it's that villain La Roche again."

His countenance fell as he spoke. He handed me the glass—I took a steady look at the ship and had little doubt that it was our old antagonist the Mignonne in sight.

AMONG THE OLD MASTERS.*

THE protracted wars which terminated with the Battle of Waterloo closed almost the whole continent of Europe against international communication. Especially had Englishmen been shut out from countries that were known only by report to almost the whole of one generation. But with the return of peace they rushed to the continent to visit the cities, towns, and plains which the records of the war had rendered famous, or to make the personal acquaintance of those places whose names are associated with the histories of past ages or with art in its various phases. The commercial spirit of our countrymen, long restrained within comparatively narrow limits by the belligerent state of Europe, was roused by degrees into unwonted activity, and as the wealth of England increased, so in proportion did the desire to possess those acquisitions which are considered to be the evidences of affluence and refined taste. Men who had visited the picture-galleries, both public and private, of France, Italy, Holland, and Belgium, were eager to emulate the owners of these, so far as their means would allow them, however little they knew of the value of pictures, and how incapable soever they were to estimate the true merits of art.

It is an axiom of trade and commerce that the supply of an article is generally regulated by the demand for it, and the remark has been found to apply to art-matters equally as to others. Artists have multiplied wonderfully during the last quarter of a century, or longer, because their works have been demanded; but at the time to which allusion has just been made, the British

* At one of the recent meetings of the British Association in the Midland Counties, there was an exhibition of pictures lent by the various proprietors in the district. The number of works by "the old masters" in that collection was astounding! Suffice it to say that the catalogue was not prepared by Mr. Scharf or Dr. Waagen. Having no wish to disturb the satisfaction of the rich manufacturers who think they possess such treasures of art, we do not refer in detail to that exhibition, but, as a warning to others, we allow one who is well known in art-circles to reveal some of the mysteries of picture-dealing.

School of Painting found comparatively little favour among collectors, the *prestige* of the "old masters" far outweighing any merits our own artists possessed. Hence arose the desire of acquiring specimens of those painters which Italy, Spain, France, and the Low Countries had produced in the sixteenth and seventeenth centuries, and the early part of the eighteenth century in particular. But genuine examples of Raffaele, Titian, Carlo Dolce, Rubens, Teniers, and other great painters, were not readily procurable; their owners, as a rule, kept them safely in their own galleries or cabinets, and so continental dealers employed artists to copy such original pictures as they could gain access to, and to imitate the style and subject where they could not copy.

To give new work all the appearance of old is not a difficult process to the initiated; age and "mellowness," to adopt an artistic term, are easily produced by submitting the face of the picture to the action of smoke and the application of stained varnishes; and even the new canvas, where such has been used, has been made to undergo such transformation as to defy the investigation of an inexperienced eye. The safest plan, however, and that most frequently adopted, was to employ old canvas; that is, canvas on which some miserable daub had been painted in years long gone by, over which the copyist painted another picture after one of the great masters.

Some idea may be formed of the extent of the traffic in foreign pictures when I state that from the year 1833 to 1850, both inclusive, more than 188,000 of these works were imported into England from various parts of the continent. This statement is made from the returns given by the Custom House authorities of pictures entered for the payment of duty. The average of these eighteen years gives about 10,400 annually brought into England.

One naturally inquires—"What was done with them all?" The majority found their way into the hands of dealers, and into those of auctioneers in large provincial towns, whence they finally found a resting-place, as "furniture pictures"—so the real *cognoscenti* termed them—in the houses of wealthy merchants and prosperous tradesmen. Not a few, however, "adorned" the galleries of noblemen and country gentlemen, under the impression that they possessed genuine specimens. In process of time, when the press had opened the eyes of the public to the impositions practised, and a taste for collecting English pictures had superseded that for the acquisition of "old masters," the owners of the latter discarded to a great extent their once coveted treasures, which were exported by thousands to America and the colonies of Great Britain. A Californian paper that came into my hands very recently, contained an advertisement of an exhibition opened there, among which figured conspicuously works by the most honoured names known in ancient art.

I have stated that a very large number of imported pictures get into the possession of dealers and auctioneers; there were many, however, which were purchased abroad by our travelling fellow-countrymen, who, aspiring to a knowledge of art and professing connoisseurship, were constantly on the look-out for bargains, with which the foreign dealer, who had learned in time to know what suited the taste of English amateurs, was able to supply them. I will relate an anecdote by way of illustration. A wealthy gentleman, who had expended thousands of pounds on the continent in the purchase of paintings, was showing his collection to an artist who had recently returned from Italy. Having examined together a considerable number of pictures, the eye of the painter

rested on a rich "old" canvas, much to the delight of his host, who exclaimed with glee, "Yes, you are quite right, that's a beautiful work; the gem of my collection." The artist continued his examination, and his companion observed, "I'm glad you like it; a most beautiful work." The painter bowed. "It is the best I have;" followed by another bow. "But what do you mean by this?" exclaimed the owner in some surprise. "I only thank you for the compliments you pay me," was the reply. "I painted that picture, and only wonder to find it here, and so well disguised. I left it with my landlady at Rome; and if you can get at the back of the canvas, you will find my name legibly in red paint at the top, on the right-hand corner." The countenance of the collector immediately fell; search was made at once for the signature, and it was found as described.

A young artist with whom I was acquainted some years ago, related to me a very similar incident. A nobleman well known in the art-world for his extensive picture gallery, conducted him through the rooms, and in so doing stopped before a canvas and expatiated on the merits of the work bearing the name of an old painter of high repute, and which his lordship said he had just bought of a dealer for a large sum. The young man uttered some commonplace eulogistic phrase, "for I was afraid to say much about it," he remarked, when relating the anecdote to me, "the fact being," he continued, "that I painted the picture for the very man who sold it to Lord —. He had the original in his own possession, and asked me to make a copy of it for himself; this copy he sold as the original, and the latter he retained, to dispose of, in all probability, to some other dupe, titled or untitled."

A case has been reported in the *Times* newspaper very recently, which shows the worthlessness of many a picture-gallery assumed to be of great value. An English merchant, named Gower, died lately at Marseilles, bequeathing his paintings, which numbered 400, and numerous assumed ancient bronzes, to the Corporation of Liverpool, on condition that a suitable building should be erected for their reception. But the merchants and wealthy traders of that great place of commerce have been made wise by bitter experience in matters relating to art; and, before committing themselves to the acceptance of the gift, they sent a competent deputation to examine the works, the result of which was the entire rejection of the whole as not worth the cost of removal to Liverpool. The average value set on each painting was less than five pounds; and the bronzes were pronounced to be modern imitations, of the most ordinary manufacture.

The enormous profits made by unprincipled dealers, when the trade of forgeries was at its zenith, require an illustration, as in the following. One of these gentlemen, who lived in good style, and kept his carriage and livery-servants, bought for £40 a good picture, by C. Decker, a clever Dutch landscape-painter, who lived in the seventeenth century, and whose style bore some resemblance to that of Jacob Ruysdael, one of the greatest landscape painters of the Low Countries. The dealer procured the assistance of an artist then in comparative obscurity, but whose works have since realised large prices, to "touch it up," and to introduce into it two figures copied from one of Ruysdael's pictures, whose monogram was inserted on the canvas instead of Decker's, which it had previously borne. The painting was then sold as an original of Ruysdael, to a friend of the late Lord Farnborough, and on his recommendation, for his lordship was a distinguished collector. The price paid by the purchaser for his acquisition was 480 guineas;

the abettor of the fraud receiving 12 guineas for his labour of retouching and altering.

The works of Canaletto, of Venice, have always been favourite pictures of English collectors. He lived, it is stated, some time in England, and died exactly a century ago, leaving behind an immense number of paintings, chiefly views in Venice and Rome, as the fruits of his industry. No collection, however small, was considered complete without a pair, at least, of Canalettos, and the demand for them was so extensive that to supply it was a difficulty not readily surmountable. It did not, however, prove beyond the reach of ingenuity. There was a house standing not many years since—it probably still exists—near the bridge at Richmond, which I and others who were acquainted with the secret knew as the “Canaletto Manufactory,” the name it had received from the initiated. There “Canalettos” were produced by hundreds, figuring in picture-sales for years all over the country.

Cuyp, the famous Dutch painter of cattle, is another whose works have always been coveted in England, and, consequently, have been extensively forged. An artist, who was much employed by a dealer in this kind of work, was waited upon by another dealer for the purpose of giving him a commission to copy some pictures of a different kind. On his entering the studio he noticed on an easel a beautiful little picture, an original by Cuyp, of some cattle in a meadow. “Will you sell me that picture?” inquires the visitor. “Which?” replied the painter, who at the moment was looking another way, and did not observe to which painting allusion had been made. “This, that stands on the easel.” “Oh, no,” was the rejoinder, “it does not belong to me; and, besides, I call that my ‘milch cow.’” “Milch cow! why, what do you mean? there are cows and a bull in it.” “Just so; yet it has proved my milch cow, for I have drawn abundant sustenance from it, and you will understand this when I tell you I have copied it and recopied it till I almost know it by heart.”

One of the most ingenious and remarkable instances of picture-forging I ever heard of was told me some years ago by a person on whose veracity I always placed the utmost dependence, and who was well known by dealers and restorers. A gentleman in Amsterdam was in possession of a valuable painting by one of the great Dutch masters. It had been in his family almost, if not altogether, from the time it had left the artist's studio; and the seals of its successive owners were affixed to the back of the panel on which it was painted. The picture had become much discoloured from age and accumulated dirt. The owner, though often pressed to submit it to the cleaning process, for a long time steadily refused to let it go out of his hands, as he had often heard of the tricks practised in the trade. He was at length persuaded by a dealer, who had considerable influence with him, and in whose honesty he had perfect faith, to send it to London for restoration. When this was effected, a picture was returned to the proprietor, who expressed himself perfectly satisfied with the improved appearance of the painting. About a year afterwards a gentleman from London was in Amsterdam, and, for some purpose or other, paid a visit to the Dutchman. While in conversation with him, his attention was arrested by the picture in question; and, addressing the owner, he remarked,—“Pardon me; you have a fine painting there: bought very recently in London, I presume?” “Oh, no; it has been in my family for more than a century and a-half.” “Impossible,” said the other, examining it attentively; “I have seen it more than once within the last few weeks at the house

of Mr. —, only it appears to be much brighter than when I saw it.” The Dutchman's suspicions were immediately aroused, and without delay he set on foot an inquiry into the whole matter, the result of which was the discovery that the painting returned to him was only a copy of his own. The fraud had been effected in the following manner. While the original was in the restorer's hands, he had it copied by a skilful artist. The next thing was to get over the difficulty of the sealed panel; this was accomplished by the aid of a clever mechanic, who neatly sawed off the painted surface of the old panel which he transferred to another for his employer, and fixed the copy to the sealed panel of the Amsterdam collector; who, recognising the heraldic bearings of the family as usual, had no idea of the deception practised on him. Of course, the “restorer” had to make “restoration,” and, to avoid public exposure, sent the copy without delay to the gentleman on whom he had imposed.

The rage in England for collecting “old masters” ceased comparatively about twenty years ago; and those who could afford to buy pictures sought for them in the works of British artists. It will naturally be assumed that frauds are not easily perpetrated in the country where the painters are living, or but recently deceased; yet forgeries of such kind are constantly finding their way into the market. Several living artists I could name whose works have been extensively copied, and the copies disposed of as originals. It happened that on two separate occasions which occur to me at this moment, I was present when two artists, both of them Royal Academicians, were asked to identify certain pictures as their own productions. In one case a water-colour drawing was submitted to the artist to whom it was attributed: he looked at it for some time very carefully, and then declared himself totally unable to determine its genuineness. The other instance was that of an oil picture of rather large dimensions; the subject historical. The painter, whose monogram was upon the work, examined it very closely, and decided that it was a true picture. The person in whose possession it was had great doubts as to its authenticity, and entreated the artist to give it further attention. After another careful scrutiny, he suddenly exclaimed, “No! it is not mine,” and pointing to a certain part of the costume of one of the figures, continued, “I never could have painted a bit of drapery in that style.”

The subject of picture-forgeries is one upon which I could dilate till, possibly, the reader would become wearied. The story of picture auctions, too, is one full of amusing incidents, though of worse than questionable commercial morality. Buyers of pictures should, to avoid counterfeits, either purchase from the various public galleries which are open annually with new works—that is, works not previously exhibited—or they should apply to the first-class dealers, of whom there are in London and elsewhere several whose names are a guarantee against imposition.

Sculpture, from the cost of material, and the difficulties attending its execution, is less exposed to frauds than painting; yet the records of art supply instances of such imitative productions, though not always with a dishonest intent. Michael Angelo is said to have executed, when about twenty-one years of age, for a gentleman of Milan, named Balthasar, a statue of Cupid, sculptured with such grace and finish that it was suggested it would readily pass for an antique, if a slight appearance of age were imparted to its surface. Balthasar, it is added by Vasari, the biographer of the

old Italian painters, who was Michael Angelo's contemporary, "acted on the hint, and then sent the statue to Rome, where it was sold as an antique work to the Cardinal Giorgio di Riario, who valued himself on his connoisseurship. His eminence had not long rejoiced in his acquisition, when rumours of the real truth became current; and, impelled by curiosity and mortified vanity, he employed an agent at Florence, where the sculptor resided, to see the reputed artist, and not only to inquire into the facts, but to ascertain, by an inspection of his works, whether he "was capable of producing so beautiful a figure."* The issue of the inquiry resulted in Michael Angelo being invited to Rome as the Cardinal's guest, especially when the latter found the sculptor had been no party to the fraud practised on him. This incident laid the foundation of Angelo's future fortunes.

At the commencement of the present year some of the Paris journals which take art into consideration, found materials for discussion in the subject of a bust, recently acquired by the French Government at a cost of £540, and now in the Louvre. It was presumed to be that of the Florentine poet, Benivieni, and executed in the fifteenth century, but by whom no one could even guess. The Italians claimed it as the work of one of their countrymen, the sculptor Bastianini, of Florence, who is still alive. He executed it, they allege, for a Signor Freppa, a dealer in antiquities and objects of *vertù*, who sold it to M. de Nolivos, through whom it passed into the hands of the French Government. The investigation into the matter which has been instituted, leaves the authenticity of the work still doubtful, though the French authorities will not, as might be expected, admit that they have been deceived in mistaking a modern work of art for one of ancient date.

The practice of artists, painters more especially, repeating their pictures is to be deprecated. It opens the door to fraud by throwing into the hands of the public duplicates, which after a time may be multiplied. And when it is known that an artist has produced more than one picture of the same subject, the difficulty of identification in the future is greatly increased.

THE MIDNIGHT SKY AT LONDON.

AUGUST.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

No one can view the heavens with the naked eye for any length of time, without noticing that the colour of the principal stars is not the same, but that many are white, or bluish white, some yellowish, and others red. These different tints arise most probably from the materials of which the envelopes, or photospheres, of the various stars are composed. If, however, we wish to examine this subject minutely, the telescopic observation of double stars will enable us to view, in the highest perfection, the brilliant contrasting colours exhibited by several of these interesting and popular objects. With the unassisted eye, the variation in colour of the brightest stars is very distinctly marked, especially in the white stars Sirius, Alpherat, Vega, Deneb, and Regulus; the yellow, or pale orange stars, Rigel, Procyon, Polaris, Kocab, and Altair; the orange-red Betelgeuse and Pollux; and the red stars Aldebaran, Antares, Arcturus, and Fomalhaut. The only colours mentioned by the ancients, whose experience in stellar observation was solely derived from unaided vision, were white and red. Some of these anciently-recorded

colours of the stars do not, however, agree with the colours of the same stars at the present day, which leads us to suppose that some physical change has taken place in the constitution of their external envelopes. We alluded in February to the probable change of the colour of Sirius from red to white since the days of Ptolemy, who also included Pollux and Betelgeuse among his list of fiery-red stars. The change of colour has, however, not been so decided in Pollux and Betelgeuse as in Sirius, for Pollux and Betelgeuse have still a rosy tint, although it is too faint to take them out of the class of orange-coloured objects. Mariotte, in 1686, in his treatise on "Colours," was the first person who made any mention of blue stars. He considered that the origin of blue stars was owing to "their freedom from exhalations as well as from their less intrinsic brightness." True blue single stars are not, however, common, but bluish white are plentiful enough. Mr. Dunlop, observer at the late Sir Thomas Brisbane's Observatory, Parramatta, New South Wales, noticed a stellar mass, in which every member was blue, and also a bluish nebula. Nothing of a similar kind has been seen in the northern hemisphere. But several of the components of the double stars are blue, and in a few cases both have a bluish tinge. Small stars of different colours are occasionally massed together in multiple stars, as in that beautiful stellar group near Kappa Crucis (the Southern Cross), in which are congregated more than a hundred stars of various colours, red, green, blue, and bluish green, giving the appearance, when viewed through a powerful telescope, of a superb collection of fancy jewellery.

But notwithstanding the brilliancy of colour in these magnificently variegated minute objects, scattered here and there in both hemispheres, the principal observations on the colour of stars have been made on the various tints exhibited by double stars, in which the colours are generally complementary. Usually, the larger star is of a yellow, or orange colour, and the smaller one green, or bluish white, but among these objects there is no shade of colour contained in the solar spectrum, which is not also represented in some one of these double stars. Admiral Smyth, in his "Sidereal Chromatics," has given a list of 109 double stars, with the colours of each pair, as observed by himself at two epochs, separated by several years, and also by M. Sestini, an Italian astronomer. The estimations in different years generally agree with each other, but in a few cases an actual change of colour has been suspected, especially in 95 Herculis, in which both components are of the fifth magnitude. The change in the colours of this double star is so very curious, that it may be interesting to record here the details of the observed variations in the colours of the two components, A and B, as exhibited by Professor C. P. Smyth. The observations were made by different observers between the years 1828 and 1862. In 1828 the component A was yellow; from that it passed to greyish, then successively to yellowish, with a blue tinge, greenish, light green, light apple green, "astonishing yellow green," and, finally, to yellow again. B in the same time passed from yellow to greyish, then successively to yellowish with a reddish tinge, reddish, cherry red, "egregious red," and, finally, to yellow again. It was the opinion of Admiral Smyth, whose experience was very great in this class of amateur astronomical work, that this star is a decided instance of sidereal colour-changing. It is proper, however, to remark that the Astronomer Royal has suggested, with good reason, that the simultaneous change in the colours

* Harford's "Life of Michael Angelo."

of the two stars is suspicious, and he considers that these apparent changes might have arisen by using different telescopes. Other stars viewed with the same telescopes as 95 Herculis, however, exhibited no sensible change. From Admiral Smyth's latest observations we give two or three examples of the complementary colours. In Eta Cassiopeie the large star is a dull white, and the smaller one lilac; in Gamma Andro-

INDEX-MAP, LOOKING NORTH, AUGUST 15.]

medæ, a deep yellow and sea-green; in Iota Cancri, a dusky orange and a sapphire blue; in Delta Corvi, a bright yellow and purple; and in Albiero, or Beta Cygni, yellow and blue. In most of the remaining stars of the list the contrasting colours are equally marked, and also in many others which are not included in it. What the effect of this variety of colour would be to the inhabitants of a satellite belonging to such a cosmical system, we have the opinion of Sir John Herschel. "It is by no means intended to say that in these cases one of the colours is a mere effect of contrast, and it may be easier suggested in words than conceived in imagination, what variety of illumination *two suns*—a red and a green, or a yellow and a blue one—must afford a planet circulating about either; and what charming contrasts and 'grateful vicissitudes'—

INDEX-MAP, LOOKING SOUTH, AUGUST 15.

a red and a green day, for instance, alternating with a white one and with darkness—might arise from the presence or absence of one or other, or both, above the horizon."

The principal stars inserted in the lower diagram are Vega, Deneb, Altair, and Ras Alague, west of the meri-

dian, and Fomalhaut, Markab, and Alpherat, east of the meridian. Confining ourselves at present to this diagram, we will commence our survey of the heavens by directing our attention as usual to the zenith, which is now occupied by the north-east corner of the constellation Cygnus. Lacerta and Cepheus join Cygnus in the zenith, which at this time is nearly the point where these three constellations meet. Looking about due west, Deneb will strike the eye about twelve degrees from the zenith, and, farther on, the brilliant Vega shines very conspicuously. South of Vega, but very near to it, Beta and Gamma Lyrae may be distinguished, and a little farther south, Albiero. In the diagrams for next month, most of these stars will have passed our imaginary line from due east to west, and will consequently appear in the upper view. Below Vega, towards the west, there are still a few stars belonging to Hercules, including Rasalgeti, which, with Ras Alague, is visible about twenty degrees above the western horizon. Most of the preceding stars can be identified in the upper part of the right-hand side of the lower diagram. From the zenith to the western horizon we pass through three constellations only, Cygnus, Lyra, and Hercules, excepting a very small portion of Serpens in the horizon. In a south-westerly direction, below Cygnus, the stars in Aquila are the only objects of fair magnitude, although the constellations, Vulpecula, Sagitta, Equuleus, Delphinus, and Sagittarius are passed over. On the exact south meridian we have, in order from the zenith, Cygnus, Lacerta, Pegasus, Aquarius, Capricornus, and Piscis Australis, but none of the principal stars are at present on the meridian, excepting those in Aquarius, which may be found rather more than half-way between the zenith and horizon.

Now let us examine that division of the sky represented on the left-hand side of the lower diagram. We see here many new stars and constellations which have scarcely come under our notice before. Those due east are Andromeda, Triangulum, Aries, and Cetus. In the south-east, the four stars composing the square of Pegasus, Alpha, Beta, and Gamma Pegasi, and Alpha Andromedæ, can now be distinctly seen. Alpha Pegasi, or Markab, and Beta Pegasi, or Scheat, form the south-western and north-western corners of the square. Skirting the horizon from east to south several stars in Cetus and Piscis Australis are visible, including Menkar, or Alpha Ceti in the east, Diphda, or Beta Ceti in the south-east, and the bright star Fomalhaut, a little east of south. The signs of the zodiac above the horizon at midnight in the middle of August are Sagittarius, Capricornus, Aquarius, Pisces, Aries, and parts of Taurus and Gemini, the last being near the horizon in the north-east.

That part of the sky immediately below Algenib, or Gamma Pegasi, is singularly devoid of large stars. It is principally occupied by the constellation Pisces, which, though of no great breadth, extends from the south near the meridian to almost due east. Pisces separates Pegasus and Andromeda from Cetus and Aries. There is no star below Gamma Pegasi, for some distance, greater than the fourth magnitude. Pisces can be identified in the diagram by several small stars east of Alpherat, or Alpha Andromedæ, and below Gamma Pegasi. The small asterism, Piscis Australis, is near the south horizon below Aquarius and Capricornus. Its position is pointed out by its principal star Fomalhaut, which is a very conspicuous object in the south on clear nights. In August, 1868, the planet Jupiter shines brilliantly among the stars in Pisces, below the

W

E

E

W

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, AUGUST 15.

square of Pegasus, and gives additional interest to this quarter of the sky. At present this allusion to the position of Jupiter will be sufficient for the detection of the planet, but in our descriptions for the month of September, we hope to give a small diagram illustrating the apparent path of Jupiter in the heavens for the present year. In the index-map for that month, the position of the planet with respect to the stars will be also indicated.

Delphinus, the Dolphin, although a small constellation, is one of the ancient forty-eight asterisms. The chief stars can be seen in the diagram as a group between the three stars in Aquila and the meridian. It is bounded on the north by Vulpecula, on the west by Aquila, on the east by Pegasus, and on the south by Aquarius. According to Ptolemy, Delphinus contained ten stars, but Hevelius in the seventeenth century increased the number to fourteen. Bode, with telescopic aid, registered fifty-one. Seven of the stars are above the sixth magnitude. Kaswini relates that the lowest star of the group is called the dolphin's tail, and the four in the middle, the necklace or sometimes the cross, that in the tail being the stem of the cross. These stars can be found easily as above, or by the following alignment. Draw a line from Beta and Gamma Lyrae, below Vega, through Albiero, or Beta Cygni, when if continued twice that distance, it will pass through the centre of the group. Or according to the "Celestial Cycle" it can be pointed out by the following rhymes:—

"To heaven's grand arch from deepest seas,
Behold the Dolphin rise,
The grace, as old Manilius saith,
Of ocean and the skies:
'Tis placed between that space wherein
The eagle's wings are spread,
And those few stars unto the east
Which mark the horse's head."

Cygnus, the Swan, is an important constellation between Lyra and Cepheus, and also one of the ancient asterisms. It is situated in the Milky Way, having Draco and Cepheus on the north, Lacerta and Pegasus on the east, Lyra on the west, and Vulpecula on the south. Its principal star, Deneb, or Alpha Cygni, at the root of the Swan's tail, is of the first magnitude. With Vega and Altair, it forms a well-known stellar triangle, visible in the summer and autumn months. The second star in Cygnus, Albiero, is a double star, celebrated, as we have before observed, for the brilliant contrasting colours of its components, which are respectively of the third and seventh magnitudes. Sir William Herschel made a careful comparison of the relative brightness of the stars in Cygnus, the results of which are to be found in the "Philosophical Transactions" for 1796 and 1797. The ancient catalogue of Ptolemy contained only nineteen stars in Cygnus, but Bode's atlas has 360. Cygnus has been noted as the locality of two new stars. The first was observed in 1600 by Jansen, Kepler, and others, and continued visible till 1621, when it became too faint to be seen by the naked eye. Cassini, however, saw the star again in 1655, when it was of the third magnitude, but it soon became again invisible. This object is now known to be a periodically variable star, with an interval of eighteen years between its maximum and minimum brightness. The second new star was discovered by Kirch in 1686, in the neck of the Swan. When at its minimum lustre, this object is too faint to be seen with the most powerful telescope.

A small double star, 61 Cygni, the components of which are of nearly equal magnitude, is one of the most

interesting objects in this constellation. It is a carefully observed binary system. Its interest, however, principally consists in the large proper motion in the heavens of the two components, from which they have been unitedly regarded as one of the nearest of the fixed stars to our solar system. From some delicate researches of M. Bessel, a German astronomer, this comparatively near star to us has been found to be at a distance of about 650,000 times greater than that between the earth and the sun.* Such immense celestial distances are almost beyond the power of the human mind to form a proper conception of their magnitude. Light is known to travel at the rate of about 185,000 miles a second, but with this great velocity, it would take more than ten years to pass over the space between 61 Cygni and the earth. When we, therefore, view this star, we are seeing it as it existed ten years ago, and were any sudden conflagration to take place on its surface to-day, we should only be cognizant of it on our globe in ten years from this date. But this is one of the nearest of the fixed stars, others are supposed to be a thousand times more distant, or even so far that their light has not reached us since their creation. The large and equal proper motion in space of the two stars composing 61 Cygni is a convincing proof of their physical connection, independent of any change in their relative positions.

Deneb is such a prominent object south of the zenith in the summer night-sky, that it seems scarcely necessary to give any special rule for finding this constellation. But if we look at the square of Pegasus, or rather at Alpherat, in the north-east corner of the square, a line from that star to Vega will nearly pass through Deneb.

"From the wing's tip, Alpherat through,
Now skim aslant the skies,
And lo! bedeck'd with glorious stars,
The soaring Cygnus flies:
Or, from the westward should you wish
The same to gaze upon,
Arcturus, Gemma, Vega, join
To lead you to the Swan."

The position of Aquila, the Eagle, can be found by its three principal stars situated west of the meridian, at midnight in August about midway between the zenith and horizon. The middle star of the three is Altair, the upper one Gamma, or Tarazed, and the lower one Beta, or Alshain. This constellation is really composed of two, Aquila proper and Antinous, but in modern catalogues all the stars are included in one asterism. Aquila is in that part of the Milky Way just below Lyra, and is bounded chiefly by Sagitta on the north, Delphinus and Aquarius on the east, Sagittarius on the south, and Ophiuchus on the west. The three principal stars have frequently been taken by young observers for those in Orion's belt, to which, however, they bear but a slight resemblance. Altair is a small first magnitude, and is of a pale yellow colour, Gamma is of the third magnitude, and Beta is about a half-magnitude smaller than Gamma. A line drawn through these stars will point in a northerly direction nearly to Vega, and southerly to the stars in Capricornus. If we now examine the lower diagram carefully, some of the objects in this district can be easily pointed out. Below Vega, which is so conspicuous in the upper part, on the point of entering into the northern half of the sky, the two first stars we reach are Beta and Gamma Lyrae. That slightly to the left, but one-third of the distance towards the three stars in Aquila, is Albiero. The two stars above Gamma Aquilæ, but a little to the right, are

* The distance between the Sun and the Earth, from the most recent determinations, is, in round numbers, ninety-two millions of miles.

Epsilon and Zeta Aquilæ, and those to the west and south also belong to that constellation, which also contains several double stars and nebulae. In the catalogue of Ptolemy, Aquila contains fifteen stars; Hevelius increased the number to forty-two, Flamsteed to seventy-one, and Bode in his atlas includes two hundred and seventy-six.

Vulpecula et Anser, the Fox and the Goose, between Aquila and Cygnus, is a modern constellation introduced by Hevelius in the seventeenth century. "I wished," said he, "to place a fox with a goose in the space of a sky well fitted to it; because such an animal is very cunning, voracious, and fierce. Aquila and Vultur are of the same nature, rapacious and greedy." The small stars below Albiero belong to Vulpecula. Hevelius registered twenty-seven stars in this small asterism, and Bode as many as one hundred and twenty-six.

Sagittarius is the third of the southern signs, and the ninth in the order of the zodiac. It can be recognised by eight stars forming two similar quadrangles, one of which is in the Milky Way. From their low altitude, however, they can only be seen on very clear evenings, about 9 p.m. in August, near the south horizon. At midnight most of the stars in Sagittarius have set in the S.S.W. In the middle ages, when the influence of astrologers was so great, and when no important undertaking was commenced without a previous consultation with the aspect of the stars, Sagittarius was generally considered a lucky sign. One of these old astrological doctors, by name Arcandum, who published a book in 1542 which was "ryght pleasaunte to reade," has declared that a person born under the sign Sagittarius "is to be thrice wedded, to be very fond of vegetables, to become a matchless tailor, and to have three special illnesses;" but as the last attack of sickness is to befall the patient at eighty years of age, it is not of paramount moment. Some of our readers will probably question the value of these peculiar advantages so carefully chronicled by the old astrologer. Ptolemy's catalogue contains thirty-one stars in Sagittarius, that of Flamsteed sixty-nine, and the Atlas of Bode three hundred and thirty-nine. The locality of Sagittarius in the heavens can be discovered by drawing a line from Deneb through Altair, which when produced will pass through the centre of the constellation.

"From Deneb in the stately Swan, describe a line south-west,
Through bright Altair in Aquila 'twill strike the Archer's breast."

In our explanation of the northern midnight sky for August, we will commence as usual at the zenith, which is now scarcely in any constellation, for Cepheus, Lacerta, and Cygnus meet at that point. The true zenith is, however, just within the boundaries of Cygnus. First, let us look towards Polaris, and follow the constellations now on the meridian above and below the Pole. The space between the zenith and Polaris is very nearly occupied by Cepheus, whose two principal stars, Alpha and Beta Cephei, are not far distant from the meridian. They can be easily distinguished from other stars near by their superior magnitude, Alpha being the nearest to the zenith. Gamma, the third star in Cepheus, is slightly east of the meridian between Beta and Polaris. Passing over an unprolific part of Draco below Polaris, the sky as far as the horizon is occupied by a portion of Ursa Major. The seven large stars in Charles's Wain are approaching the lower meridian, the two leading stars, Dubhe and Merak, being a little to the west of north. Below Eta Ursæ Majoris, at the end of the tail of the Great Bear, Cor Caroli can be perceived on very clear nights. Eta Ursæ Majoris is

occasionally designated Alkaid, or Benetnasch, the Arabic denomination for the governor of the mourners, in allusion to the fanciful form of a bier and attendants, produced by the seven stars. All the stars in Ursa Minor are now west of the meridian, surrounded principally by the sinuous Dragon, whose chief stars can be recognised between Ursa Minor and Vega, the two bright stars Beta and Gamma Draconis being at the south-western extremity of Draco. About midway between Beta Draconis and Kocab, in Ursa Minor, is Zeta Draconis, of the third magnitude, the nearest large star to the Pole of the ecliptic. Low down in the west, most of the stars in Hercules can be noticed, and also the semicircular group of the Northern Crown. In the north-west, below Draco, a few stars in Boötes are still above the horizon, and also the greater part of Canes Venatici. The quarter of the heavens east of the meridian contains the whole of Cassiopeia, Perseus, Auriga, Camelopardus, and large portions of Cepheus, Ursa Major, Lynx, and Taurus. Cassiopeia is now very high in the heavens, approaching the meridian. Perseus is below Cassiopeia, and is easily distinguished by its principal stars Alpha Persei and Algol. Camelopardus is east of Polaris and above Auriga. Capella and Beta Aurigæ, the two chief objects in Auriga, can be distinguished in the north-east.

According to the ancients, the constellation Cepheus was placed in the heavens in memory of a king of Ethiopia, or India, husband of Cassiopeia, and father of Andromeda. The old Ethiopic name of this asterism was Hyk, a king. Cepheus is bounded on the north by Ursa Minor and Camelopardus, on the west by Draco, on the east by Cassiopeia, and on the south by Lacerta and Cygnus. The stars Alpha, Beta, and Gamma Cephei, form an arc, of which Beta Cassiopeia is nearly the centre. The head of Cepheus is situated in the Milky Way, and can be identified in the diagram near the zenith, by three stars of the fourth magnitude forming a small triangle. The chief objects in Cepheus are Alderamin in the right shoulder, Beta or Alphirk, in the waist, and Gamma, according to Ptolemy, in the left foot. Cepheus was one of the old forty-eight asterisms, and of considerable note among the wandering shepherds of Arabia. It contains several choice and remarkable double stars, nebulae, and clusters, which have afforded ample subjects for the scrutinizing eyes of modern astronomers. The position of Cepheus and its principal stars can be clearly recognised between Polaris and the zenith, having the bright group of Cassiopeia on the east, and the chief stars of Draco on the west. We can almost imagine the exact form of this circumpolar constellation from the following lines:—

"Near to his wife and daughter, see aloft where Cepheus shines.
The wife, the Little Bear, and Swan, with Draco bound his lines;
Above Polaris, twelve degrees, two stars the eye will meet,
Gamma, the nomade shepherd's gem, and Kappa—mark his feet:
Alphirk, the Hindu's Kalpeny, points out the monarch's waist;
While Alderamin, beaming bright, is on the shoulder placed:
And where, o'er regions rich and vast, the Via Lactea's led,
Three stars, of magnitude the fourth, adorn the Ethiop's head."

Our description of the midnight sky of August will, with the diagrams, be available for earlier and later hours at other seasons of the year. For example, the appearance of the heavens at midnight, on August 15, is the same as that at 10 p.m. on September 15, at 8 p.m. on October 15, at 6 p.m. on November 15, and at 2 a.m. on July 15. The July midnight map will serve for August at 10 o'clock.

In 1868, the moon will be near Jupiter on August 8th, Aldebaran on the morning of the 13th, Mars on the 14th, Venus on the 15th, Mercury on the 17th,

and Saturn on the 24th. During the first week of the month the moon will pass through the signs Capricornus, Aquarius, and Pisces. A day or two after new moon she will be visible as a narrow crescent in the constellation Leo, and afterwards in Virgo. At this time the moon is a very interesting object near the western horizon. On the morning of the 18th a total eclipse of the sun by the moon will take place, commencing on the earth generally at 2.35 A.M. Greenwich mean time, and ending at 7.49 A.M. The sun will be partially obscured in southern Europe, but in the British Isles the eclipse will be invisible. It will, however, be one of the most important solar eclipses which have occurred for a considerable period, as in some districts the time of total darkness will be almost at its greatest possible length, nearly seven minutes. This long interval of darkness will enable observers to note with great advantage the numerous curious phenomena only visible on these occasions. The narrow zone on the earth's surface, where the total obscuration is visible, extends from the entrance of the Red Sea to Torres Straits. It enters India south of Bombay, near Vizian-droog, and crosses the Peninsula, passing near Kollapoore, Muktul, Guntoor, and Musulipitam, from whence it traverses the Bay of Bengal, Tenasserim, and the Gulf of Siam, where the greatest duration of total darkness takes place. The central line then passes through the north of Borneo, Celebes, and the Moluccas, to Torres Straits. The route of the mail-steamers of the Peninsular and Oriental Company between Bombay and Aden will be a favourable position for the observation of the eclipse. Valuable astronomical observations are expected to be made in different Indian localities on the central line of shadow, for which extensive preparations have been made in England, under the auspices of the Indian Government, assisted by the advice of the Councils of the Royal and Royal Astronomical Societies. Two well-equipped expeditions have been, therefore, sent to Central India, one in charge of Major Tennant, R.E., and the other under the care of Capt. Herschel, R.E., son of the veteran astronomer Sir John Herschel.

The phases, or times of change, of the moon are as follows:—Full moon on the 3rd at 11.52 A.M.; first quarter on the 11th at 0.28 P.M.; new moon on the 18th at 5.12 A.M.; and last quarter on the 25th at 0.47 A.M. The moon is at her greatest distance from the earth on the 3rd, and again on the 31st, and at her least distance on the 17th. No star above the fifth magnitude is occulted this month.

Mercury is a morning star, visible near the north-east horizon in the beginning of August, about an hour before sunrise. On the 28th he is in conjunction with the sun, when his light is too much absorbed in the solar rays to be seen even with a telescope.—Venus is now a brilliant morning star, rising in the north-east at 2.56 A.M. on the 1st, and at 1.34 A.M. on the 31st. On the morning of the 7th she is apparently stationary among the stars; on the afternoon of the 15th she is in conjunction with the moon, and on the 21st at her greatest brilliancy.—Mars is a morning star in Gemini. He rises on the 1st at 0.26 A.M., and a few minutes before midnight on the 31st. Mars and Venus are therefore conspicuous objects before sunrise.—Jupiter rises on the 1st at 9.48 P.M., on the 15th at 8.50 P.M., and on the 31st at 7.45 P.M., and sets after sunrise. He is, consequently, both an evening and a morning star, south-east of the well-known square of Pegasus. On the morning of the 15th he is due south at 3.19 A.M.—Saturn is an evening star throughout the month, and

is still near Beta Scorpii. There can be no fear of confusing Saturn with Antares, as the contrast is very evident between the white and steady light of the planet and the reddish twinkling light of the star several degrees nearer the horizon. Saturn sets on the 1st at 11.34 P.M., and on the 31st at 9.37 P.M.—Uranus rises several hours before the sun in the north-east, but a telescope is required to see this planet with advantage.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT REDE.

" 'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

NO. VIII.—HOLIDAY HUMOURS; OR, THE WORLD ON THE WING.

WITH August, the world is on the wing. No sooner has the harvest-month arrived with its rich gifts of golden grain, and those manifold mercies displayed in the ripening fruits of the earth, and in what the American poet Lowell has quaintly called, the "four months' sunshine bound in sheaves," than the exuberance of Nature seems to influence mankind with a wondrous sympathetic feeling of gladness and rejoicing. Although the Almighty Framer of the universe has never left himself without a witness, and, although his power and goodness may be seen and felt in the most sterile scenes and barren wastes, yet, to poor human nature, more readily impressed through the senses of sight and hearing, it seems as though we are shown a greater manifestation of God's works at one season of the year than at another. The seed buried in the earth out of our sight appeals less forcibly to the sluggish mind than the sight of the full ear of corn ripe for the reaper. And so, when the season comes, when the year has attained its maturity of vigour and beauty, the very dullest eyes can see its charms, and the most lukewarm heart beat one bound the quicker, in recognition of the loveliness that is so lavishly displayed to view, and in harmony with all the good impressions that then pour in upon us.

It is then, when the grain-gathering harvest-month shines upon us, that the world seems desirous to make holiday. For some time it has brooded upon this subject; and, during "the month of roses," and its successor, the summer-smitten July, when St. Swithun's oracle is consulted with much forecast and foreboding, it has seemed to poise itself, as says Hamlet, on

"wings as swift
As meditation;"

the theme of its meditation being that important annually-recurring domestic question, "Where shall we go?" And this question, after much anxious debating amid select family committees of each house, is carried, with more or less unanimity—the decisive vote sometimes being given for Scarborough against Switzerland, or for Broadstairs in preference to Baden. When the knotty point has been definitely unravelled, all that Paterfamilias has to do, is to examine into the state of the financial exchequer, and to grant the supplies with a liberal hand. When once the anxiety of the domestic debate has been removed from his mind, and he has duly arranged to his satisfaction the working of those various wheels that are to maintain the due progress of his calling or profession during his temporary absence from his accustomed seat of business, then there is no one more ready than Paterfamilias himself to recognise the forcible truth of that grand old maxim, "All work and

no play makes Jack a dull boy;" a wise saw, in comparison with which, in his eyes, and at that special time, the celebrated sayings of the Grecian sages must pale their splendour. Well, it is in the month of August that all the world is on the wing. Very rarely can the real Parliament of the nation be found to prolong its sittings after the grouse-shooting date of the 12th of August; and the scattering of the Commons and Lords in the Upper and Lower Houses of the Legislature is the signal—if any signal were needed—for the simultaneous migration of the members of other houses through the length and breadth of the land.

It is as though a touring epidemic possessed the entire population, and that every one was smitten by an overpowering feeling to obtain a change of scene and make a brief holiday. Shakspeare's Orlando, when he tells Rosalind that thoughts are winged and go before actions, is told by her that she is in "a holiday humour," and this is the humour in which August finds us. We are filled with what Charles Lamb calls "the holiday-rejoicing spirit," which begets a longing to be free from the tethers of work and the yoke of daily business. The holidays—of which the clerks in the Government offices so feelingly complain as being too few and far between—are the leisure hours of the work-a-day year—a grateful rest snatched from the noontide heat of labour, a brief breathing-time in the hurry and worry of life. They brace the overwrought muscles or overtaxed brain to renewed exertions; they release us for a time from the roar of the great Babel, changing it, perchance, for the more pleasant roaring of the sea; they take us from the smoke-covered city to the purer air of rural scenes—from the din of wheels and hammers to the tinkling chime of the sheep-bells or the thousand melodies of the wood-birds—from the engrossing cares of the man-made town to the holiday delights of the God-made country.

Such a change of scene is not only a luxury, but it is felt to be an occasional necessity; and the poet of "The Task" has well described its expediency in these lines:—

"The earth was made so various, that the mind
Of desultory man, studious of change,
And pleased with novelty, might be indulged.
Prospects, however lovely, may be seen
Till half their beauties fade; the weary sight,
Too well acquainted with their smiles, slides off
Fastidious, seeking less familiar scenes."

And Cowper proceeds to show that, when we thus temporarily renounce a scene that we love, it is not because we are senseless of its charms, but "that such short absence may endear it more." The younger Pliny had come to a similar conclusion when he spoke of the pleasure that attends upon a change of air and scene; and the truth of the observation is fully recognised by every one who has the genuine holiday humour and holiday-rejoicing spirit, whether he be one whose circumstances will only permit him to take a return-ticket to Margate, or a more fortunate person who is able to extend his tour as far as Switzerland or Norway. They who, month after month, are in populous cities pent, and whose profession or business compels them to pass their days amid the distracting scenes of earthly toil, yearn for a brief summer's holiday amid rural sights and sounds, and long to be brought for a time in close communion, face to face, with Nature. And, is not such a feeling, implanted so strongly in the human breast, an evidence of that innate craving for the Better Land to which we each hope to go when the fever and the fret of this life are over? The old poets sought to convey to heathen minds the idea of perfected happiness in

figuring it as a summer-drowse on beds of amaranth and asphodel, in the ever-blooming elysian meads; and this thought is repeated in Tennyson's "Iotos eaters" reclining on similar "beds of asphodel," in the country where it "seemed always afternoon." This fancy is so grateful to the natural sense, that the Christian poets have not disdained to use it, as, for example, in that world-known hymn of Watts, "There is a land of pure delight," where the pleasant country is represented as one where "everlasting spring abides and never withering flowers."

It is not wonderful that the holiday-rejoicing spirit should abound in the harvest-month, and that the world should be on the wing; but it would be indeed wonderful if, at such a glorious season, the Creator's widespread book of nature were not closely and carefully studied and its lessons brought home to the heart. Its lore can be read alike by the learned and unlearned; for the knowledge that is needful for its perusal comes of a loving heart for the Divine Author, and a docile spirit to be taught of him. Man's inextinguishable love of nature has never been better expressed than by the poet Cowper, in a long passage, of which the following lines form a brief portion:—

"'Tis born with all: the love of Nature's works
Is an ingredient in the compound Man,
Infused at the creation of the kind.
And though th' Almighty Maker has throughout
Discriminated each from each, by strokes
And touches of his hand, with so much art
Diversified, that two were never found
Twins at all points—yet, this obtains in all,
That all discern a beauty in his works,
And all can taste them; minds that have been form'd
And tutor'd, with a relish more exact,
But none without some relish, none unmow'd."

It is no purposeless perusal of the great book of nature in which we may indulge during our August holidays; for it will supply us with much food for reflection, and with ample store for intellectual improvement. The tonic of a holiday is most grateful and invigorating; and the harder and more closely a man is kept at his business, or, as the expressive phrase runs, is "nailed to his desk," the greater is the need for his annual relaxation. Even the poor horse in the mill does not grind all the year round; and brain-taxed workers must also have their brief season when they may get "out of harness." This is the very title of that pleasant book on continental travels which Dr. Guthrie wrote when out for a holiday; Judge Talfourd produced two volumes of "Recollections of Three Continental Tours," under the title of "Vacation Rambles and Thoughts;" Dr. Forbes gave the public an account of a month in Switzerland, under the title of "The Physician's Holiday;" and we are indebted for very many amusing and instructive works to those rare holidays when hard-worked men of business find themselves "out of harness." The phrase applies even to costume. The wig, gown, and bands are doffed for wide-awake, easy suit of tweed, or rough pea-jacket; the doctor's gold-headed cane is thrown aside for a fly-rod; members of Parliament and members of the press are girt with knapsacks or game-bags; the baited Prime Minister baits his fishing-tackle in a Highland loch; the worried editor drops his steel-pen for the steel-tipped Alpenstock, well pleased to find a "staff" which gives him no trouble; and even pulpits get a change, for it is a remarkable statistical fact, that the affection of the larynx, known as the *dysphonia clericorum*, or "clergyman's sore-throat," becomes almost an epidemic in August, and necessitates a temporary removal of the sufferer to Torquay, or the mild air of the Undercliff. If any one

is in doubt where to make his holiday, and cannot satisfy himself with a perusal of the guide-books of Murray, Black, Nelson, Bradshaw, and others, he has only to turn to the advertising columns of the "Times," and glance over its columns of holiday announcements, the steamers, the trains, the tourists' tickets, the lodgings to let, the hotels, the shooting and fishing boxes, the paraphernalia deemed by the advertisers to be indispensable to the tourist, from telescopes to waterproof boots, from a sandwich-case to a portable tent.

The harvest-month of August is also the harvest-time for many others than those who are engaged in agriculture. Not only is it the harvest-time of the lodging-house keepers—the Mesdames Pipchin, Lirriper, and Todgers of the British watering-places—but it is also the harvest-time of that widespread class, the Guide—whether he be the Swiss guide, who risks his neck as a recognised part of his professional duties; or the Scotch guide, who shows you the cleanly ruins of Melrose the magnificent; or the Irish guide, whose key-bugle, as you face him in the boat, wakes the echoes of Killarney; or those diverse-charactered English guides, from the village sexton, who unlocks for you the little Norman church, to the stately housekeeper or butler, who shows you my lord's mansion, with the family pictures by famous artists, infamously named by them Slavater Rosy, Georgie Hony, and Horrible Scratchy. Guide and lodging-house keeper alike must regard August as their special harvest-time; and so general is the rush to the seaside at this season, that statisticians might make a curious calculation as to the relative population within gun-shot of the tidal beach in the months of August and January, and also as to what may be the probable extent of the flow of money in August from the centres to the extremities of the country. At such a time, the well-to-do shopkeepers change their characters; and, instead of soliciting custom, are, in their turn, customers and patrons, and freely part with a portion of their yearly gains to those sea-coast traders who live by letting lodgings and purveying necessities and luxuries to holiday tourists. For every one is on the wing in August; not the upper ten thousand only, nor even the upper portion of the great middle class; but tradesmen, shopkeepers, and clerks—all alike can give the reins to their holiday-rejoicing spirit, however brief may be the leisure in which they may be able to indulge. Times are altered, and men with them. The immense and sudden impetus given to a diffusion of knowledge by a cheap press has happened (for good, as it would seem) to take place simultaneously with the remarkable facilities afforded by the railways to procuring a change of scene and air in the quickest manner and at the cheapest price. It is but a trite remark to say, that the poor London clerk or tradesman can do what the mighty Queen Bess, or even the good George III. could not do; and that, within the day, they can readily compass a trip to Margate, Ramsgate, or Brighton, and make that day to yield at least a full eight hours by the seaside. And yet such a remark, trite as it may be, recalls to our minds the tremendous advancement that we have made in this respect since that not remote day when the throne was occupied by the grandfather of our present gracious Queen. But it is reserved for us in the latter half of the nineteenth century to observe emphatically in August that the world is on the wing.

It wings its way hither and thither, near and far. To some, the holiday humour must be compressed in the day; to others, it may be represented by the return-ticket, extending over three, four, or even seven days; to others, again, it may come in the pleasant guise of a

tourist-ticket for a month, and may convey them—perchance as "Cook's Excursionists"—to continental countries, and enable them, on their return, to say with Dr. Johnson:—"All travel has its advantages. If the passenger visits better countries, he may learn to improve his own; and if fortune carries him to worse, he may learn to enjoy his own." It has, in fact, frequently been found that one of the great pleasures of going from home is to get back home again; and that any discomforts that may attend our holiday trip do but enhance the domestic comforts to which we return with a fresh zest when our holiday is ended. Yet, so long as the holiday humour is upon us, and the holiday-rejoicing spirit thrills us with pleasure, we may gladly seize upon our vacation, though it should not find us with vacant minds. For if a man only looks around him upon the prevailing colour of the woods, the fields, and the ocean, he would find that—

"These serve him with a hint
That Nature lives; that sight-refreshing green
Is still the livery she delights to wear :"

and such a hint ought to be taken and used to a good purpose. Of course, much will depend upon the idiosyncrasy of the individual observer as to the impressions that he receives from the scenes that he passes in review. Carlyle, for example, draws a picture of Frederick the Great travelling through Saxon Switzerland and regarding its scenery with a military eye, calculating how one hill would be stormed and another defended. Messrs. Blondin Brown, Leotard Smith, and other esteemed members of the Alpine Club, also regard those hills with calculations how they may best be stormed; but they would attack them with bâton, axe, and rope, and, surmounting the difficulties of glacier and crevasse, would celebrate their triumph by a picnic on the Matterhorn, or a small and early party to view the sunrise from the Righi. And if we would watch the artists in the August holidays, we might see Mr. Sniggle, a painter of the most pronounced pre-Raphaelite school, spending days in the representation of a little patch of ground where the earth's green carpet is "powdered" (as Chaucer expressively says) with daisies; while, not far from him, is his friend, Mr. Splotch, dashing in effects with a broad touch and bold pencil. Each sees Nature in his own peculiar way, and each represents her, as the phrase now is, "loyally." If it is work, it is the pleasant labour of the holiday-taker, who has escaped for awhile from his studio, and who, even if he cannot, as Mr. Hamerton did, pitch his "Painter's Camp in the Highlands," can yet hoist his canvas umbrella, and, under its protecting shade, place upon his drawing-block such subjects as "Highland Girls at the Burn," or the lovely scenery of a West-Highland loch, girt with mountains.

They who would regard the out-of-door painter in the Highlands or elsewhere as a worker, would probably be of that class of holiday-makers thus described by Dr. Mackay as saying:—

"Let me alone to my idle pleasure,
What do I care for toil or treasure?
To-morrow I'll work, if work you crave,
Like a king, a statesman, or a slave;
But not to-day, no! nor to-morrow,
If from my drowsy ease I borrow
No health and strength to bear my boat
Through the great life-ocean where we float."

When the world is on the wing, the majority of holiday-makers are like the moor-born sea-gulls, and unerringly direct their flight seawards. The minority follow the fashion set during the two last seasons, and advocated by many eminent "fashionable doctors," of taking their families to rural and "farmhouse" apartments, and

thereby avoiding the real as well as fancied perils of contagious diseases from which children frequently suffer in much-used marine lodging-houses. Others are more erratic, or fly further afield. Mr. Walton goes to Norway for the salmon-fishing; Mr. Skooner sails his yacht to Crete; Mr. Punter pays a professional visit to Baden; the volunteers who have shot for the ten thousand pounds' worth of prizes at Wimbledon in July, and who have handled Enfields and small-bores even in their dreams, are found before the end of August, up to their knees in heather, dealing destruction to the winged denizens of the moors with the choicest specimens of Purday and Westley Richards; or else they are scattered over the touring districts of the continent. Some make trial of the newly-opened railway route over Mont Cenis, and jokingly contrast its five hours' easy journey with the painful twelve hours drive that had to be taken *summa diligentia*, to quote the oft-repeated schoolboy joke. Others go to Chamouni or to Zermatt, "the young Chamouni," or to Vevay, or Interlachen, or Geneva, or those many other pleasant haunts for tourists which have been so well described in these pages in "The Regular Swiss Round" and "A Trip through the Tyrol," while others, tempted by that "Lady's Glimpse of Bohemia" that was given to the public last year by Miss Eden, find their way to lovely Bodenbach, in the valley of the Elbe, to drink the Güsselghen water and take the Russian baths of iron-water wherewith to cure the mysterious malady known as hay-fever. Other home tourists content themselves with the rival attractions of the various watering-places on the British and Irish coasts—the Dublin Kingstown, the Cork Queenstown, the Ayrshire Ardrossan—Dunoon, Helensburg, and those other charming resorts that cluster round the Clyde—Portobello, the Margate of Edinburgh; the Welsh watering-places, Aberystwyth, Abergele, Llandudao, Penmaen-mawr, Tenby, Beaumaris, Rhyll; the rival English claimants for the holiday-takers, Scarborough, St. Leonards, Ryde, Tynemouth, Weston-super-Mare, Ilfracombe, Whitby, Lowestoft, Hunstanton, Dover, Blackpool, Clevedon, Freshwater, Worthing, Brighton.

And the mention of this London-super-Mare reminds us that the seaside-going mania has only been developed in very recent times. Fifty years since it was comparatively unknown, and the pleasant game of "going to the coast" could only be played by those who had long purses and abundant leisure. Even the Trossachs were undiscovered, or, at any rate, unappreciated and unknown, until the Wizard of the North, in May, 1810, first revealed their beauties in the "Lady of the Lake," and by the wave of his magic wand created those hotels, railways, coaches, and steam-boats, that now enable the tens of thousands of tourists to enjoy the romantic country in the neighbourhood of Lochs Lomond and Katrine. Ventnor was a little fishing village at the beginning of the present century, until Sir James Clarke found it out and called it "The British Madeira," and raised it to be "the capital of the Undercliff." Weymouth was in obscurity, until Mr. Allen (Fielding's "Mr. Allworthy") recognised its value, and the Duke of Gloucester built a lodge there in 1780; yet it was not until nine years after that George the Third set the seal of fashion to Weymouth. What his son did for Brighton is now a matter of history; but, when Dr. Johnson visited the locality, the modern Brighton, with its three-mile seaward range of palatial houses, was the fishing-town of Brighthelmstone. It had its society, it is true; and, notably, the doctor's hosts, the Thrals, in whose hospitable house in West Street, just opposite to the King's Head Inn, where Charles the Second passed the night before he escaped from England,

were given those dinners and evening parties of which we read such graphic accounts in Madame D'Arblay's "Diary," Mrs. Piozzi's "Letters," and Boswell's "Life." There was a promenade on the Steyne, and meetings at the two fashionable booksellers', Thomas and Bowen, and assemblies at "the rooms" at Hick's and the Ship.

But, although Brighthelmstone was very far indeed from being Brighton, yet it was a gay place and the resort of fashion. The Rev. William Unwin paid it a visit in 1781, and his friend the poet Cowper writes to him on his safe return, and makes these remarks on the worldly gaiety of a watering-place: "You did not discern many signs of sobriety, or true wisdom, among the people of Brighthelmstone, but it is not possible to observe the manners of a multitude, of whatever rank, without learning something. If he sees nothing to imitate, he is sure to see something to avoid; if nothing to congratulate his fellow-creatures upon, at least much to excite his compassion. There is not, I think, so melancholy a sight in the world (a hospital is not to be compared with it) as that of a thousand persons distinguished by the name of gentry, who, gentle perhaps by nature, and made more gentle by education, have the appearance of being innocent and inoffensive, yet, being destitute of all religion, or not at all governed by the religion they profess, are none of them at any great distance from an eternal state where self-deception will be impossible, and where amusements cannot enter. Some of them, we may say, will be reclaimed; it is most probable, indeed, that some of them will, because mercy, if one may be allowed the expression, is fond of distinguishing itself by seeking its objects among the most desperate class; but the Scripture gives no encouragement to the warmest charity to hope for deliverance for them all. When I see an afflicted and unhappy man, I say to myself, there is, perhaps, a man whom the world would envy, if they knew the value of his sorrows, which are possibly intended only to soften his heart and to turn his affections towards their proper centre. But, when I see or hear of a crowd of voluptuaries, who have no ears but for music, no eyes but for splendour, and no tongue but for impertinence and folly, I say, or at least I see occasion to say, this is madness. This persisted in, must have a tragical conclusion. It will condemn you not only as Christians unworthy of the name, but as intelligent creatures." These may not be palatable words to many of the butterfly visitors who merely seek a watering-place because of its gaiety or fashion; but, as the best tonics are bitter to the taste, so these strictures of the gentle-hearted poet might be profitably laid to heart by those who would make the very best use of their holidays at the season of the year when the world is on the wing.

One parting word on behalf of those who cannot take wing unless the wings are given to them. At this season many of those who work hard and gratuitously all through the year, in day-schools, Sunday-schools, ragged-schools, city missions, and other similar benevolent and charitable institutions, plead through the advertising columns of the press for a little aid to enable them to take the destitute children and poor scholars for a day's treat into the country—to Epping Forest, Greenwich Park, the Crystal Palace, or, perhaps, even to the seaside. And let them not plead in vain. Even a London Arab and "town sparrow" can recognise the truth of Cowper's words—

"A breath of unadulterate air,
The glimpse of a green pasture, how they cheer."

And a day in the country, spent in a holiday-rejoicing and a thankful spirit, may prove not only a time of present gladness, but an event from which may spring the most humanising feelings and lasting benefits.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—Cowper.

TIMELY RELIEF.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER VII.

OUR chief hope of escaping an unpleasant examination by the pirate existed in the possibility that we had not been observed from her deck. Had we had any sail set we could not fail to have been so. Not, we knew, that so small a craft as ours would be considered worth overhauling; but in case we might give information of the pirate's whereabouts, it might be thought expedient to put us out of the way. So we feared. We therefore watched the progress of the Mignonne and the brig with

intense interest, earnestly hoping that the latter would lead the pirate a long chase before she was captured, if she could not escape altogether, which of course we hoped she would. La Roche had certainly managed to inspire O'Carroll with an extraordinary dread and hatred of him, for brave and calm in danger as our friend had lately shown himself to be, he was now completely unnerved, and I saw him crouching down in the boat as if, even had she been seen, he could have been distinguished. On sailed the brig, gradually her sails began to disappear below the horizon. The pirate still continued the chase. For some time no one in the boat

thought of working. We were roused up by finding that the water was rapidly gaining on us, and we all had to turn to and pump and bale harder than ever. We were in hopes that after all the brig might escape, when the boom of a gun came over the water, followed by another and another. It was too probable that the pirate had got her within range. Both vessels had now disappeared below the horizon, at the same time the wind where we were had completely died away. As far as the pirate was concerned, we began to breathe more freely: it was not likely that he would again pass near us. But the sun shone forth from the clear sky with intense heat, roasting our heads and the brains within them, and making whatever pitch remained between the planks of our deck bubble up as if it had been boiling. There we lay, our boat rolling from side to side, without a particle of shade to shelter us. Our little cabin was like an oven. When we were to rest it became simply a question whether in making the attempt we should be roasted on deck or baked below. We had not much time for idleness yet: though we worked very hard, it was not till nightfall that our rigging was set up sufficiently to enable us to make sail.

When the sun set there was not a breath of air, while the surface of the ocean was as smooth as a sheet of glass, though every now and then a swell rose under the boat's keel, making her roll for ten minutes afterwards, while it glided slowly away in the distance. The only sounds were the clank of the pump and the dash of water from the scuppers or buckets, and an occasional snort of some huge fish, or the splash it made when plunging down into its liquid home. Thus the hours of the night passed away. We were so weary and sleepy that the instant we were relieved from the pump we lay down and were lost in forgetfulness. The day broke, the sun rose higher and higher, and beat hotter and hotter, and all around us was the same smooth, glassy ocean. Now and then the surface was broken by a flight of flying fish as they rose out of it and darted along through the air, glittering bright in the sunbeams, like a covey of silver birds.

"Ah, now; if some of you would just have the goodness to come aboard here, you would serve us nicely for breakfast," exclaimed Trundle, as he observed them.

He had scarcely spoken when upwards of a dozen out of a large shoal leaped, or flew rather, right in among us, while as many more passed clean over the boat. It was a curious coincidence, and at all events afforded us not only a substantial, but a very delicious meal, cooked by the skilful hands of Monsieur Jacotot. It put us all in good spirits, and we began to look at the future in a tolerably hopeful spirit, till my midshipman brother exclaimed—

"I say, if this fun lasts much longer, what shall we do for grub? The sea-pie we have brought has gone bad, and I am afraid that the beef and pork won't keep good many hours out of the brine."

"You may put them in the past instead of the future tense, my boy," observed Trundle, who had been examining the lockers; "I doubt if any stomach with less powers than a shark's could swallow a bit of the meat we have got on board."

"Then on what have we got to exist till we can reach the shore?" I asked, with a feeling of serious anxiety.

"Why," answered William, "we have biscuits and half a cheese—at least we had half when we sailed, but it is rather gone—and a few mangoes and bananas and plantains, and a melon or two, and some tea and coffee and sugar. I am afraid we haven't much else, except

a cask of water, and that was rather leaky, like this precious craft."

"Then let us look to the cask, gentlemen," said O'Carroll. "And don't throw the meat away, putrid though it may be. The Frenchman may cook it so as to make it go down, and we don't know how hard we may be pressed for food."

The water-cask was examined, happily not altogether too late, but a third of the precious liquid had run out. I said nothing, but sad forebodings filled my mind. Even with a compass to steer by and a good breeze to carry us along, we might be several days reaching Port Louis, or indeed any habitable coast we could make. We might be kept out much longer, and then how could we exist? We could scarcely hope that another covey of flying fish would come on board, though we might catch some others if we could manufacture hooks, for I was afraid we had none on board. This calm might continue for a week, and then we might have another gale, for we were in the hurricane season. I advised that we should at once go on an allowance of food and water, a suggestion which was of course adopted. We had no fishing lines or hooks on board: a bit of an old file was, however, discovered, and with it and a hammer Jacotot undertook to make some hooks, while Kelson spun some fine yarn for lines. "I shall have plenty of time," observed the Frenchman, with a wan smile and a shrug of the shoulders, "for without the fish I shall have nothing to cook." Two days passed, and though the hooks were in use we caught nothing, and some of the party began to wish that the pirate had picked us up. Two days more passed: matters had become very serious. Hunger was gnawing at our insides, and what seemed even worse, thirst was parching our lips and throats. With the intense heat we were enduring, gallons of water would scarcely have satisfied us, and we each had but a small wineglass full three times a day. When that was gone, as long as our fuel lasted we could get a little water by condensing the steam from our kettle. Our thirst became intolerable; yet the few drops we did get kept us, I believe, alive. I do not wish to dwell on that time. My own sufferings were great, but they were increased by seeing those of my young brother and his lighthearted companion, both of them about, as I feared, to pass away from the world they had found so enjoyable. The sun rose, and set, and rose again, and each day it appeared to send down its heat with an increased intensity of strength as we grew weaker and weaker. A new danger threatened us: we could even now scarcely keep the boat clear of water; should our strength fail altogether, as seemed but too probable, she would sink below us. Our lot was that which many poor seamen have endured, but that did not make it more supportable to us.

Our last particle of food had been eaten, the last drop of water nearly exhausted. The strongest might endure for a day or two, the weakest ones must sink within a few hours. Even O'Carroll, strong as he seemed, was giving way. He sat dull and unconscious, his eyes meaningless, only arousing himself by a great effort. My brother's head rested on my arm, and I was moistening his lips with the few drops obtained from the cask. Suddenly Kelson, who had been gazing round the horizon, started up, crying out, "A breeze! a breeze! I see it coming over the water." I turned my eyes to the west, the direction to which he pointed. There I saw a dark blue line quickly advancing towards us. Even already on either side cat's-paws were to be seen just touching the surface, then vanishing again, once

more to appear in a different direction as the light currents of air, precursors of the main body of the wind, touched the surface. The effect on our fainting party was magical: even the poor boys tried to lift up their languid eyes to look around. Another shout from Kelson a few minutes afterwards roused us all still more. "A sail! a sail! she's standing this way too." Even Jacotot, who had completely given way to despair, started to his feet at the sound, and weak though he was, performed such strange antics expressive of his joy on the little deck that I thought he would have gone overboard. "If you've got all that life in you, Mounseer, just turn to at the pump again, and make some use of it, instead of jiggling away like an overgrown jackanapes," growled out Kelson, who held the poor Frenchman in great contempt for having knocked under, as he called it, so soon. Jacotot gave another skip or two, and then seizing the pump-handle, or break, as it is called, burst into tears. The two midshipmen and boys soon relapsed into their former state, while O'Carroll seemed to forget that relief was approaching, till on a sudden the idea seized him that the stranger which was now rapidly nearing us was no other than the *Mignonne*, though she had been last seen in an opposite direction, and there had been a dead calm ever since. "Arrah, we'll all be murdered entirely, by that thief of the world La Roche, bad luck to him!" he cried out, wringing his hands. "It was an unlucky day that I ever cast eyes on his ugly face for the first time; and now he's after coming back again to pick me up in the middle of the Indian Ocean, just as a big black crow does a worm out of a turnip field."

In vain I tried to argue him out of the absurdity of his notion. He turned sharply round on me.

"It's desaving me now, ye are, and that isn't the part of a true friend, Mr. James Braithwaite," he exclaimed. "Just try how he'll treat you, and then tell me how you like his company."

I saw that there was not the slightest use reasoning with him, but that it would be necessary to watch him, lest in his frenzy he should jump overboard. As the dreadful idea came on me that he might do so, I saw the black fin of the seaman's sworn foe, a shark, gliding towards us, and a pair of sharp eyes looking wistfully up towards me, so I fancied, as if the creature considered the leaky boat and its contents a dainty dish prepared for his benefit. It made me set to work to bale with all the strength I could muster. Seeing me so employed, O'Carroll for a moment forgot his mad idea, and followed my example. Often and often I turned my gaze towards the approaching ship. It seemed even still open to doubt whether she would pass near enough to observe us.

At length the breeze reached us, and hoisting our sails as well as our strength would allow, we stood in a direction to come across the course the stranger was steering. I told Kelson, in a whisper, to assist me in keeping a watch on O'Carroll, for as we drew nearer the stranger, so did his uneasiness increase, and he was evidently still under the impression that she was the dreaded *Mignonne*. William and Trundle looked at her with lack-lustre eyes. I asked Kelson what he thought she was? "A small Chinaman, or a storeship, may be, sir," he answered. "She's English, certainly, by the cut of her sails."

"You hear what he says," I observed to O'Carroll. "I think the same myself. We shall be treated as friends when we get on board."

"Ye are after desaving me, I know ye are," cried the poor fellow, turning round and giving a reproachful

glance at me. "Don't ye see the ugly villain La Roche himself standing on the cathead ready to order his crew of imps to fire as soon as we get within range of their guns?"

This notion so tickled Kelson's fancy that he fairly burst into a fit of laughter, in which I and the rest of the party faintly joined, from very weakness, for most of them had not heard what was said. Even O'Carroll himself imitated us. Suddenly he stopped. "It's no laughing matter, though, let me tell you," he observed gravely, after some time had elapsed, and the stranger had neared us so that we could see the people on deck. "But where's La Roche? Oh, I see, he's aft there, grinning at us as usual." He pointed to a most respectable looking old gentleman who was, I supposed, the master of the ship.

"You are mistaken in that," said I, feeling the importance of keeping him quiet till he could be got on board. "If that is the *Mignonne*, she has been captured, and is in possession of a British crew. You'll see that I am right directly."

The ship was shortening sail as I spoke. We were soon alongside. Even at a distance our pitiable condition had been observed. We were one after the other hoisted on deck, for even Kelson could scarcely get up without help. I gave a hint to the doctor to look after O'Carroll. "I am right," I remarked to my friend. "If La Roche is on board, he is safe under hatches; so the best thing you can do is to turn in, and go to sleep. You want rest more than any of us."

Led by the surgeon, he went quietly below, and I hoped with soothing medicine and sleep would be soon all to rights again.

The ship proved to be, not what Kelson had supposed, but a vessel with free emigrants bound out to the rising town of Sydney, in New South Wales—a colony generally called Botany Bay, established some few years before, by Captain Phillips of the navy, chiefly with convicts and the necessary soldiers to look after them. We had just told our tale, and the passengers had expressed their sympathy for us, when I heard Jacotot give a loud cry of dismay. On looking over the side the cause was explained—the masts of our unhappy little craft were just disappearing under the surface. This was the natural consequence of our neglecting to pump her out, and the ship, which was going ahead, dragging her through the water, when of course it rushed in through her open seams with redoubled speed. Poor Jacotot tore his hair and wrung his hands, and wept tears of grief for his wretched craft; but, he did not gain as much sympathy as would have been shown him had he been more quiet, though new friends congratulated us the more warmly in having got out of her before she met her fate. Food and rest quickly set most of us to rights, and the following day William and Trundle and I were able to take our places at the cabin table with the rest of the passengers. O'Carroll was kept in bed with fever, though he had got over his idea that La Roche was on board. The old gentleman he had mistaken for him proved to be a minister of the gospel, who had been invited to accompany a party of the emigrants.

We found that things were not going on in at all a satisfactory way on board. The master had died before the ship reached the Cape; the first officer, Mr. Gregson, who had now charge, was obstinate and self-opinated when sober, and he was very frequently intoxicated; the second was a stupid fellow and no navigator; and both were jealous of the third, who was a superior, intelligent young man, and in numerous ways they did their utmost to annoy him. This accounted for the good ship, the

Kangaroo, being very much out of her proper course, which was far to the southward of where she picked us up. Most disastrous consequences were to occur. William and Trundle told me that they had been making their observations; that they wondered how the ship had got thus far, and that they should be much surprised if she got much farther. A very large proportion of the ships cast away and lives sacrificed are so in consequence of the habitual intoxication of the masters and their officers. I venture to make this distinct assertion from the very numerous instances I have known and heard of. We did not wish to alarm the passengers, none of whom had been at sea before, and were not aware of the danger they were running. Had our schooner still floated, I should have proposed taking her to the first island we could make and there repairing her. We asked Mr. Gregson if he would undertake to land us at Port Louis, offering him at the same time payment if he would do so; but he positively refused, declaring that nothing should induce him to go out of his course, and that we must stick to the ship and work our passage till she reached her destination.

Believing that, as he was short-handed, his object in detaining us was to get more hands to work the ship, this we positively refused to do. "Very well, then, we'll see who is master on board the Kangaroo," he replied, with an oath. "You tell me that three of you belong to a man-of-war; but I find you in a French boat, and how do I know that you are not deserters or convicts? and I'll treat you as such if you don't look out." This conduct was so unexpected, and so different from the kind way in which we had been treated by the passengers, that we did not know what to say. We agreed to wait till we could consult O'Carroll; and Trundle undertook to get a look at the chart the captain was using, and to try and find out where he had placed the ship. The wind had hitherto continued very light, so that we had made but little way since we came on board. The day following the unpleasant conversation I have described, O'Carroll was so much recovered that he was able to come on deck. Though Irishmen have not the character in general of being good seamen, I considered from what I had seen of him that he was an exception to the general rule. I told him what we had remarked.

"When the time comes I'll see what I can do," he answered; "but it is ticklish work interfering with such fellows as the present master of this ship, unless one advises the very thing one does not want done."

"We may soon require the exercise of your skill," I remarked. "It appears to me that there will speedily be a change in the weather."

"Little doubt about that, and we shall have it hot and strong again soon," he answered, looking round the horizon.

"Not another hurricane, I hope," said I.

"Not quite sure about that," he answered. "Were I master of this ship, I should make all snug for it; but if I were to advise Gregson to do so, he'd only crack on more sail to show his superior seamanship. I've had a talk with the surgeon, M'Dow, a very decent sort of young fellow, and so I know the man we have to deal with."

An hour or two after this, the wind had increased to half a gale, and the Kangaroo was tearing away through the sea with a great deal more sail than a prudent seaman would have carried. Unfortunately, William or Trundle had remarked that it was much more important to shorten sail on the appearance of bad weather on board a short-handed merchantman, than on board a man-of-

war with a strong crew. I saw O'Carroll looking anxiously aloft, and then again to windward. At last he could stand it no longer.

"You'll let the wind take the topmasts out of the ship if you don't look out, Captain Gregson," he remarked.

"What business have you to come aboard this ship and to pretend to teach me?" answered the master, who was more than half drunk. "If you do, take care. I'll turn you out of her, and let you find your own way ashore."

While he was speaking a loud crack was heard, and the mizen-topmast was carried over the side. This made him order the crew aloft to shorten sail. "You go too, you lazy youngsters," he exclaimed, seeing William and Trundle on deck.

They sprang up the rigging without a word of reply. I watched them with great anxiety, for the masts bent like whips, and I was afraid every moment to see the main share the fate of the mizen-mast, to the destruction of all on the yards. Still the master, as if indifferent to what might happen, was not even looking aloft. The two midshipmen had just reached the top, and were about to lie along the yard, when O'Carroll shouted: "Down, all of you; down, for your lives!"

His voice arrested their progress, and two of the men already on the yards sprang back into the top; but the warning came too late for the rest. A tremendous squall struck the ship. Over she heeled, till the lee bulwarks were under water. A loud crash followed. Away went the main-topmast, and yard, and struggling sail, carrying six human beings with it. Five were hurled off into the now foaming sea. We saw them for an instant stretching out their arms, as if imploring that help which it was beyond our power to give. The ship dashed onward, leaving them far astern. One still clung to the rigging towing with the spar alongside. The ship still lay almost on her beam-ends.

O'Carroll saw the possibility of saving the poor fellow. Calling out to me to lay hold of a rope, one end of which he fastened round his waist, he plunged overboard. I could scarcely have held it, had not William and Trundle with Kelson come to my assistance. O'Carroll grasped the man. "Haul away!" he shouted. In another instant he was on board again with the man in his arms. The helm was put up, the ship righted, the men had got off the fore-yard, and away the ship flew, with the foretop-sail wildly bulging out right before the wind. In a few minutes it was blown from the bolt-ropes in strips, twisted and knotted together. The mainsail, not without difficulty, was handed, and we continued to run on under the foresail, the only other sail which remained entire, and it seemed very probable that that would soon be blown away.

All this time the terror of the unfortunate passengers was very great—the more so that it was undefined. They saw the captain, however, every now and then come into the cabin and toss off a tumbler of strong rum-and-water, and then return on deck, and shout out with oaths often contradictory orders. The gale all this time was increasing, until it threatened to become as violent as the hurricane from which we had escaped. I could not help wishing that we had not left our leaky little schooner. We might have reached some land in her. Now we did not know where we were going, except towards a region of rocks and sandbanks on which any moment the ship might be hurled. For ourselves it would be bad enough; but hard indeed for the poor women and children, of whom there were a dozen or more on board, several of them helpless infants.

As I looked on the man, who was thus perilling the lives of his fellow-creatures by his senseless brutality, I could not help thinking what a load of guilt rested on his head. His face was flushed, his features distorted, his eyes rolling wildly, as he walked with irregular steps up and down the deck, or ever and anon descended to the cabin to gaze stupidly at his chart, which was utterly useless, and to take a fresh draught of the liquor which had brought him to that state. Yet he was a fine, good-looking fellow, and pleasant mannered enough when sober and not opposed. I have known several such, who have for years deceived their owners and others on shore, led by outward appearance, till some fearful catastrophe has been the result of their pernicious habits.

Night came. The ship continued her mad career through the darkness; the wind howling and whistling, the loose ropes lashing furiously against the masts, and the sea roaring around. Below all was confusion. Numerous articles had broken adrift and were rolling about, the passengers crouched huddled together in the cabin, endeavouring to avoid them. Mothers pressed their children to their bosoms; the men were asking each other what was next to happen. The answer came with fearful import. "Breakers ahead! Breakers ahead!" There was a tremendous crash, every timber in the ship shook. She was on the rocks.

PRE-HISTORICAL MAN.

BY S. R. PATTISON, F.G.S.

I.

LORD BACON begins his preface to "The Wisdom of the Ancients," by the statement that "the antiquities of the first age (except those we find in Sacred Writ) are buried in oblivion and silence." This is no longer true, for it is one of the paradoxes of modern days that we get better acquainted with antiquity as we reach farther from it. The printing-press has made all discoveries cumulative. Especially is this the case with regard to recent attainments in pre-historic lore. A new territory is as permanently added to our knowledge as if it were a newly-found planet. All our museums have a fresh case of objects; all our curiosity-lovers have a fresh set of uncouth relics. The miscellaneous contents of barrows and caves, long huddled into obscure corners of collections, are now brought into neatness and order by their classification into stone, bronze, and iron, and each of these is again subdivided by more minute divisions. Our flint implements and barrow-finds are increasing so fast, and quoted so frequently, that it will not be amiss to collect some of the leading facts.

It may startle some of our readers who have not personally examined the relics, to learn that it is now established as a fact, that the first inhabitants of our islands, and of the adjacent continent, were Esquimaux, at least in their mode of life, their implements, and their condition. The barbarous tribes occupying the Arctic regions, are now, save in the use of metals and foreign acquisitions, in a state of non-civilization exactly corresponding to that of our predecessors. Indeed, it would appear that the former are the actual descendants, driven northward, of our "oldest inhabitants." Any collection of implements from the lake-dwellings of Ireland, or from the refuse-heaps of the old Scandinavian folks in Denmark or Scotland, or from the cave-shelters of England, Germany, or France, or from the barrows and cairns of our own fields and fells, shows that

the people of whom these are the relics knew the use of fire, built huts, felled timber, cultivated grain, domesticated animals, hunted, boated, fished, and fought. For awhile they were ignorant of metals, and made tools of native stone; then of imported stone, next of bronze, and last of iron; but, as may be expected, the implements of the first age continued to be used down to the last, and, indeed, are not yet extinct. To them belong the cromlechs and gallery-graves, and those grand monuments of the absolutely dark ages, Stonehenge and Carnac. The term Celtic, applied to these people and their works, only denotes that the period was characterised by a Celtic immigration. Not that the Celts destroyed the Fins, or were destroyed by Belgæ, nor that any total difference existed in the habits or implements of the three races. Doubtless, there were differences, but not such as enable us to assign to each their own share in works which appear to have been continuous and common, with minor variations, to all. We have, undoubtedly, first a Finnish or pre-Celtic age, then a Celtic, then a Belgian admixture, then a Roman invasion. Anterior to the last, we get three stages overlapping each other.

But whilst the historical end of this sequence can be plainly seen, coming down amidst recognised landmarks, and whilst even its middle age, the reindeer period, can also be clearly made out, the beginning eludes our vision. We correlate it with the mammoth and the woolly rhinoceros, but can give no positive dates. The level of the valleys was different, as the gravel and silt which has subsequently filled them testifies. The coast line, which was in its present average condition when the Danish rovers landed, was then somewhat less elevated. The climate was more rigorous, the rivers more powerful, and the ice more extended. The 3,000 cutting or digging tools found in the gravels of the Somme and the Thames, show that man was here, but we have no other token of his presence. Undoubtedly time must have flown by, in the succession of very many centuries, between the date of the rude stone tool and that of the bronze urn. But if we find that from the one to the other there is a regular gradation, interrupted, too, by the occasional introduction of foreign materials, we may safely infer that there has been but one series, however disturbed by the occurrence of physical changes, or varied by the occurrence of adventitious relics. The first flint implements indicate a hunter's wants amidst a hunter's field. They tell of the pursuit of game more vast than the sportsman can now follow or find. The practice of his art of tool-making on the shoals of the chalk gravel rivers, or of the mammalia in the scanty thickets, was suspended by the occurrence of a long-continued series of floods, until the ice-bound table-land of the water-sheds yielded to the influences of milder temperature, until the mammoth and its associates had died out. After a while, we know not how long, the Finlike tribes again visited and now remained on the lakes and river banks, and, in due time, reared their hovels and built their sepulchres, their temples, and their camps on the uplands. Chronology is quite at fault in attempting to assign any positive dates to these transactions; nor do the other sciences attempt to construct anything more than the faintest relative record; nor does the Bible deal with these occurrences or these localities: it refers neither to the people nor to the places, save by its general statement of the degeneracy and misery of the masses of mankind which had departed from the knowledge of God. We have all the ages before the advent of our Lord on earth, all the years before the Roman invasion of Gaul and Britain, in which to place the historic end

of that sad story which perhaps commenced long before the flood.

We shall get a more definite and accurate view of this curious subject, by classifying some leading types among the pre-historic relics. The following list is compiled chiefly from Mons. Mortillet's catalogue of the pre-historic industrial works in the Paris Exhibition, supplemented by Nilsson's beautiful work on "The Primitive Inhabitants of Denmark," edited by Sir John Lubbock, and by the ample collection in Mr. Christy's Museum, Victoria Street, Westminster.* The attempt at chronological classification is our own.

FIRST PERIOD.—MAMMOTH EPOCH.—Rough flint tools from the gravel of the Somme Valley, Allier Valley, Thames Valley, Bedford, Suffolk, associated with remains of extinct races of animals.

Flint flakes and barbs, slightly dressed as knives, and scrapers, found near Amiens. Mammoth, rhinoceros, &c., abounded in Europe.

TRANSITION.—Tools of former type, with arrow-heads more carefully dressed, and flint scrapers. Moustier, in Dordogne, France. See Christy Collection.

Tools of former type, mingled with piercers and arrow-heads of finer workmanship, at Pontlevy, also with well-polished foreign stones.

Tools of former type, with flint flakes, at Clichy.

The same mixture, with more advanced art, in caves of La Vienne.

Objects of rude type mixed with bone ornaments and bone arrow-heads, and remains of hyena, rhinoceros, and elk, in the sepulchre at Anrignac.

In other caves in south of France, the bone-relics of extinct races of animals, mingled with dressed flint tools.

In the Grotto d'Arcy are two floors. In the lower one are found flint scrapers, with remains of the extinct fauna; in the upper one (of course consolidated long afterwards) are polished stone implements.

At Charente.—Tools of St. Acheul type, with abundant stone implements of polished period.

At Bruniquet.—Tools of first type, with harpoons and other implements of the reindeer period; some ornamented with figures. One having the distinct representation of the extinct mammoth.

La Chaise.—Flint flakes, with bone tools and reindeer horns.

Imola.—Somme Valley tools with arrow-points of second period.

Langerie.—Remains of extinct animals, with fish-hooks, barbs, and polished stone tools, pierced shells for ornament. Sculpture of Aurochs on bone.

SECOND PERIOD.—Reindeer epoch. Mammoth not found. Manufactories of flint tools more fully dressed than preceding, stones for grinding and polishing. See remains from Pressigny in Christy Collection. Remains of reindeer, shell necklaces, and still finer flint tools and bones of domesticated animals.

Swiss bone tools and abundant relics of industry and art of lake-dwellers, also polished foreign stone tools.

Refuse heaps of Denmark.

Irish flint tools and net sinkers, fishing implements, &c.

Numerous caves in south of France with remains of reindeer.

TRANSITION II.—Gallery tombs, with rude piercers of flint and drilled stone implements. Nilsson.

Caves in Arriege.—Bones of horse, pig, dog, and beaver, with polished stone tools and pottery.

Somersetshire and Devonshire cave remains.

Yorkshire barrows, with flint tools and scrapers; pottery, but no metal.

The Cromlech era, with burials of stone age. See "Leisure Hour," May, 1866; particularly note the method of attaching the common flint implement represented on the inner surface of a cromlech cover in Brittany, p. 316.

Lake dwellings in Switzerland.

Contents of British barrows of the stone age.

THIRD PERIOD.—Introduction of Metal. Flint and stone tools still used, but with finer pottery, more polished stones, more marks of domestication, bronze weapons, and ornaments. No relics either of extinct races of animals or of reindeer period.

FOURTH PERIOD.—Iron and History.—To this class belong the bulk of our barrow interments, and of the lake remains. Thirty lake-villages or forts, built on piles, with causeways of wood, have been discovered in Scotland, and more still in Ireland, where they are called crannoges, and were in use from the ninth down to the sixteenth centuries.*

A lively and popular summary of our existing knowledge on the whole subject of this class of relics, appeared in the *Times'* report of the Great French Exhibition of 1867:—

"As might be expected, France has produced a collection of extraordinary completeness and interest, although in some respects, other countries have special objects of considerable value. The French galleries show how many local antiquarian societies exist in the country, and the number of persons who take an interest in the contents of ancient kitchen heaps, and in the relics of past ages, while they demonstrate the enormous difficulty of joining on, as it were, one age to another, by a complete series of developments in their works. The chronological succession of the progress of national arts is not easily exhibited when there is no record of long periods of transition, and it is probable, nay, certain, that there must have been periods in which the age of unpolished stone implements, for instance, ran into the polished stone age, and when the polished stone age was mixed up with the age of bronze, and when bronze and iron were used together.

"'La Gaule' 'before the use of metals,' was a very different country from that in which the legions had to contend with the Allobroges and other tribes, with leaders of quite unintelligible names under the great Consul. Long before their time there lived a race of men whose life, if truly illustrated by the result of researches, must have been miserable indeed. The remains before us, scratched up from the upper crusts of the earth, are supposed to represent all these races knew of the various appliances by which human existence is distinguished from that of the beasts of the field. There is something almost ironical in calling these pieces of bone and stone, *produits d'art et d'industrie*. The age of stone was, as we have said, a terrible time for man. As he was most helpless, so was he most exposed to the assaults of dreadful enemies. When he had only hatchets of stone and arrow and spear-heads of bone, the hippopotamus, the elephant, the rhinoceros, the great cave bear, the great cave cat, the hyæna, the aurochs, etc., flourished over and about him. As he got on to polish the stones which before had been simply cut, he associated with himself, under conditions we can never know, the horse, the ox, the goat, the sheep, and the dog.

"In the first case of wedges, hatchets, lance-heads, knives, etc., of flint, picked up in the drift of the bed of the Seine, the Somme, and other rivers, there is an attempt to mark the chronological order. The next series consists of similar implements found in caves and similar places, on which there are traces of human work, showing, as the enthusiastic author of the catalogue thinks, that '*le travail semble avoir sensiblement progressé*.' These relate to the first epoch of the cavern age. The reindeer seems to have had the worst of it in the second epoch of the caverns. His horns and his bones were found to make capital spears, arrows, and fishing-lances, and the dashing antiquary who drew up the catalogue declares they were '*fabriqués avec une grande perfection, et quelquefois ornés de gravures ou sculptures disposées avec goût*!'

"These cave-men were singular in that they did not care much to carve likenesses of their own sort, which

* This unrivalled collection may be seen on Fridays, by ticket obtainable from the curator, A. W. Franks, Esq., British Museum.

* "Transactions of the Royal Irish Academy," vol. vi. p. 340.

is much to be regretted, as a good *gravure* of an indigenous Gaul would be invaluable. These clever fellows got at last to polishing their hatchets of flint and spear-heads, and there are numbers of very fine specimens of such work, the interest in which is somehow not so great as that excited by the sight of the very stones on which the celts were grooved and polished, with the fissures and grooves as plain in them as they were the very day when the needy celt grinder was disturbed at his labour by the propinquity of an auroch or the sudden onslaught of a cave bear. In spite of their polished manners in hatchets and the like, the *genus homo* had such hard times of it that he took to a beaver sort of life, and at last fled to locustine habitations, which give to the antiquarian the Third Period of these stirring times, when it was a fight between him and the creatures he would have probably hesitated to call "the inferior animals." He now achieved pottery, and made bodkins and needles of bones, and had horses, cattle, goats, dogs, and sheep, about him, as their bones are found in his dwellings, but there is no trace there of the animals which are called extinct or *émigrés*, and which characterised the first and second epochs of the Stone age. Why they became extinct it is not easy to imagine. They might have emigrated *en masse* as soon as they found their food had gone off to become the prey to rheumatics in lacustrine lodgings, but even that point requires faith or elucidation. We next come to the age of transition, when a lucky fellow got a piece of metal and flourished it about in triumph among the pure and simple lapidarians.

"The articles got out of 'dolmens,' in France and Savoy, which it may not be remembered by us all is now part of France, furnish most remarkable shelves. The names of the proprietors are affixed to the articles, and we are enabled to see that many persons in France are interested in such collections. There is a whole armoury of flint implements in the first and second halls; and it speaks well for the honesty or want of fraudulent enterprise on the part of the people that there are comparatively few specimens of uncut and unpolished hatchet-heads of the Stone period, when it is considered how easy it would be to fabricate them, and how difficult to decide whether a tool of that sort was ten thousand years or a few days old.

"In the second age of cavern life, the reindeer played, as we have said, an important part, and his bones and horns were turned to good account, but the *elephas primigenius* still held on—or is supposed to have done so, though it might be argued that the discovery of his molars here and there in the remains of the period proves nothing. In this epoch we have a human jaw-bone, and there is a whistle made of the phalanx of a reindeer, with a hole bored through it, which it would be hardy to say was ever played upon by the jaw in question, because it was found with it at 'Lagerie Basse.' The luxurious tastes of *homo* now become apparent in barbed arrows and harpoons—he was getting a taste for fowl and fish, and had learnt to grind up grain in a mortar, and had invented a marrow spoon! at least, say Messrs. Lartet and Christy of an instrument, that in it "*on a cru reconnaître une cuillère d'extraire la moelle des os*" (but they add two notes of interrogation), and had taken to using fire rather liberally, and to immense carving on reindeer horns. It is curious, indeed, to find in one of the cases of relics from the Dordogne caves two pieces of bone exactly the same as those which the natives of the Marquesas Isles wear in their nostrils at the present day, along with teeth of animals pierced for ornaments, and the bones of horses, foxes, wolves, wild boars, belonging to a

period when man, in spite of marrow-spoons and ruffles, must have looked on hunting as a very serious occupation.

"From sepultures, dolmens, and caves of the third epoch in the second age of stone, we get granite mallets, polishing blocks of sandstone, hatchets of diorite, ophite, aphanite, jadeite, fragments of earthenware, carved deer and other bones, bones of pigs and dogs, along with those of the animals already spoken of in the former epoch, except the reindeer, which suddenly goes off to Norway, and we lose sight of Lartet and Christy completely at this period. M. M. Pommerol shows a case which, in addition to eight blades and scrapers of flint and a hatchet of fibrolithe, contains some carbonized or half-burnt barley; and one human jaw-bone is exhibited by M. de Lavaud; but there is a good deal of uniformity in the objects of this epoch, in spite of the introduction of the dog. We move on to the next, which is that of transition—the first appearance of metal. Although the collections are meagre enough, there are some interesting specimens in this period. Bronze blades appear, and the use of it is seen in the facility with which teeth and bones are cut and pierced, and the number of ornaments for the neck."

The context of this dark riddle concerning man's first appearance in western Europe, shows him not as a resident, but a visitor, working and using rough flint tools, amidst an assemblage of great and fierce animals no longer existing, and amidst conditions now only existing near the Arctic regions. We next see the remains of the long-continued action of land-waters which accompanied the lowering of the temperature, throwing down deep beds of gravel and loam. With this amelioration we come to a reindeer period, and man as a resident without the use of metals. Next comes a race bringing foreign stones and more art, but with similar habits, mingling with the former people, raising lofty tombs and temples, soon obtaining bronze instruments, and living on to the era of history.

The most recent discoveries on this subject are, first, of flint implements, precisely similar in form to those from the Somme Valley, spread for hundreds of miles along the Madras coast, and up to a height of 300 feet on the slopes, in a formation called *laterite*, the equivalent of our gravel bed. No other remains have yet been found. Second, a whole village of the polished stone period, without trace of metal, but with gracefully-shaped pottery, mortared walls, carpentry in olive-wood, elegant art in flint and volcanic stone tools and utensils, found under pre-historic ash-beds at Santorin, amidst the successive volcanic emissions which have destroyed a once-flourishing group of islands.

DR. JOSEPH DALTON HOOKER, F.R.S.,

PRESIDENT OF THE BRITISH ASSOCIATION.

WITHIN four days of his lamented death, on the 12th of August, 1865, Sir William J. Hooker was superintending improvements in the Royal Gardens at Kew, of which he was the director; and which in so many respects he had enriched and adorned by his fine taste, his scientific knowledge, and his untiring energy. His son, Dr. Joseph D. Hooker, a botanist not less distinguished, and who was already assistant-director at Kew, was appointed to the vacant post of director on the 12th of November following. In his first report addressed to the Commissioners of Woods and Forests, dated 1st January, 1866, Dr. Hooker thus speaks of his eminent father: "This is not the place, nor would it be fitting

in me to dwell on the merits of my father; I must, however, claim the privilege of paying such a tribute to the memory of my predecessor as has been unanimously felt to be due to him, viz., that whether as the restorer of these gardens, who, by his sagacity and energy, raised them above all others in excellence, beauty, and utility, or as the originator and founder of museums of economic botany; or as the projector and able assistant of those efforts on the part of our home and colonial governments that have led to the formation of botanical and horticultural establishments in so many of our colonies, in India, and in our foreign possessions; or as the liberal and disinterested patron of private scientific enterprise everywhere, and especially amongst the officers of the army, navy, and civil services, the late Director of Kew has won the esteem and gratitude of his countrymen, and left a name that will ever occupy one of the most prominent positions in the history of botanical science." The present Director of Kew is sprung from a race of botanists. His paternal grandfather, a citizen of Norwich, devoted his leisure time to the cultivation of curious plants. This circumstance, doubtless, helped to create that taste for botany which, in the career of his illustrious father, has borne such ripe fruits. On the maternal side—the grandfather of Dr. Hooker was Mr. Dawson Turner, of Yarmouth. The eldest daughter of this gentleman became the wife of Sir William J. Hooker, in 1814. Mr. Turner's is a well-known name in the annals of British botany; he is the author of various botanical publications, and it was at his suggestion that a narrative of a visit made to Iceland in 1809 by his future son-in-law was given to the world, a work which first brought prominently to the notice of scientific men the name of William Jackson Hooker. So descended, Joseph D. Hooker was born at Halesworth on the 30th of June, 1817. Although thus by birth a native of Suffolk, by association and descent the subject of our notice is a Norfolk man. No county of England has produced an array of such distinguished botanists as Norfolk—Smith, Turner, Lindley, the elder Hooker, are all natives of Norfolk. It is, therefore, befitting on the first meeting of the British Association in the capital of that county that a botanist, and especially that Dr. Joseph Hooker, should occupy the position of president.

Consequent on the appointment of his father to the chair of Botany in the University of Glasgow in 1820, Joseph Hooker at a very early age was removed to the metropolis of the West of Scotland. There he grew up and was educated; and qualifying himself for the Medical Profession he took the degree of M.D. in the University. He did not, however, practise medicine, but devoted his attention to various branches of scientific study; and attached himself to the Royal Navy with the view of prosecuting botanical research in distant countries. An opportunity occurred in 1839; in that year Government, for the purpose of Geographical discovery and other allied investigations, fitted out an expedition to the Antarctic Regions. The ships *Erebus* and *Terror*, commanded by Sir James Clark Ross, sailed from Chatham on the 29th of September of that year. Dr. Hooker left England as assistant surgeon to the *Erebus*, and botanist to the Expedition. On the outward voyage Madeira, Teneriffe, and Cape de Verde Islands were visited. A week's stay at St. Helena was turned to account by Dr. Hooker in investigating the vegetation of the island—which he found had been almost entirely changed by the introduction of a new flora. On the 6th of April, 1840, the vessels left St. Simon's Bay. At the rugged, mountainous, and almost desolate

Kerguelen's Island, two and a half winter months were spent—and all the plants were gathered by Dr. Hooker which had been detected by Captain Cook in 1779—a remarkable proof of the uniformity of the climate in the island, and of the comparative mildness of the winter season. From Van Diemen's Land the expedition started for the South Pole on the 12th of November. Lord Auckland's Islands, reached after a week's sail, was the only place in the southward course which yielded plants. The vast extent of continent called on the map Victoria Land was discovered during the voyage, together with an active volcano, Mount Erebus, and an extinct one, Mount Terror. The vessels returned to Hobarton in April, 1841. During a second cruise, three months were spent at New Zealand, and were industriously employed by Dr. Hooker in collecting materials for a flora of these islands. A prolonged stay at the Falklands afforded ample opportunities for thoroughly investigating the flora of that interesting and highly important group. A third and last voyage to the south Polar regions was made from Berkeley Sound on the 17th of December, 1842. Owing to the vast proportion which water bears to land, the farther south the voyager penetrates, the more equable the climate becomes. "All the islands and land southward of 45°," remarks Dr. Hooker, "partake more or less of an inhospitable climate, which though eminently unfavourable to a varied growth of plants, still, from its equable nature, causes a degree of luxuriance to pervade the vegetable kingdom, such as is never seen in climates where the vegetable functions are suspended for a large portion of the year." From his extensive observations in the south Polar regions, the botanist of the expedition was led to draw the following interesting scientific inference: "The remoteness of these islands from any continent, together with their inaccessibility, preclude the idea of their being tenanted even in a single instance by plants that have migrated from other countries, and still more distinctly is forbidden the possibility of man having been the active agent in the dissemination of them; on the contrary, the remarkable fact that some of the most peculiar productions are confined to the narrowest limits, is a strong argument in favour of a general distribution of vegetable life over separate spots of the globe. Hence it will appear that islands so situated furnish the best materials for a rigid comparison of the effects of geographical position and the various meteorological phenomena on vegetation, and for acquiring a knowledge of the great laws according to which plants are distributed over the face of the globe."

Dr. Hooker makes full acknowledgment of the aid he received in his botanical labours from his shipmates—and especially from the commanding officer of the expedition—Sir James C. Ross. That officer placed at the disposal of the botanist his private cabin and library, promoted to the utmost the interests of the collections, and himself gathered many of the plants with his own hands.

The result of the researches, and of the collections made by Dr. Hooker during this the most important and interesting scientific voyage promoted by Government since the days of Cook, was a series of superb volumes on the Botany of the Antarctic Regions—embracing the flora of the Auckland Islands, New Zealand, and Tasmania. These volumes contain valuable introductory essays embodying the knowledge and philosophical views of the author on the subjects of which he treats. Her Majesty's Treasury, in aid of the publication, granted the sum of £1,000, to be expended

solely on the drawing and lithography of five hundred quarto coloured plates: These, together with the descriptive matter written by Dr. Hooker, it may be mentioned, have been given by the author free of all cost and all share of the proceeds of the undertaking

Desirous of adding to his acquaintance with the botany of the Antarctic regions, and of the temperate zones, more knowledge of the tropics than he had hitherto had the opportunity of acquiring, Dr. Hooker again resolved on travel, but hesitated between India

Joseph Dalton Hooker

H. T. Whitlock, Birmingham.

to the publisher, who has thus been enabled to bring out the series at a very much more moderate price than would otherwise have been possible.

In this disinterested manner, and with much ability, did Dr. Hooker discharge the task of the preparation of these volumes, entrusted to him by the Admiralty in 1843. Numbering six volumes in all, the first two of the series were published in 1847, the last two much more recently. We may here mention that the Colonial Government of New Zealand entrusted to Dr. Hooker the preparation of a work giving a compendious account of the plants of that colony, and placed at his disposal the necessary funds, including a liberal remuneration for his services. The work was issued, in two parts, in 1864 and 1867.

and the Andes. At length he decided on India, being chiefly influenced by the late Dr. Falconer.* This gentleman drew his attention to the fact of the ignorance prevailing on the geography even of the central

* Dr. Falconer was born at Forres, in the county of Moray, in 1808, and was educated at King's College, Aberdeen, and the University of Edinburgh. In 1829 he received an appointment in the East India Company's service, but before proceeding to India he devoted a year to the study of botany and geology. Superintendent first of the Botanic Garden at Suharunpoor and afterwards of that at Calcutta, it was mainly upon his advice that Government sanctioned the experimental trials of the growth of tea in India which were carried to a successful issue under his supervision. Dr. Falconer returned to England in 1856 or 1857, and during the rest of his life devoted himself to the study of mammalian palæontology. He was Vice-President of the Royal Society, and died 31st January, 1865. Two volumes of "Palæontological Memoirs and Notes" have been recently published, edited by Dr. Murchison. (Hardwicke.)

and eastern parts of the Himalayas, while all to the north was involved in a mystery equally attractive to the traveller and the naturalist.

Sikkim was the region recommended to Dr. Hooker as untrodden ground. The journey assumed the character of a Government mission. The collections were to be deposited at Kew, and the traveller was allowed by the Treasury £400 a-year during the time of his travels. "No part," he says, "of the snowy Himalaya eastward of the north-west extremity of the British possessions had been visited since Turner's embassy to Thibet, in 1789. . . The possibility of visiting Thibet, and of ascertaining particulars respecting the great mountain Chumulari, which was only known from Turner's account, were additional inducements to a student of physical geography; but it was not then known that Kinchinjunga, the loftiest known mountain on the globe, was situated on my route, and formed a principal feature in the physical geography of Sikkim." Dr. Hooker mentions the circumstance that his earliest recollections in reading were of "Turner's Travels in Thibet," and of "Cook's Voyages." The account of the Lama worship, and of Chumulari in the one, and of Kerguelen's Land in the other, took a strong hold on his youthful fancy. It was, therefore, singular that Kerguelen's Land should be the first really strange country he visited, and that too in the first king's ship which touched there since Cook's voyage, and whilst following in the track of that illustrious navigator in south-polar discovery; and that at a later period he should have been nearly the first European who approached Chumulari since Turner's embassy.

Starting on his journey, Dr. Hooker sailed to Egypt, in the same steam-vessel which conveyed the Marquis of Dalhousie, the newly-appointed Governor-General of India, on his way to Calcutta. He cordially acknowledges his obligations to that nobleman, for much personal kindness, for procuring him admission into Sikkim, and in honouring him throughout his travels with the kindest encouragement. A series of letters, written by our traveller to his private friends, and published in the "London Journal of Botany," detail the observations made in Egypt, at Aden, Ceylon, and Madras, and also give an account of an excursion among the plains and hills of Western Bengal, south of the Ganges. Dr. Hooker makes special mention, also, of the obligations he incurred to Brian H. Hodgson, Esq., during his two years' stay in Sikkim, and who was for many years British Resident at the Nepal Court.* Dr. Campbell, the

Superintendent at Darjeeling and the Governor-General's agent in communicating with the Sikkim Rajah, afforded him, likewise, much assistance in obtaining access to that country.

Dr. Hooker thus records his first impression of the Himalayas: "Much as I had heard and read of the magnificence and beauty of Himalayan scenery, my highest expectations have been surpassed. I arrived at Darjeeling on a rainy, misty day, which did not allow me to see ten yards in any direction, much less to descry the snowy range distant sixty miles in a straight line. Early next morning I caught my first view, and I literally held my breath in awe and admiration. Six or seven ranges of forest-clad mountains, as high as that whereon I stood (8,000 feet) intervened between me and a dazzling white pile of snow-clad mountains, among which the grand peak of Kinchinjunga rose 20,000 feet above the lofty point from which I gazed. Owing to the clearness of the atmosphere, the snow appeared to my fancy but a few miles off, and the loftiest mountain at only a day's journey. The heavenward line was projected against a pale blue sky; while little detached patches of mist clung here and there to the highest peaks, and were tinged golden yellow or rosy red by the rising sun, which touched these elevated points long ere it reached the lower position which I occupied. Such is the aspect of the Himalayan range at early morning. As the sun's rays dart into the many valleys which lie between the snowy mountains and Darjeeling, the stagnant air contained in the low recesses becomes quickly heated; heavy masses of vapour, dense, white, and keenly defined, arise from the hollows, meet over the crests of the hills, cling to the forests on their summits, enlarge, unite, and rapidly ascend to the rarefied regions above—a phenomenon so suddenly developed that the consequent withdrawal from the spectator's gaze of the stupendous scenery beyond looks like the work of magic. Such is the region of the Indian Rhododendrons." The above graphic description occurs in the preface to Dr. Hooker's magnificently illustrated volume, entitled "The Rhododendrons of Sikkim-Himalaya," which is edited by his father, Sir William J. Hooker, and dedicated to Her Royal Highness the Princess Mary of Cambridge. These plants were discovered by Dr. Hooker, in his botanical mission, and the drawings and descriptions were made by him on the spot. Another work we may here notice, of which the descriptions and analyses were supplied by Dr. Hooker, bears the title, "Illustrations of Himalayan Plants, chiefly selected from Drawings made by the late J. F. Cathcart, Esq., of the Bengal Civil Service." This publication sprung out of a desire on the part of the author to connect the name of his friend Mr. Cathcart, in consideration of the great services he had rendered to botanical research in India, with the history of the botany of that country.*

While prosecuting his labours in the territories of Sikkim, Dr. Hooker, along with Dr. Campbell, was seized, and for a number of weeks detained a prisoner by a faction of the Sikkim Court, having suffered much inconvenience and many hardships during the period

Europe. To be welcomed to the Himalaya by such a person, and to be allowed the most unreserved intercourse, and the advantage of all his information and library, exercised a material influence on the progress made in my studies and on my travels.—Extract from preface to Dr. Hooker's "Himalayan Journals."

* Mr. Cathcart was devoted to the pursuit of botany, and caused a magnificent series of drawings of Darjeeling plants to be made by native artists during his residence there. This collection is now deposited at Kew, through the liberality of his family. After the expiration of his Indian service this gentleman returned to Europe, and died at Lausanne, on his way to England.

* Mr. Hodgson's high position as a man of science requires no mention here; but the difficulties he overcame, and the sacrifices he made in attaining that position, are known to few. He entered the wilds of Nepal when very young, and in indifferent health; and finding time to spare, cast about for the best method of employing it. He had no one to recommend or direct a pursuit, no example to follow, no rival to equal or surpass; he had never been acquainted with a scientific man, and knew nothing of science except the name. The natural history of men and animals, in its most comprehensive sense, attracted his attention; he sent to Europe for books, and commenced the study of ethnology and zoology. His labours have now extended over upwards of twenty-five years' residence in the Himalaya. During this period he has seldom had a staff of less than from ten to twenty persons (often many more), of various tongues and races, employed as translators and collectors, artists, shooters, and stuffers. By unceasing exertions and a princely liberality, Mr. Hodgson has unveiled the mysteries of the Buddhist religion, chronicled the affinities, languages, customs, and faiths of the Himalayan tribes, and completed a natural history of the animals and birds of these regions. His collections of specimens are immense, and are illustrated by drawings and descriptions taken from life, and with remarks on the anatomy, habits, and localities of the animals themselves. Twenty volumes of the journals, and the Museum of the Asiatic Society of Bengal, teem with the proofs of his indefatigable zeal; and throughout the cabinets of the bird and quadruped departments of our National Museum Mr. Hodgson's name stands pre-eminent. A seat in the Institute of France, and the Cross of the Legion of Honour, prove the estimation in which his Buddhist studies are held on the continent of

of his captivity. Such of his collections as reached Calcutta were forwarded to England, in excellent order, and placed in Kew Gardens. The Government, influenced by a number of the leading men of science, continued to Dr. Hooker the allowance of £400 annually for three years, to enable him to arrange, name, and distribute his valuable collections, and also to publish his manuscripts.

For the information of future travellers, Dr. Hooker has stated that his Indian journey cost £2,000, of which £1,200 were defrayed by the Government. This sum is, however, exclusive of £200 which he paid for books and instruments, and of the freight of the collections to England. A very ample and most interesting account of the journey was published in two volumes, with maps and illustrations, under the title, "Himalayan Journals; or, Notes of a Naturalist in Bengal, the Sikkim and Nepal Himalayas, the Khasia Mountains, etc."

Of Dr. Hooker's travels in the East, the late Professor Edward Forbes thus speaks: "To ramble among the mightiest monuments of the earth, to wind, as it were, in and out among the vertebræ of the old world's backbone, must be a great pleasure to any traveller. How much more to one who is thoroughly trained and experienced in research, a naturalist of the first degree. Dr. Joseph Hooker is at the present moment one of the most distinguished of European botanists. At a comparatively early age he has gained, and justly, a reputation that, great as it now is, grows daily. The author of the 'Flora Antarctica,' one of the most valuable contributions to systematic and geographical botany ever published, has gathered new laurels within the tropics, and has proved himself, if more proof were necessary, as worthy as ever of the distinguished name he inherits from his illustrious father." Edward Forbes also, in his address as president of the Geological Society, made the following further allusion: "Every student of Indian geology will be delighted at the appearance of the Himalayan Journals of Dr. Joseph Hooker, a work that will do much to sustain the reputation of the British School of Natural History. The geologist will find in it a rich store of facts of the highest interest, and for the inquirer into glacial phenomena it abounds with new and valuable data."

If still further testimony were wanted to the high merits of Dr. Hooker as a naturalist, it will be found in a letter of date 11th December, 1850, addressed by Baron Humboldt to Sir William J. Hooker, and published in the "Journal of Botany." "Six days ago," wrote that illustrious *savant*, "I received an admirable letter from your son, containing a perfect treasure of important observations relating to the mountain masses of Himalaya, their geology, meteorology, and botanical geography. What a noble traveller is Joseph Hooker! What an extent of acquired knowledge does he bring to bear on the observations he makes, and how marked with sagacity and moderation are the views that he puts forward! I can neither part with such a remarkable letter, nor keep to myself the *résumé* which it contains of his researches in Thibet and on its confines, therefore I desire that it should be published, and correctly published, in England. . . . I feel no little pride in being known to enjoy the friendship and correspondence of your son. When he returns to us in spring, he will find his own fame widely diffused and solidly based."

We should have mentioned before that Dr. Hooker lectured from the Botanical Chair in the University of Edinburgh, in 1845, for Professor Graham, and that on the death of that gentleman he became a candidate for the vacant chair. After a severe contest, his opponent,

Dr. J. H. Balfour, secured the appointment. In 1846 Dr. Hooker was appointed Botanist to the Geological Survey; and in this capacity he contributed a valuable paper to the Memoirs of the Survey, entitled, "On the Vegetation of the Carboniferous Period as Compared with that of the Present Day." This paper deserves the careful study of all fossil botanists, and will be found in the second volume of the "Memoirs."

In this sketch the interesting circumstance deserves to be noted that, after his return from his eastern travels, Dr. Hooker married the eldest daughter of the Rev. J. Stevens Henslow, Professor of Botany at Cambridge.

The materials at the command of Dr. Hooker for a work on the botany of India are very large. In conjunction with his friend Dr. Thomas Thomson, such a work was indeed undertaken, and under the title of "Flora Indica," one volume has been published. The intention of the authors to continue the work was at the time notified, the one in the Hookerian Herbarium at Kew, the other at the Calcutta Botanic Gardens; but so great is the expense attendant on the production of such a work that it will be almost impossible to proceed with it, unless under Government patronage and encouragement.

On scientific errands repeated visits have been made to the Continent by Dr. Hooker. In the autumn of 1860 he took a short tour in Syria, in company with Mr. Hanbury, F.L.S., during which he paid especial attention to the oaks of that country, in the hope of being able to throw some light on their very intricate and confused history. The result of the investigation was given to the Linnæan Society, on 20th June, 1861, in a paper on "The Three Oaks of Palestine." In compliance with the wishes of several distinguished Arctic voyagers, Dr. Hooker drew up an account of the affinities and distribution of the flowering plants of the north-polar regions, which was also communicated to the Linnæan Society. The contributions of our naturalist to the transactions of that body from time to time have been numerous and valuable. We may name the papers by him entitled, "On the Plants of the Galapagos Archipelago," "On the Structure and Affinities of Balanophoræ," and "Illustrations of the Floras of the Malayan Archipelago and Tropical Africa." Dr. Hooker has also contributed largely to the "Journal of Botany," edited by his late father, and is the author of the article "Himalaya," in the "Encyclopædia Britannica." It is, however, impossible to enumerate all his various literary and other labours in the prosecution of natural science. As an authority, he is frequently referred to, and, as a trustworthy observer, widely quoted by other writers.

Connected with some of the first scientific societies, and constantly consulted about their administration, a juror at exhibitions, and examiner to the Apothecaries' Company, London University, and Army Medical Service, Dr. Hooker, as Director of Kew Gardens, has also to conduct a correspondence with all the public offices, with India and the colonies, on botanical and horticultural subjects, besides being answerable for the condition and management of the gardens.

His is a public position of much labour as well as of much honour. But we may safely assume that, guided by the example of his illustrious and lamented father, and with his own experience, unwearied industry, and large scientific acquisitions, neither the public interests nor the gardens at Kew will suffer in the hands of the present Director. Nor can we conceive that the British Association, in raising to the honourable post

of its president Dr. Joseph Hooker, "the eminent son of an eminent sire," shall have any cause to regret the selection which it has made.

YARMOUTH BLOATERS.

WE can trace back the history of the Yarmouth herring fishery to a date anterior to that of the Norman Conquest—there being records in existence to show that this fishery, among others, was subjected to legal supervision and regulation in the days of Edward the Confessor. A few centuries later the care of the clergy for the fishermen is evidenced by the fact that Herbert Bishop of Norwich, in the reign of William Rufus, built a church in the town of Yarmouth for their accommodation. In those old Catholic times fish was a general desideratum on fast-days, and the herring fishery flourished in consequence of the universal demand. By the time of Henry III., about the beginning of the thirteenth century, the Yarmouth herring fishery was known as the "worthiest in Europe." But though we may trace the herring as an article of food to a very remote antiquity, we cannot do the same with the bloater, nor does it at all appear when bloaters first began to be eaten, or who it was that first invested the herring with those sapid and savoury qualities which make the bloater, when eaten in perfection, so delicious. We have heard enthusiastic eaters declare that the bloater is an invention beyond the reach of art, and that its discovery must have been due to some fortunate accident, as in the case of Lundy Foot's snuff or Charles Lamb's roast pig!

But before eating your bloater you must catch your herring, or somebody must catch it for you; so, with the reader's permission, we will go on a short fishing trip. It is a mild evening in the middle of September, after a day of fair weather, with a steady gentle breeze blowing from the north. The lugger which awaits us lies, with a crowd of others, a little way out; and, jumping into a boat, we are not many minutes in getting alongside and boarding her. Then it is up anchor, trim sails, and off we go towards the deep sea. We have some dozen men on board, several of whom are not sailors by profession, or fishermen either, save during the herring season; but all are active handy lads and well versed in the business that has to be got through. Looking around us, we see a whole fleet of fishing vessels bound on the same expedition as ourselves, some already far out to sea, others following in our wake, and others again just about to start. The low sunlight gleams on their rusty sails, transforming them into sheets of flame, while their fitful reflections flash in broken splendour from the restless billows. But ere long the sun dips behind the dull land-level—the crowd of sails sink out of sight in the shadows of the gloaming, the surface of the sea grows black and dark, and the wild talk of the waves waxes louder as we get farther out into the open, and the breeze freshens.

So long as there is any daylight nobody thinks of shooting the nets, experience having proved that night is the fisherman's best opportunity; but darkness has no sooner set in than preparations are made for getting the nets overboard. Herrings are caught by means of nets suspended from the surface to the depth of some thirty feet, and having meshes not less than an inch in diameter. The nets are fifty yards long each, and ten or twelve in depth; and the object being to make a wall of net in the water of as great a length as possible to intercept the fish in their progress, the nets are joined

together as they are shot, and being weighted at bottom and buoyed at the top, present one unbroken barrier for the whole of their united length, which is often a mile or more. The mesh is large enough to admit the head of an average herring, but not the body; thus fish of a small size get through and escape, while the full-grown ones are detained by the net catching in the gill. Much alacrity is shown in getting the nets into the water as soon as all is ready, and the motion of the vessel has been sufficiently retarded by taking in sail—the men paying them out with striking rapidity, while the slow track of the lugger is marked by the floating buoys designating the position of the sunken snare.

Now follows a period of leisure, and if you choose you may wrap yourself in a boat-cloak and go to sleep for an hour or two, as many of the hands are doing. The skipper, you may note, is wide awake; he is in fact on the look-out for indications of fish, the presence or the absence of which his practised eye is skilful in detecting. By-and-by he signals one or two of the hands, who, at his direction, haul up a small portion of the net, by the appearance of which he is able to judge whether he has made a fortunate cast or the reverse. If, after an hour's waiting, the net came up blank, he would probably haul the whole in again and proceed to another ground. But such is not the case now—those silvery sparkles that shone out of the dark water were a suggestive sign of what is going on below, and he is well content to await the event.

There is a faint glimmer of dawn in the east when the hauling in begins, and soon all hands are busily engaged in the work, and are moreover in high spirits at the sight of the "take," which is far beyond their expectations. Some parts of the net come up like a shimmering sheet of silver, being so crowded with fish that it seems a wonder they were not rent asunder. In other portions there are comparatively few, and in one place the net has been torn by the dog-fish, and numbers of the herrings mangled and destroyed. Such damage is too common to excite much remark, fisher Jack being little given to comments merely verbal, and contenting himself by knocking Mr. Dog-fish on the head whenever he can catch him. Hauling in a full "take," if an interesting process, is rather a slow one: every fish has to be extricated from the net as it comes over the side, and as fast as they come they are deposited in the "swills" with a plentiful sprinkling of salt, and stowed away below or on deck. It is broad daylight long before the whole of the nets are on board, and now, crowding as much sail as we can, we run for Yarmouth sands by the nearest track.

Arrived at Yarmouth, the herrings are taken on shore without loss of time, and if they are not already the property of some contractor or fish-curer, are submitted at once to public auction, the sale taking place either on the open sands or at some well-known sale-room. At the beginning of the season prices will run high, and a good proportion of the catch will be bought by the local dealers and hawkers, who will retail them for consumption while they are yet fresh. Also a certain proportion will be salted or pickled as white herrings—the cheapest form in which herrings find their way to the market. But the herring for which Yarmouth has been famous almost from time immemorial, is the "red," or smoked herring, an article known and appreciated throughout the whole civilised world, but only known in perfection by those who have eaten the Yarmouth bloater in its best condition—for as surely as "the child is father of the man," the original red herring was the father of the unrivalled bloater. Let us see how the "reds" are

manufactured, after which the preparation of the bloater will present no difficulty.

Red herrings are intended to keep good for a whole year, and are thoroughly cured with that view. As soon as the fish are brought on shore they are carried to the fish-house, where they are heaped on the stone floor to

comes the critical business of smoking: fires of wood in a green state are lighted on the floor, the wood most preferred being oak, though beach, ash, and elm are sometimes used; the fire must not be too quick or too slow, and needs to be well watched and regulated. To facilitate the smoking process the tiles of the roof are

YARMOUTH QUAY.

the number of tens or hundreds of thousands, and are plentifully salted. Here they lie for many days, until thoroughly saturated with the salt, and till all superfluous moisture has drained from them—the floor of the place being inclined for that purpose. When ready for the “hanging” process, they are shovelled with a wooden shovel into a large vat of water, and well washed, to cleanse them from the salt, scales, and dirt. As fast as they are cleansed they are taken out of the vat by women, technically called “rivers,” whose business it is to hang them on the “spits” for smoking, which operation they perform with wonderful celerity. The spits are round rods made of fir, about four feet long and a little pointed at one end; the point of the spit is inserted under the gill of the fish and comes out at the mouth, and in this way the fish are spitted at the distance of about two inches apart (so that no one fish touches another) until the spit is full. So soon as they are filled the spits are passed on from hand to hand to their proper places in the firing or smoke-house, which is a room, or series of rooms, about sixteen or eighteen feet square, and from twenty to thirty feet high, and filled up with wooden fixtures on framework supported by joists, for the reception of the spits. When the spits have been laid tier above tier, until there is no room for more, the tails of the lowest tier of fish will be about seven or eight feet above the brick floor. Now

laid so as to allow the smoke to escape, and there are ventilators under the eaves which can be opened or shut at pleasure.

The “reds” for home consumption require to be smoked for about twenty days, while those intended for exportation should be smoked for ten days longer. When the allotted time has expired the fires are extinguished, the house allowed to cool, and in a few days the cured fish are ready for packing in barrels. The packer receives from his assistant six or eight fish at a time as they are drawn from the spit, and lays them on their backs in tiers round the bottom of the barrel, the heads close to the side staves, the tails meeting in the centre of the cask. When these tiers rise above the ends of the side staves the fish are pressed down and the upper layer is put on with the backs of the herrings uppermost. In this state they are left to settle down, and in a day or two have sunk into the cask sufficiently to allow of its being headed: when this is done the “reds” are ready for the market.

Such being the genesis of the red herring, what is that of the bloater? Well, the fact is that the bloater goes through all the processes applicable to the “red,” but not being wanted to keep for a year, or even for a month, he is “put through” with much more rapidity, more careful ceremony, and with a tender regard for ultimate results. Note, if you please, that the bloater

is selected for peculiar treatment because he is the *élite* of his class—the largest, handsomest, most fleshy and corpulent, in all respects the aristocrat of the herring tribe—the only real specimen, in fact, of the “bloated aristocrat” to be found in the whole domain of natural history. Look at him as he lies in the dish tempting your morning appetite; mark his rich colouring, rivalling that of an ancient master—the deep olive tones on the back, the metallic brilliancy of the sides softening into a creamy hue in his under parts. Then what a fragrance he exhales as you lay him open, and hasten, at the instigation of your salivary glands, to pay him the posthumous honour to which he is so richly entitled.

We need say no more. The reader will understand that the fine qualities of the bloater are due in the first instance to his superior personal merit, and in the second to the prompt and delicate treatment he receives at the hand of man. So prompt, indeed, is the treatment, that upon occasion, when the demand is urgent, the whole of the several processes are completed in the space of ten or twelve hours, so that the herring who is joyously disporting himself to-day in his native sea shall figure to-morrow as the choicest viand of the breakfast table.

As an article of commerce, the bloaters are not crammed into barrels and sent across the seas. Rather are they laid loosely together in osier baskets containing a dozen or two each, and despatched by the quickest conveyance to the happy recipients. We must not forget to add, that to be enjoyed in their finest perfection they should be eaten at Yarmouth, while yet reeking from the smoke-house.

MY FIRST CURACY.*

CHAPTER I.—SEARCH AFTER A CURACY.

A FIRST curacy, I have always held, is the most important step that can be taken in a clergyman's career. The stamp of his first curacy generally remains upon him during the whole of his ministry, and his after administrations are certainly much influenced by the circumstances of his earlier ones; indeed, his whole tone is tinged through life by the associations he forms in the first years of his ministerial office. Hence, then, the great importance of a careful choice in the matter.

Sometimes a sphere of labour opens naturally; at other times it is a source of great difficulty to know which branch in the ministerial office to choose, or for what particular field of pastoral work the candidate for orders is most suited. Of course there is a certain amount of risk to be gone through, for a man can never know positively that he is qualified for any particular post until he has attempted to fulfil its duties. Having, however, some general idea of what post is most likely to suit his peculiar individual temperament, the next thing to ascertain is also a very important one, namely, the disposition and character of the rector or vicar under whom the young minister will have to work. Much of the success or failure of many a man's subsequent ministry depends upon the direction and bent given him at first starting. Men are generally totally inexperienced when they enter the ranks, and therefore, unless they have a fit and judicious officer, they are liable to commit many serious errors of judgment, to say and do inexpedient things.

But above all other considerations, should unison in matter of doctrine be carefully ascertained before a

compact is concluded between the intended vicar and curate. If diversity of opinion in vital points is afterwards found to exist, how painful to the feelings of both will be the discovery! The usefulness of both will be greatly impaired, their influence will be nullified, and the parishioners suffer, in consequence of this lamentable dead lock in doctrinal matters. It is perfectly necessary for the well-being of a parish, that not only should its clergy pull together, but in the same direction; if they do not, disagreeables are sure to arise which must end in unpleasantness on both sides, and in injury to the people. A personal interview is, in my opinion, the easiest and readiest way of obviating such a difficulty, for in half an hour's conversation, more mutual agreement, or the contrary, will be found, than can be discovered by a dozen lengthy letters.

In my own particular case, I did not wish to work with what is called “an extreme man” of any kind. If the Church of England were to be divided into several distinct sections, it might be necessary to make a distinct choice; but I cannot approve of every particular detail in any of the so-called “parties,” and I wished in my first curacy to have some liberty to act upon my own conscientious views, within the limits of what I believed to be according to the word of God and the standards of the Church.

I felt myself also obliged to be rather careful concerning the size and population of the parish in which I was to work; for while, on the one hand, I did not desire a very restricted field for what energies I possessed, on the other, my health not being strong, I did not wish to be completely overwhelmed with the amount of duty required from me all at once. Some of my readers may fancy that I am somewhat fastidious when I go on to say, that I was rather particular as to the locality of my future scene of labours: I objected to the extreme north or south, nor did I wish to be whelmed in by coalpits on every side, or to bury myself in complete rural retirement.

Yet in the end, one of these conditions was my lot for the first seven eventful years of my ministerial life.

Having then settled in my mind what I considered I wanted, and for what post I thought I was fitted, I inquired among my friends, and stated my wants to my few clerical neighbours. These all kindly promised to look out for me. Now this “looking out” generally ends in no satisfactory result—at least I found it so in my own case, and I do not think mine was a peculiar one. It is the usual way of getting rid of a troublesome consultation about any situation or office, to say, “Oh, I will look out for you.” At the moment, the intention may honestly be to “look out,” but in the multitude of other concerns the promise is forgotten, and the applicant is left to look out for himself. So at last, being tired of waiting for answers from my friends which never came, I began to take in the clerical papers. I pored over the advertisements in the “Record” and the “Guardian,” and the “Ecclesiastical Gazette.” I answered numbers of advertisements in these and other clerical papers, but they all came to nothing.

At last I resolved myself to advertise, and having procured the services of a friend who was considered a capital hand at such things, he wrote my advertisement as follows:—

“Wanted a Curacy, with title to Orders for the September Ordination. The advertiser possessing small private means, stipend required £60 a-year. Views in strict accordance with the Prayer-book. Experienced in Sunday Schools, Evening Adult Classes, &c.”

This advertisement brought me no less than thirty-

* The writer, now senior curate in a large London parish, thinks that his early experience may be useful to some of his younger brethren, as well as interesting to general readers.

three replies! I was perfectly bewildered with them. But the variety of work required, the curious questions asked, such as "Is your health good?" "Are you a gentleman?" "Do you sing?" "Are you married?" "Are you active?" "What 'private property' have you?" The replies demanded by return of post, with lists of references, completely overwhelmed me.

Now, I had only four clerical references, so I could not, of course, give them to all the thirty-three incumbents desiring them. My friends were good natured, no doubt, but I could scarcely expect them to write and post thirty-three testimonials in my favour; so the plan I fixed upon was this: I picked out six of what I considered the most likely curacies to suit me, and wrote polite answers to the remaining incumbents, thanking them for their replies to my advertisement, and stating that I was already in treaty, but that if I failed I would immediately open a correspondence with themselves. I took this trouble mainly because I think it is only due as a matter of courtesy from one gentleman to another. Now some of these answers to my advertisement were, as I have already hinted, extremely amusing. I will therefore transcribe a specimen of some of them, for I have kept the originals still by me, though it is now a good many years since I received them.

One incumbent wrote: "I require a curate to take the entire charge of two small parishes: there are two churches, they are two miles apart; there will be four schools for the curate to look after, and all the sick and poor will have to be visited. I regret to say that, owing to my living being small, and myself in indifferent health, I cannot come up to the terms required in your advertisement, but I should be happy to offer you £30 a-year!" This incumbent added in a postscript, "In bad weather in the winter season, I generally lend my curate my pony to ride between the two churches on the Sunday."

Another vicar wrote from the wild districts of Northumberland, "You are just the man I want. I think we shall get on well together. I reside in the parish and do half the work (population 2,300); but I shall want you to go over every Sunday afternoon to a distant hamlet, and take a service in a school church I have erected there: the distance is a little more than four and a-half miles. I may as well mention that I cannot give you £60 a-year, but I dare say you would accept £45."

I did not accept the £45, nor did I relish the idea of a walk of nine miles, winter and summer, in the afternoon, after taking my full share in the morning duty, and being expected, I suppose, to do the same in the evening, in the parish church, upon my return.

I have previously stated that I had reserved six of those answers to my advertisements most likely to suit me; these, from circumstances over which I had no control, dwindled down to four. I may as well mention that at this time I was residing in the south of England, and this fact decided me to write to an incumbent in Somersetshire, saying that I would come and look at his parish, it being the nearest in point of distance to my temporary home.

Having received a cordial assent to my request, I started the following morning by an early train, and in due time arrived at the indicated station. On the platform I met a farmer-like looking fellow, with high yellow skin gaiters, dressed in a rough shooting coat, carrying a stout walking-stick in his hand. "Are you Mr. C—," he shouted to me, as I got out of a second-class carriage. I replied that I was. "Well," said he, "I am the incumbent you want to see;" and then, giving me a hearty and rather heavy slap on the back, he added, "Those shoes won't do for this

country, you must get thicker ones." We soon started in a sort of dogcart of ancient build, and, after a pleasant ride through rather a flat country, we pulled up at a small but prettily situated house; at least the number and variety of the clusters of climbing roses on all sides could not fail to make it look pretty and cheerful in the summer season. This was the Parsonage; into which I was duly ushered, and soon introduced to two elderly grim-looking ladies.

"My sisters," said the vicar. I do not hastily judge persons by appearances, as the reader will allow, when I say that the non-clerical costume and manner of the incumbent had made no unfavourable first impression, but rather the reverse. The look and manner of the ladies, however, could not be mistaken. I confess my heart sank within me.

"I hope you do not care for society," said my host, as soon as he had assisted every one most bountifully at dinner. "I mention this because there is positively none for miles round." I replied, "I certainly did like a little, as I thought society enlarged one's ideas, which were very liable to grow contracted if left to feed upon themselves. The mind requires change and exercise for its health, as well as the body."

At this remark, the two old ladies looked at each other, then muttered something which sounded very ominously to my ears, and turned not the most pleasant countenances in the world upon your humble servant.

After our early dinner, to which the vicar did ample justice, he took me out to see his church, schools, and parish generally. The former was a really fine specimen of the perpendicular style of architecture; it was also in good repair, and what restorations had been done had been carefully performed. I tried my voice and found it suited the edifice.

We next went to the schools, which, being in the state of rebuilding, I could not say much about; but with the parish I was very much disappointed: it was perfectly flat, and half of the entire area, the incumbent told me, was under water nearly half the year. He also informed me, as another drawback, that Dissenters formed the majority of the inhabitants. In the evening the vicar was gaiety itself; but the conversation soon ended, and he proposed a game at long whist! My reply, I have no doubt, settled my unsuitableness with the ladies. Next morning, while thanking him for his hospitality, I declined the curacy; the water, the whist, and the ancient ladies, decided me in the negative.

The object of my second search lay in a beautiful part of the west of England. Having to remain at Gloucester for two hours, the trains not suiting, I resolved to go and see the cathedral. While looking over the splendour, I asked the attendant verger some questions about the village to which I was going, when suddenly he exclaimed, "You are not going to *that* place, surely?" These words were addressed with marked emphasis. I had scarcely time left to say that I intended doing so, when the chiming assured me I should have to run to catch my train, which I just managed to do. As I journeyed along, I ruminated upon the verger's words, and not in a very hopeful frame of mind reached the station nearest to my destination.

Here I had to wait some time, whilst a gig was being prepared to take me to the parish I was in search of, as I did not feel inclined for a very wet walk of five or six miles through unknown country roads. I was very wet and cold when I reached the parish, but the genial welcome of the rector and his wife, and a well warmed and brilliantly lighted room, soon made me feel at home and comfortable.

The rector was a true and perfect gentleman. His church was very pretty, and in perfect order, as was also the churchyard. I do not say that these outward things are proofs of similar care in regard to the living church and the spiritual vineyard; but I have found that where a church is dirty, and a churchyard in disorder, there is likelihood of carelessness or indolence in higher matters. I found that the schools were very badly attended, and though the parish itself was charmingly situated, yet, when its moral aspect was looked upon, it was most vile and depressing to one's feelings. During the course of our conversation I drew from the rector this significant fact, that, as soon as I was firmly located, he intended leaving the parish and myself to our fate.

Nearly the whole of the inhabitants had been drawn thither by some chartist, or other strange society, the idea being that everybody should possess his own acre of ground, his pig, his cow, and his cottage rent free, and that he should enjoy a life of rural contentment. Now the practical result of this scheme was not quite what its sanguine promoters anticipated, and finding it the fixed determination of the rector to leave me to fight my own battles, I declined the curacy.

I was now growing a little disheartened at this double failure in my search, but resolved to persevere. Accordingly, having received an invitation to visit the incumbent of a parish situated in one of the busiest parts of Lancashire, I went northward. I liked what I saw of the church, clergy, and schools, and was not prejudiced against what I saw of the people themselves. I had very nearly accepted the curacy, though a little distracted with the noise proceeding from no less than seven lines of railway running through the parish (indeed, the principal station was at the bottom of the parsonage garden), when I turned and asked the incumbent the extremely natural question, where I was to lodge. "Ah," answered he, "that is the difficulty: unless we can get the millowner to knock two of that row of workmen's houses into one, you will not be able to get lodgings nearer than N—," mentioning a large manufacturing town about three and a-half miles off, the only road to which was over cinder heaps, and along the side of blast furnaces.

I felt at once that I was not suited for this work. I remarked to the incumbent that it would have been but an act of justice if he had just mentioned this little fact about the difficulty of obtaining lodgings, as it would have prevented my taking a useless journey to the north, and saved me between £5 and £6, no small matter to a poor man.

I returned to my temporary home wearied in mind and body, and with my small means much straitened. I began to fear that I should not succeed in obtaining a curacy at all, in spite of the numerous answers to my advertisement in the first instance.

Growing rather reckless as to the position of my next search, I resolved to take any one that offered. Accordingly, I wrote to one of the remaining answers I possessed, when, in reply, I received an answer by return of post, saying that the whole of the references were personally known to the gentleman with whom I was in correspondence, and that he should be happy to close with me at once, as he was in immediate want of a curate.

I accepted his offer, though I rather objected to live in the parsonage with himself and wife. There was no family; but finding that there existed no alternative, as no lodgings could at the time be obtained, I had to assent, and accepted the curacy.

Varieties.

DOUBLE STARS.—In connection with our remarks on binary systems in last number, the following diagram exhibits a selected list of double stars, as seen in an inverting astronomical telescope. Some of them are, probably, only optically double, their apparent juxtaposition being the result of the two stars being seen from the surface of the earth in the same line of direction, or, if they be binary systems, their time of revolution must extend over a lengthened period. Castor, Epsilon Hydræ, Gamma Leonis, and 61 Cygni, have been proved to belong to the latter class of objects. Gamma Andromedæ is triple, the companion being easily resolvable into two components when viewed through a good defining telescope, especially when the star is at high altitude about sunrise or sunset. The list of known binaries exceeds a hundred, without including several double stars suspected to belong to a common gravitational system.

SPANISH CHARACTER.—The people of Spain, the so-called "lower orders," are superior to those who arrogate to themselves the title of being their betters. This may have arisen in this land of anomalies, from the peculiar policy of Government in Church and State, where the possessor of religious and civil monopolies, who dreaded knowledge as power, pressed heavily on the noble and rich, dwarfing down their bodies by intermarriages, and all but extinguishing their minds by inquisitions, while "the people," overlooked in their poverty, were allowed to grow out to their full growth, like weeds of a rich soil. They in fact have long enjoyed, under despotisms of Church and State, a practical and personal independence, the good results of which are evident in their stalwart frames and manly bearing. On the masses, the edifice of Spain's greatness is, if ever, to be reconstructed.—*Ford's "Spain."*

TREES OF MISSOURI.—Professor Swallow, of the Missouri Geological Survey, gives the following actual measurements of large trees in South-east Missouri:—The largest is a sycamore in Mississippi County, 65 ft. high, which, two feet above the ground, measures 43 ft. in circumference. Another sycamore, in Howard County, is 38½ ft. in diameter. A cypress in Cape Girardeau County, at a distance of one foot above the ground, measures 29 ft. in circumference. A cottonwood in Mississippi County measures 30 ft. round, at a distance of six feet above the ground. A pecan in the same county is 18 ft. in circumference. A black walnut in Benton County measures 22 ft. in circumference. A white oak in Howard County is 26 ft. in circumference. A tulip tree (poplar) in Cape Girardeau County is 30 ft. in circumference. There is a tupelo in Stoddard County 30 ft. in circumference. There is a hackberry in Howard County 11 ft. in circumference. A Spanish oak in New Madrid County 26 ft. in circumference. A white ash in Mississippi County is 16 ft. in circumference. A honey locust in Howard County is 13 ft. round. There is a willow in Pemiscot County that has grown to the size of 24 ft. in circumference and 100 ft. in height. Mississippi County boasts of a sassafras that must be king of that tribe; it measures 9 ft. in circumference. There is a persimmon in the same county 9 ft. in circumference. In Pemiscot County there is a dogwood 6 ft. in circumference. In Mississippi County papaws grow to a circumference of 3 ft., and grape-vines and trumpet creepers to a circumference of 18 in. to 22 in.

THE ESCAPE FROM THE WRECK.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER VIII.

"Cut away the masts—the shrouds first—be smart, my men!" cried a voice.

"Who dares give that order?" shrieked out the captain; "she'll be over this in no time."

"I dare obey it," exclaimed one of the seamen. "Come, lads, it's the best chance of saving our lives."

The men listened to the advice of their messmate, and knowing where to find the axes, quickly severed the shrouds of the mizen-mast, and some attacked it, while

others went to the main-mast, in spite of the mad cries of the captain to "hold fast." Their object was thus to force the ship over the reef, if it was a reef we were on, head first, or closer to the shore if we were on an island. The seas came thundering against our sides, often dashing over the decks, so that with difficulty any of us could save ourselves from being carried away by them. Several poor people were thus swept away soon after the ship struck, and their despairing shrieks rang in our ears as they were borne away, or hurled on the rocks amid the foaming breakers. We could see nothing beyond the ship except the troubled waters. Our chief

hope rested on her not being wedged in the rocks. Now she lifted and drove on her bottom, grinding over the coral; now down she came again, and rocked to and fro in the surges. Directly the after masts were cleared away, her head paid off, and we drove on stern first. It was pitiable to hear the cries which rose from the terror-stricken passengers, but as we could as yet give them no comfort I refrained from going below. William and Trundle, O'Carroll and I, stood together holding on to the stump of the main-mast; the Frenchman and his son had gone below at the commencement of the gale. I hoped that they were still there. The ship continued alternately grinding and bumping along, but still evidently progressing over the reef. She must have been new and well built, or she would have gone to pieces with the treatment she was receiving. Our anxiety was thus prolonged, for it was impossible to say, supposing the ship should drive over the reef, whether we should find land, and if not whether she would float. It seemed as if each blow she received must be knocking a hole through her planks. Oh, how we longed for daylight, at all events to see and face the dangers which beset us! In the dark we could do nothing, but hold on for our lives, and pray that we and all with us might yet be preserved from destruction.

At length the ship was lifted by a huge wave. On she drove. It seemed that the next time she came down on the hard rocks it must be to her destruction. On, on she went—the waters roared and hissed around her. Instead of the expected catastrophe, suddenly she appeared to be floating with comparative calmness; she had been forced over the reef, but the furious wind was still driving her before it.

"We should anchor this instant," said O'Carroll, but neither the master nor his mates were on deck to give the necessary orders. "Stand by to anchor," cried O'Carroll.

The two midshipmen, with Kelson and several of the crew, hurried to carry out the order. Some delay occurred in consequence of the darkness. At length the anchor was let go, but as the ship's stern swung round, it struck heavily on a rock. Again cries of terror came up from the passengers in the cabins; I therefore, as I could be of no use on deck, went below, in the hopes of tranquillising their minds. They clung round me as I appeared, entreating to be told the truth. I assured them that there was no immediate danger, and that though the ship had again struck on the rocks, there was so much less sea inside the reef than what she had already gone through, I hoped she might continue to hold together. In all probability we were not far off land. Some, on hearing this, especially those who had been most overcome with terror, expressed their joy in all sorts of extravagant ways, and seemed to consider that there was no longer any danger to be apprehended; others, again, would scarcely credit what I told them, and inquired what the captain thought on the subject.

"The captain! what does he know about anything?" exclaimed a young man, who appeared to be superior in education to most of the passengers. "If the ship is lost and our lives sacrificed, on him will rest the blame—look there."

He threw open the door of the captain's cabin, where he and the first mate sat, both far too tipsy to move, yet still trying to pour spirits down their throats.

"What's that you say?" growled out the captain, with an indistinct utterance; "I'll have no mutiny aboard this ship."

"He endeavoured to rise, but fell forward across the table, upsetting the bottle and tumblers. The mate

was too far gone even to attempt to rise. He gazed at us with an idiotic glance for a minute or two, then his head dropped down on the little table at which he was sitting. It must be understood that all this time the ship was far from quiet: she was still grinding and striking heavily against the rocks, though the sea had not sufficient force to lift her over them. I hurried again on deck: my fear was that the ship would fill with water and drop off the rocks and sink. After hunting about we found the carpenter, and with his help sounded the well; already there were six feet of water in the hold. After waiting a short time, we found that the water was increasing; the pumps must be set to work. Some of the crew said it was of no use, and refused; others came to our summons; and to help us, we called up all the men passengers, while we set the example by labouring as hard as we could; thus the night passed. It was indeed better for everybody that we had something to do. Dawn came at last. We eagerly looked out for the prospect which daylight was to reveal, whether we were to find ourselves amidst reefs just rising from the water, or near a mere sandbank, or on an inhabited shore. At first we could only see, as before, the white foam dancing up; then dark rocks and yellow sand, and beyond it brown hills and a few trees. As the light still further increased, we discovered that the country was in a state of nature: in vain we looked for traces of inhabitants.

The passengers, hearing that we were close to land, came crowding on deck, all eager to get on shore. It was, however, no easy matter to do so. The sea came rushing round the ship, between which and the dry rocks the distance was considerable, so that anybody attempting to swim to them would have been swept away. One small boat alone remained, the rest had been knocked to pieces; in this only two rowers could sit, and a couple of passengers at the most. As far, however, as we could see on either side, the surf broke too furiously to allow her to land, so that she could, we feared, be of no use. At length, my brother cried out, "We'll go in her; there is one place just inside the ship where we can jump on shore with a line; if we can do that, we'll carry a hawser to the rocks, and all the people may land." The two mids and Kelson agreed to go in the boat, towing a light line. We watched them anxiously. The water tossed and foamed around them, and they had hard work to contend with the reflux of the sea. Earnestly I prayed that they might be protected and succeed, both for their sakes and ours. A shout of joy and thankfulness burst from the lookers on, as Kelson leaped on the rock, followed by the two midshipmen, who instantly hauled the boat up out of harm's way. A hawser had been prepared, which they at once hauled on shore and secured; a cradle was next fitted to it by the seamen, under O'Carroll's directions. It was a question who was to go forth to prove it; at that moment, Jacotot made his appearance on deck. He was told that he must go on shore. He was secured forthwith to the cradle. In vain he struggled and protested: he was quickly drawn across. His son and Jack followed. Two men then went to assist in hauling the passengers across; they were placed one after the other in the cradle, and landed in safety. I was thankful when they were all on shore. There they stood, grouped together, gazing helplessly at the ship, not knowing what to do. There was no one to guide them. Those wretches, the master and his mate, still remained utterly helpless in the cabin. Half the crew of the ship had been lost, and the young mate, who might have exercised some authority. From what I saw of the remainder of the

crew, I was afraid that they were mostly a very bad set. I dreaded their breaking into the spirit room, which seamen often do under such circumstances. To prevent this, it was necessary to keep them amply employed: we urged them, therefore, to land all the provisions that could be got out the hold.

To expedite this proceeding, we got another hawser carried on shore. Our lives might depend on the amount of provisions we could save. All day we worked on, till towards evening the water had risen so much in the hold that nothing more could be got out. The heat was intense, but so important was the work, that we scarcely stopped even to take food. No one had thought all this time of the captain and mate, the real cause of their misfortunes. Suddenly I recollected that they had been left in a side-cabin asleep. I hurried down. I was but just in time: the water was up to their heads, and in another minute would have washed over their faces and drowned them as they lay sleeping off their debauch. I shouted out their names, and called them to come on deck. They started up, their countenances exhibiting their horror and alarm, as they believed that the ship was sinking beneath them. Out into the water they tumbled. The mate slipped, and caught hold of the captain to save himself. Over they went, struggling together. I fancy that they thought themselves overboard; right under the water they dragged each other, once more to get their heads out, spluttering and shouting, and swearing most fearfully. At last, fearing that they might after all be drowned, I seized the mate, who was the smaller man of the two, and dragged him on deck, calling out to O'Carroll to assist in getting up the captain. He came to my assistance, and we hauled both the men on deck. Their sea bath and the struggle had brought them to their senses; but when, after staring around for some time, they saw that the ship was a hopeless wreck, cast away on an apparently barren island, they very nearly lost them again. To find fault with them at such a moment would have been folly. "Come, I advise you to get on shore, for very likely the ship will go to pieces during the night, if the wind rise again," I said, quietly. They were far from disposed to thank me for my advice, though, after looking about for a few minutes, they took it, and were hauled on shore. After collecting everything of value to be found in the cabin, compass, charts, and some nautical books, I followed. O'Carroll was the last man to leave the ship. William and his messmate had been very active on shore, and got a tent rigged for the poor women and children, and some food cooked for them by Jacotot.

No sooner was a fire lighted than the Frenchman was himself again, hurrying about in search of the utensils necessary for his calling. He had cooked a capital supper for them, and he now offered to cook one for us. On collecting all the sails we had landed, we were able to form a shelter for ourselves, as well as for the seamen; and at length, weary with our exertions, we lay down to rest. The captain and mate were very silent, and I hoped ashamed of themselves. During the night there was a good deal of wind and sea. I was thankful that we were on shore, and when I looked out I almost expected to find that the ship had gone to pieces. There, however, she was, still holding fast together. Seeing this, the captain declared that he would get her off, and that if trees could be found in the island suitable for new spars, he could proceed on his voyage.

"If he knew of the bumping she got he wouldn't say so," observed O'Carroll. "That ship will never float again, and strong as she is, another gale such as we had last night will break her to pieces."

As there was nothing more to be done, we started to explore the island. It seemed to be the chief of a group of rocky islets, being about six miles long and half as broad. Though we made diligent search as we walked on, we could find no water. A few small casks of the precious liquid had been landed, but sufficient only for another day or two.

"And what shall we do when that is gone?" asked William. It was a serious question.

"We must trust in God, for vain is the help of man in such a case," I answered; "at all events, we must use what we have got with the greatest economy."

On returning to the camp and reporting our want of success in finding water, what was our dismay to find that every drop in the casks had been consumed! All the poor people could say was that they were so thirsty, and the children were so constantly crying out for water, that they could not help giving it to them. We were ourselves already suffering greatly from thirst after our ramble, yet not a drop of water did we obtain. Our lips were parched, our tongues dry: without water we could not eat, we loathed food, supperless we lay down to sleep. All night long I was dreaming of sparkling fountains and running brooks. As soon as it was daylight, we again set out with a spade and pickaxe, prepared, if we could find no running stream, to dig wherever verdure showed that moisture was at hand. We walked on and on, searching in every direction round the shore, but no sign of a stream emptying itself into the sea could we discover, and when we dug we soon met the hard rock. Faint and weary we returned to the camp. We found a fire blazing, and Jacotot with several men standing round it: two were working a rough pair of bellows, others hammers and tongs. All were employed under his directions, while he was engaged in riveting a pipe into a large copper kettle.

"Why you trouble to look for water?" he asked. "There is salt water, there is wood to make fire, then we have plenty of fresh water. We make steam, steam come out and leave the salt in the kettle, and then find a cold piece of iron and drop, drop, down into this tub all fresh and good for drink." He told us that he had seen a French doctor obtain fresh water from salt in that manner.

"Most men have their merits, if we could but discover them and put them in their right places," I thought to myself. "We were inclined to laugh at Jacotot, but if he can produce fresh water out of salt, he may be the means of saving all our lives."

We watched him anxiously, all eager to help him, but he would not be hurried. At length the machine was finished, and we hastened to fill it with salt water. It was placed on the fire, and slowly the drops of fresh water were distilled from it. How eagerly were they sought for by the poor creatures who stood round with lack-lustre eyes and parched lips. Jacotot insisted that the youngest should be served first. I think he was influenced by the wish to get his boy Auguste an early draught. That was but natural. Some of the crew grumbled, and so did the captain and mate, who were, in consequence of their late debauch, suffering fearfully from thirst; but O'Carroll, William, and Trundle, Kelson, and two or three of the passengers, formed a body-guard round the Frenchman, to enable him to do as he thought right. Only half a little liqueur glass of the precious fluid was served out to each person. It was pleasant to see the eyes of the poor children brighten as the pure water touched their lips. The younger ones, however, directly their allowance was

gone, cried out for more. Several times we had to stop till more water was distilled.

While we were thus engaged, the wind had again got up, and the sea, dashing over the reef, began to burst with violence against the shore. The effect produced on the wreck was soon apparent. The remaining upper works began to give way. As the sea rolled in with increasing violence, plank after plank was torn off, then larger portions were wrenched from the hull, the deck burst up, and was soon dashed into pieces against the rocks. As soon as we had swallowed enough water somewhat to slake our burning thirst, we hastened to the beach to save what we could from the wreck. We hauled on shore all the planks and timber we could get hold of, with the vague idea that we might be able to build a raft of some sort, in which to make our escape. At all events, the wood would be useful to construct huts for the women, or to burn. As darkness set in, a large portion of the wreck had disappeared, and even the captain was convinced that her keel would never leave its present position, except to be cast up in fragments on the rocks. He and the mate had been very quiet and low-spirited. They were craving for their accustomed stimulants, and several times I heard them grumbling at us for not having landed any liquor for them. Neither they nor the larger portion of their crew had exerted themselves in the slightest degree to assist us in our labours. Most of them sauntered along the beach with their hands in their pockets, or sat coolly watching us. Fatigued with our exertions, we at last returned to the camp, where Jacotot was able to give us a glass of water, and we then, thankful even for that small supply, lay down to rest.

It was not till late that any of us awoke; we then found that the captain and mate, and several of their men, had withdrawn themselves to a distance from the camp. We were glad to be rid of their company, though why they had gone away so suddenly we could not tell. We could not help suspecting, however, that they had done so with the intention of hatching mischief. When I speak of *we*, I mean our party from the *Doré*, for we of necessity kept very much together. I have not particularly described the emigrants, for there was nothing very remarkable about them. Two or three were intelligent, enterprising men, who had made themselves acquainted with the character of the country to which they were going, and had tolerably definite plans for the employment of their capitals. The rest had mostly failed in England, and were rather driven by want into exile than attracted by the advantages the new colony had to offer. They were all married men with families, and this made them associate with each other for mutual assistance. The steerage passengers were generally small tradesmen, and had emigrated for much the same reason as the others. Three gentlemen of the first class, who were bachelors, had begged leave to join our mess. One of them had already been in New South Wales, and was able to give us much interesting information about it. So much taken was I, indeed, with what I heard, that I resolved, should I be unable to find the Barbara, to visit the colony before returning home. We thus, as I have explained, formed three chief messes. We were not as yet either very badly off. We had saved provisions from the wreck sufficient, with economy, to last us a couple of months or more; and now that we could obtain fresh water, though but in small quantities, we were not afraid of dying of thirst. We were in hopes, too, of finding turtles and turtles' eggs, and perhaps wild fowl, and we might also catch fish to add to our stock of provisions. Could we only find water, and some sort of vege-

tables, we might be able, we thought, to support existence for any length of time; and as far, indeed, as we could judge, we might not have an opportunity of escaping from the island for months, or it might be for years. This was not, however, a subject pleasant to contemplate. I thought of my merchandise, William of his promotion, and of the opportunities he might lose of distinguishing himself, while Jacotot, though not idle, was unable to make money where he was. Toby Trundle, however, took things very easily. He laughed and joked as much as ever, and declared that he never was more jolly in his life. He used to say the same thing in the midshipman's berth; he had said it on board the boat, and I believe he would have said it under nearly any circumstances in which he could have been placed. The poor emigrants, on the contrary, were very far from content. Most of them had lost all they possessed in the world, and knew that, should they even ultimately arrive at their destination, they must land as beggars, dependent on the bounty of others. They were therefore naturally very loud in their complaints of the captain and his mate, while they were continually bewailing their own hard lot. Those persons had, as I observed, removed themselves to a distance from the rest of our shipwrecked band.

We had retired to tents for the night, and had laid down to sleep, when after some time I was awoke by sounds of shouting and laughter, followed by shrieks and cries, which seemed to come up from the beach where the captain and his associates had taken up their quarters. The noises increased, and O'Carroll awoke. He got up, and we went together to the entrance of our tent. The night was very calm. The stars shone forth from the dark sky with a brilliancy I have never seen surpassed; even the restless sea was quiet, and met the shore with an almost noiseless kiss; all nature seemed tranquil and at rest. A shot was heard, and then another, and another, followed by shouts and execrations. "There will be blood shed among those madmen," exclaimed O'Carroll. "They have got hold of some liquor unknown to us, and are fighting with each other: we must try and separate them." Calling my brother and the rest of the party to come to our assistance, we hurried off in the direction whence the sounds proceeded:

CHARACTERISTIC LETTERS.]

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

EDWARD FORBES.

I HAVE offered my genial tribute to the memory of Edward Forbes in the volume above referred to. His "Life" has been compiled and published, and innumerable memoirs and biographical notices have appeared; but all together fail to afford an adequate idea of him. So zealous in scientific pursuits; so various as well as recondite in his acquirements; so sportive in some of his researches, as if the hard labour were sheer fun; so gifted with taste in the fine arts; so well read in general literature and antiquities; so clever with his pencil; so ready with his pen; so humorous and so good-humoured; so playful, so judicious, so instructive, so entertaining, as the occasion "ruled the hour," none but himself could be his parallel.

The most distinct and prominent feature in the character of Edward Forbes might be described in one word, only that the word has been degraded to a very different meaning—he was a thorough socialist. From his first days at school to his latest day, amid the prose-

cution of intense studies, he was always forming brotherhoods; some for useful practical purposes and improvements, and others for recreation after hard mental labour, in the enjoyment of frank and festive communion with congenial minds. Dr. Johnson would have called him a most "clubbable" man. At all events, the Institution of the Red Lions was a climax to this order of organizations; even when most playful, shooting follies as they arose, and using wit and satire on the side of sound sense and useful knowledge.

The history of the Red Lion Club may be briefly told. The formal or official entertainments at the meetings of the British Association had become prolix and wearisome, and still more disfigured by fulsome compliments, which every postprandial speaker bestowed (as is too commonly the custom of England) upon every other speaker. A chance congress of three or four of the younger savans, on a stroll, at a roadside inn, led to the establishment of the Red Lions, radiant from its sign! Instead of attending the ordinaries or grand dinners, they made occasional days of escape, and dined *en clubbe*, as the French journal translated it, in parties of ten or twelve, Edward Forbes usually presiding. The dons pooh-poohed the club for awhile, but by degrees it made itself known, and so grew that it became difficult to decide whether the B.A. was attached to the R.L., or the R.L. was an offshoot of the B.A.!

With this needful preface, I proceed to my Letters, selecting, to begin with, one or two bearing upon the subject in hand, from a mass of correspondence in which many epistles were, like these, characteristic as being half prose and half verse.

At the British Association at Birmingham, in 1839, the Friday set apart for excursions turned out as wet and stormy a day as ever tried the nerve of philosophy. Nevertheless, about three hundred members attended their leaders, Murchison and Buckland, to visit Horsley Ironworks, the Lime Caverns, Wren's Nest, and Trap formations. Forbes's notice thereon follows:—

West Lulworth, near Wareham, Dorset,
27th September.

DEAR JERDAN,—You should have had the song sooner, but the Beroe had dived so deep among my shirt collars and small clothes, in the hurry of packing up after the tenth campaign (not champagne) of the Red Lions, that there was no getting him to the surface. However, here he is, and you may press him to death, if you think him sufficiently decent and musical. (*Here follows Song of the Beroe.*)

Wandering away in these desolate and benighted parts, I have not yet received any of the accounts of the Association, but shall do so in due time, when parcels come. What you say respecting blustering and begging I quite agree to. When will the old *staggers* of the Association learn to give up the dramatic and do the scientific?

I would write a song about "Garibaldi," but with all his faults I love him, for he is a thorough right-hearted man at bottom.

By this time I hope you have got over the dreadful foreglimpse of the sulphureous cavern where I was nearly throttled.

Ever, dear Jerdan,
Very truly yours,
EDWARD FORBES.

Then follow the verses on—

THE DUDLEY EXPEDITION: A BRITISH ASSOCIATION MEDLEY.

Tune—"Going to Putney by Water."

Come, listen all as members be,
Whether of sections A, B, C,
D, or else of E, F, G,
As go to Dudley by water;
As how from Brummagen we set,
Upon one Friday very wet,
To gather stones and fossils get,
All at Dudley by water!

Skipping, dripping all the way,
Lots of swim and nothing to pay,
Every one with summit to say,
Going to Dudley by water.

Each philosopher so wise
Then set out with staring eyes,
The little fishes to surprise,
As go to Dudley by water.
Not a soul behind did lag,
But with hammer and with bag,
Smashed at dyke, slip, fault, and crag,
When they went to Dudley by water.

Skipping, dripping, all the way, etc.
Underground we then did go,
Candles round us in a row,
Such a flareup and a show,
All at Dudley by water!
Dr. Buckland then arose,
And the people there he shows
What rum beasts in stone there grows
In the caves at Dudley water!

Skipping, dripping all the way, etc.
Then at dinner sich a rush,
Sich a scramble, cram, and crush,
Lots of grub and little lush,
All at Dudley water!
And when we came back to town,
Warn't it funny that we found
All this fun for half-a-crown,
When we went to Dudley by water?

Skipping, dripping all the way, etc.

But if the going to Dudley by water was susceptible of humorous description, no description could do justice to the return of some twenty or thirty of the excursionists, including Henry Hallam among other eminences, who, in the scramble for departure, were stowed in the hold of a dirty and clumsy barge belonging to the works. Here, in order to beguile the tedious voyage, Forbes improvised and organised a Sectional Meeting, and if "roars of laughter" could show that the proceedings were of the most interesting and important nature (the usual language of the reports of meetings on shore), it would be proven that here was accomplished the greatest advance in science ever achieved by the Association. Alas! the record is lost, or was perhaps so smothered in mirth, as to have rendered it impossible ever to have been accurately reported?

The talent of our humourist, whose ridicule never inflicted a wound, while it served the cause of truth and gave rebuke to folly, took a cue in connection with the British Association from the example of one of its foremost ornaments, accomplished and agreeable and droll like himself,—need I name the much esteemed and much regretted Professor Buckland?

Passing on to more miscellaneous topics, I may remark that gastronomy and publications on cookery were favourite topics with Forbes. I have as many witty examples as would fill half a Leisure Hour. Here is one, supposed to be spoken by Professor Jerry O'Mullins, of Hedge University, Connemara, "On the Anatomy of the Oyster":—

ANATOMY OF THE OYSTER.

Of all the conchiferous shell-fish,
The oyster is surely the king;
Arrah, Mick, call the people who sell fish,
And tell them a dozen to bring;
For it's I that intend to demonstrate
The cratur's phenomena strange,
Its functions to set every one straight,
And exhibit their structure and range,
In sweet rhyme!

Now, boys, I beseech, be attentive,
On this Carlingford fasten your eyes,
As I spread it before you so pensive,
Its gape opened wide with surprise.
See that small purple spot in the centre,
That's its heart, which is all on the move;
For though looking as deep as a mentor,
It's tenderly beating with love
All the while.

Like a Chesterfield pea-coat, its liver,
Of fusty brown Petersham made,
It folds round its stomach to give a
Supply of fresh bile when there's need.
For though we when we swallow our oyster,
Like it raw, and by cooks undefiled,
The crature itself is much choicer,
Preferring its condiments *biled*—
It's so nice!

The fringes that circle its body,
Which epicures think should be clear'd,
Are the animal's lungs; for, 'tis odd, he,
Like a foreigner, breathes *through his beard*!
And among all its memorabilia,
Than this structure there's none half so queer,
Though Sharpey may say they are *cilia*,
A wiser contrivance to "spee,"
Let him try.

Now these are the facts in the history
Of an oyster I'd on you impress;
I've sarved them up plain without mystery—
To cook them would just make a mess.
So now, boys, we'll get in the whisky,
Since the water is hot on the hob,
Whilst we stir up our native so frisky,
By sticking the knife in his gob—
Dear ould fish!

Many letters were altogether poetical, with merely a line or two, such as "Dear J., if it please you." Here is one specimen in different strain:—

Through archipelagoes of hearts,
The bark of beauty sails,
Laden with love, for honour's marts,
Or isles where truth prevails:
Her swelling royals, snowy white,
In the bright sunshine gleam,
And from her topmast's lofty height
Untangled pennants stream.

Pilot, beware! be not too brave,
In that fair island sea;
Steer clear of every breaking wave,
Lest there a rock should be.
Look to your chart where dangers threat,
On each enchanting shore,
Whence passion's gust hath overset
A noble bark before.

The annexed are short and characteristic letters.

November 3rd, 1845.

DEAR JERDAN,—When busy with my Lycian work a day or two ago, the delicious taste of porcupine, on which we used to feed in the east, so haunted me, that I could not get rid of it until I had embalmed the dish in the accompanying unworthy rhymes, which, if not too rugged, may perhaps find a place in the Gazette with other of my (Asia) minor poems.

I have just come back from Paddies' land, which I left full of bad 'tators, both of the ordinary and the agi-tator-sort. There were a few, however, of the right kidney, perfectly sound.

Ever most sincerely,
EDWARD FORBES.

Accompanying this note was a poem, since reprinted, of which we may here give the two opening stanzas.

REMINISCENCES OF XANTHUS, BY A HISTRICOPHAGOUS TRAVELLER.

Dear Lycia! fair land of antiquities,
Which Fellowes first dared to explore.
My heart—oh! my heart, very sick it is
When I think I'm so far from thy shore!
From Xanthus, the home of my wishes,
Where we used to sup, breakfast, and dine,
On the dish of all dishes, delicious,
ON—COLD ROAST PORCUPINE!

Well I remember the cottage, where,
When the day's labour was o'er,
Hungry we hied for our pottage there,
And afterwards slept on the floor.
Though fleas in millions hopped over us,
No'er were we heard to repine—
Men making mighty discoveries
Fed upon COLD PORCUPINE!

Geological Society, Tuesday.

MY DEAR SIR,—If the enclosed squib is sufficiently dignified for the L. G., it may lighten the effect of my chemical prose of last week.

I saw you on Friday squatted among the gallipots at Faraday's extraordinary lecture. People have been enquiring here when some notice of it may come out. I tell them probably in the next L. G. I hope you mean to report it.

Here's a very mild epigram on the "matter"—

Great Faraday, a few days back,
The laws of matter did attack,
With wondrous hardihood.
In vain our notions he uproots—
When Faraday the subject moots,
The matter's always good!

Most truly yours,
E. FORBES.

With all this abundance of pleasantry, there were the solid foundations of moral rectitude, benevolent feeling, and great scientific acquirements, nor was the spirit of more touching poetic composition wanting. Gifted with such a diversity of talent as seemed almost universal, well did he merit the tribute being applied, "*Nihil tetigit quod non ornavit.*"

EDWARD JESSE.

At the great age of eighty-eight, Edward Jesse has lately been removed from the labours of a long life, passed with greater serenity and freedom from the ills that flesh is heir to, than is often the lot of man. To what do I ascribe this happiness? Not to a succession of official appointments, however agreeable and (latterly) congenial, so much as to his love of literary pursuits, and his taste for natural history. In his own line he never ceased from inquiry nor tired of investigation. All was done in a quiet earnest way. It might be into the identification of Herne's Oak, the gravity of the rumoured affection of George III for the fair Quakeress, or even the title of her Majesty to be the Lyrst of the lay, "Sweet Lass of Richmond Hill"! A dash of credulity adds a charm to the writings of naturalists; and I may relate an amusing instance of this imputed propensity, though sceptically nipt in the bud. In the river not a mile from Windsor, there lived a noble trout—estimated at seven or eight pounds weight, and having his local haunt close by the bank, and rendered almost inaccessible to the angler by the luxuriant foliage of an apple-tree overhanging the stream. Every attempt to allure him from his excellent feeding preserve had been tried in vain; no bait the most *recherché*, or introduced with the utmost cunning, could succeed. At last, however, the catastrophe came. A boy who had noticed his habits of a summer afternoon, got a stick, to which he appended a line and hook, and thrust it through the branches of the apple-tree on the bank, and dropped it baited with an apple-blossom into the water—and he caught the big trout! I believe this was a fact, and I told the story to Mr. Jesse, then engaged on one of his justly popular publications. It was printed and passing the press when my excellent friend was persuaded at Mr. Murray's, that I was practising a hoax upon him, and the veritable history of this fine specimen of what the Thames can nourish, and how a clever angler may catch them, familiar to all the inhabitants round about, was struck out of the book!

The letter I append is, I think, as characteristic of the genial feelings of its writer, as any such document can be, where there is no very marked peculiarity. It was written when he held the official post of "Deputy-Surveyor of the Royal Parks and Palaces." The son mentioned has recently distinguished himself in litera-

ture, and like Dillon the son of Croker, Tom junior the son of Hood, Peter the son of Allan Cunningham, Jerrold, Blanchard, Hazlitt, and others, who might be named, inherited so much of the paternal talent as to make themselves men of mark in a new generation.

DEAR JERDAN,—Thank you very much indeed for your kind present of seeds, and for your kind recollection of me. You are one of the few people in this world I should be sorry to be forgotten by, and I hope you do not think that I have forgotten you or the many agreeable hours I have passed in your company. Dickinson promised me to tell you this and much more, and I only wanted to be assured that you would be glad to see me, to have been with you long ago. I am in town every Tuesday and Friday, and upon either of those days I should be glad to call if you would like me to do so.

I hope you will see the terrace I have been making in Richmond Park. It is about a quarter of a mile in extent, leading from the Richmond Hill Gate to Lord Erroll's. In order to throw in different views, I have cut through the wood growing on the bank of the late Lord Huntingtower's property (which the Crown has purchased) at Petersham, and that property will henceforth form a part of Richmond Park.* The view from Richmond Hill (not forgetting that from the Star and Garter) is seen at once. Along the terrace I have just made a different view is seen every step you go, and at the end of the terrace the river presents itself at three different points, and the view is certainly much finer than that from Richmond Hill. You know the *locale*, and can fully appreciate fine scenery, and I shall therefore be glad to have your opinion of what has been done. I think that nothing in the kingdom can surpass it for effect and beauty.

Have you seen my son's pamphlet on the abuses of Eton School? If not, I should like to send it you. Thank you for the pleasant mention you made of the 2nd Series of Gleanings. With every kind wish, believe me,

Very truly yours,
Ed. Jesse.

Hampton Court, 22nd May, 1834.

THE CITY OF NORWICH.

SOME two centuries ago, quaint old Thomas Fuller thus wrote:—"Norwich is (as you please) either a city in an orchard, or an orchard in a city, so equally are houses and trees blended in it." "Yet," adds the shrewd and complimentary writer, "in this mixture, the inhabitants participate nothing of the rusticalness of the one, but altogether of the urbanity and civility of the other." The garden-like structure of the city is entirely in keeping with the marked taste of the inhabitants for the culture of flowers. "Approach the city on whichever side you may," says John Chambers, in his "General History of the County of Norfolk," "and you will see a neat little garden-plot before the door! You will see a few roses and dahlias, a jessamine, a clematis, or a vine climbing over the door. Nay, in the very heart of the city itself are to be found shows of ranunculuses and tulips, carnations and anemones; and in the most crowded parts of it you will see a little iron trellis-work before the window, guarding some humble pots of geranium and mignonette; or where this slight unexpensive protection cannot be afforded, you will often see a sweet-william, or a bunch of heart's-ease, or a marigold, peeping from within the poor weaver's garret window." This love of flowers is said to have been derived from the foreigners who found a home at Norwich in the reign of Edward the Third; and in yet greater numbers in the time of Elizabeth.

In such a city, and with a passion for flowers so strongly prevalent among the inhabitants, it was but natural to expect that attention would be given to the

study of systematic botany. Towards the end of the eighteenth century, Norwich produced a set of botanists mostly of the artisan class, who prosecuted the science with very considerable success. Contemporaneous with these local florists or their successors, arose a group of Norwich men of world-wide botanical renown, of whom it is enough to name Sir James Edward Smith, Sir William Jackson Hooker, and Professor Lindley. In another paper devoted to a notice of the celebrities of Norwich, we shall touch more at length on the career of these distinguished natives of the orchard-city.

Surveyed from a distance, the prominent objects which strike the eye of the observer are the castle, the cathedral, and the towers of numerous churches. The castle, a huge structure of Norman origin, but now modernised, holds a commanding position on an eminence near the centre of the city. Once the stronghold and residence of kings, it has since the reign of Henry III been converted into a county gaol. The interior, however, still preserves the genuine features of its original character.

The cathedral was founded by Herbert, the first Bishop of Norwich, in 1096; and the churches are mostly of very considerable antiquity. St. Peter's Mancroft, the largest, is a handsome edifice, with a noble tower ninety-eight feet high, and containing a peal of twelve bells, considered one of the finest of the kingdom. Many curious monuments abound in this church. Beneath the chancel repose the remains of the famous Sir Thomas Browne. North-east rises the noble fabric of St. Andrew's: it is built in the later pointed style, and was completed in 1506. Next in importance is St. Stephen's, which was finished after the Reformation. St. Michael's, Coslany, with its square tower, may be held to rank next. St. Giles's, occupying the highest ground in the city, also with a square and yet more lofty tower, is one of the finest of the Norwich churches. St. Giles's was entirely rebuilt in the reign of Richard II.

The origin of the city may be dated from the time of the departure of the Roman forces from the island, about the year 418. Castor, three miles south-west of Norwich, was a Roman station; some suppose the *Venta Icenorum* of the Romans. The natives, and those of the Romans who remained, from a preference to the situation of Norwich removed thither, and so founded the city, hence the couplet—

"Caster was a city when Norwich was none,
And Norwich was built with Caster stone."

Norwich* became the capital of the Saxon kingdom of East Anglia. The castle was erected on the site of an earlier fortification by Uffa, the first king of that people, in 575. Alfred the Great, it is recorded, strengthened the stronghold in 870. It was the object of frequent contests between the Saxons and the Danes. In 1004 the town was attacked by the Danish fleet, and laid in ashes. At that time it appears an arm of the sea stretched up as far as Norwich. By the middle of the tenth century, the town had for the period become both large and wealthy. The Danes settled in the county of Norfolk and town of Norwich in 1,010; and in 1021, Canute rebuilt the castle. In the time of Edward the Confessor, Norwich contained 1,320 burgesses with their families, and no less than twenty-five churches. It grew in importance until the time of the Conquest.

* The Park Terrace has been allowed to fall in some places into disorder, and well deserves restoration throughout.—[Ed. L. H., 1868.]

* North-wic in Saxon signifies a northern situation in a winding river, and because castles were usually placed at such situations the word *wic* was used for a castle. Norwich, therefore, may signify the northern castle at the winding of the river, the castle being situated near a loop of the Wensum, north of the ancient station at Castor.

William the Conqueror made Ralph de Walet governor, who having rebelled was subdued, but not without much injury to the town. Bishop Herbert de Losinga removed thither the seat of the See from Thetford in 1094, and began to build the cathedral and other ecclesiastical structures in 1096. From that time the city rapidly improved. William of Malmesbury speaks of it as famous for the number of its inhabitants and the extent of its trade.

Among the historical events which we may note in our rapid survey are the visits of royalty. Norwich was visited by Henry I, who kept Christmas there in

THE SNUFF TOWER.

1122, and conferred on the citizens a charter similar to that which had been granted to London. Almost all the English sovereigns to the time of Elizabeth were entertained in the city. Philippa of Hainault, the consort of Edward III, frequently visited Norwich, and was the patron of the colony of Flemish artisans, who, on the invitation of the king, had settled there in 1335. A great tournament was held in 1350, at which was present the Black Prince, with many of the nobility. It was on the 16th of August, 1578, that Queen Elizabeth arrived with her retinue. She was lodged in the Bishop's Palace, and stayed nearly a week. On her departure she declared that she had laid up such good will in her heart that she would never forget Norwich. On her journey, it is said, she looked back, with tears in her eyes, shook her riding-whip, and exclaimed "Farewell, Norwich!" Alas! Norwich had good cause not to forget the visit of the Queen. The roll of the town says that "the traines of Her Majesty's carriage, being many of them infected, left the plague behind them, which afterward so increased and continued, as it raged above a yer and three quarters after." Upwards of two thousand natives and a large number of the foreign refugees died during its continuance. This was not the first visitation of the plague; numbers had died in the year 1348, and again in 1479. The sweating sickness appeared in 1486; and towards the end of the 16th, and

beginning of the 17th centuries, there were repeated visitations of pestilence.

In 1422 the doctrines of the Reformation made their appearance in Norwich; and several persons were executed as Wickliffites or Lollards. Persecution continued until the accession of Edward VI, and was resumed with intensity during the reign of Mary. In 1531 the name of Thomas Bilney was added to the Norwich martyrology. Norwich was the scene of a local rebellion in 1549. The popular grievance was the enclosure of certain lands. Sixteen thousand men took up arms, led by two brothers of the name of Kett. They succeeded in obtaining possession of the city. In the conflict which ensued three thousand of the rebels were killed, and the leaders taken and executed.

We have alluded to the foreigners who settled in Norwich; with them originated the woollen manufactures for which it became famous. Elizabeth was throughout the ardent protectress of the Protestant exiles. The native artisans of the town having become jealous of the strangers, a conspiracy was formed in 1570 to expel them. A letter of expostulation, written by the Queen from her palace at Greenwich, to the citizens, rebukes them for their jealousy of the authors of their prosperity, and entreats them to continue their favour to the "poor men of the Dutch nation, who, seeing the persecution lately begun in their country for the true religion, hath fled into this realm for succour, and be now placed in the city of Norwich." The remonstrance of Elizabeth appears to have had a good result, for some time afterwards the magistrates of Norwich wrote to the Privy Council regarding the aliens in these terms: "They live wholly of themselves, do beg of no man, and do sustain their own poor people. They obey all magistrates and all good laws. They live peaceably among themselves and towards all men; and we think our city happy to enjoy them."

During the period of the Commonwealth the cathedral was greatly injured. Bishop Hall was driven forth; and on the 25th September, 1645, the mayor and aldermen were informed by a letter from William Lenthall, the Speaker of the House of Commons, that Parliament had resolved to settle a Presbyterian Government in the kingdom, and requiring them to consider how the city of Norwich may be most conveniently divided into distinct classical presbyteries, and to certify the same to the House with all expedition. Yet Norwich, in common with the other cities of the kingdom, accepted the restoration of the monarchy with thanksgiving and rejoicing.

In 1671 Lord Henry Howard, who in the year following was created Earl of Norwich and Duke of Norfolk, entertained Charles II and his Queen, with the Dukes of York, Monmouth, and Buckingham, at his palace in Norwich. "At eight o'clock in the evening," says the historian of the event, "both their Majesties, with the whole Court, which was very numerous, were treated with a magnificent supper in a very large room beautifully illuminated with flambeaux. The next day, having visited the cathedral and Bishop's Palace, and being everywhere attended with the loud acclamations of the people, their Majesties were treated by the city with a glorious banquet at the New Hall; and before the King parted from the city he conferred the honour of knighthood upon the famous physician, Dr. Thomas Browne."

The Ducal Palace, which was the scene of the royal festivities, and which was demolished in the succeeding century, Evelyn describes as an "old wretched building, part of it newly built with brick, and standing in the very

NORWICH.

market-place, and though near a river yet a very muddy one and without any extent." The castle, he says, is "an antique extent of ground, which they now call Marsfield, and would have been a fitting area to have placed the Ducal Palace in." "The suburbs," he adds, "are large, the prospects sweet, with other amenities, not omitting flower gardens, in which all the inhabitants excel."

Norwich, as it existed prior to the period of the Revolution, has been portrayed by the graphic pen of Lord Macaulay: "Norwich was," says that historian, "the capital of a large and fruitful province. It was the residence of a bishop and a chapter. It was the chief seat of the chief manufacture of the realm. Some men distinguished by learning and science had recently dwelt there; and no place in the kingdom, except the capital and the universities, had more attraction for the curious. The library, the museum, the aviary, and the botanical garden of Sir Thomas Browne, were thought by fellows of the Royal Society well worthy of a long pilgrimage. Norwich had also a Court in miniature. In the heart of the city stood an old palace of the Dukes of Norfolk, said to be the largest town house in the kingdom out of London. In this mansion, to which were annexed a tennis court, a bowling green, and a wilderness stretching along the banks of the Wensum, the noble family of Howard frequently resided, and kept state resembling that of petty sovereigns. Drink was served to guests in goblets of pure gold. The very tongs and shovels were of silver. Pictures by Italian masters adorned the walls. The cabinets were filled with a fine collection of gems purchased by that Earl of Arundel whose marbles are now among the ornaments of Oxford. Here in the year 1671 Charles and his Court were sumptuously entertained. . . . When the Duke of Norfolk came to Norwich he was greeted like a king returning to his capital. The bells of the cathedral and of St. Peter's Mancroft were rung; the guns of the castle were fired; and the mayor and aldermen waited on their illustrious fellow-citizen with complimentary addresses. In the year 1693 the population of Norwich was found by actual enumeration to be between twenty-eight and twenty-nine thousand souls."

As Norwich had decided for the Parliament during the civil war, so it declared for King William and the Revolution. The Duke of Norfolk, it is noted by Macaulay, attended by three hundred gentlemen armed and mounted, appeared in the stately market-place. The mayor and aldermen met him there, and engaged to stand by him against popery and arbitrary power. This spirit took the form of a popular outbreak in 1690, when the people rose, attacked the palace of the nonjuring Bishop Lloyd, which he was still suffered to occupy, and would have pulled it down but for the timely arrival of the trainbands.

Portraits of the mayors of Norwich adorn the walls of the Guildhall. Among them is a portrait of Horace Walpole, who represented the city in Parliament; and another of Lord Nelson, who was educated at the Grammar School. In the Guildhall is to be seen the sword taken by Nelson at the battle of Cape St. Vincent in 1797, and by him presented to the City of Norwich. It was accompanied by the following letter from Lord Nelson, in his own handwriting, addressed to the mayor, and which is also exhibited:—

"Sir,—Having the good fortune on the most glorious 14th February to become possessed of the sword of the Spanish Rear-Admiral Don Xavier Francisco Winthuysen, in the way set forth in the paper herewith transmitted, and being born in the county of Norfolk, I

beg leave to present the sword to the City of Norwich, in order to its being preserved as a memento of the event, and of my affection for my native county."

The river Wensum, on both banks of which Norwich is placed, and which, viewed at some distance, forms a picturesque object in the landscape, is, says Fuller, in his quaint way, "so wanton that it knoweth not its own mind which way to go; such the involved flexures thereof." The walls were begun in 1294, and finished in 1320, and looking at the outline of the city as enclosed, it fully bears out the notion of the old topographers, who compare it to a shoulder of venison. The walls, though still visible in some places, have been overrun by buildings which superadd a modern aspect and expression to the antique features of the garden-city. "As you stroll about Norwich," says a popular writer, "it has very much the air of an old city. A large number of the houses have many-gabled and overhanging fronts; and from the ground in which they are erected being very irregular and the streets narrow, they form picturesque antique-looking combinations; especially as some black church tower or the cathedral spire soars in the background above every prospect. But it is in these general views that the old houses show best: they have been mostly so altered—and in general no doubt necessarily—to meet the requirements of modern habits, that few retain much of their antiquity of details. Still the city looks old; and it is not difficult, in rambling about it, to realise to one's self a notion of its appearance, when a city of monks and soldiers, and soldier-like citizens: or later, when, rising into manufacturing eminence and wealth, its streets were thronged with a cheerful industrious population engaged in the ordinary duties of life, or crowding to witness some favourite pageant, a guild-day or a St. George's procession."

The market-place of Norwich, a picturesque feature, is so spacious that it ranks as one of the largest of the kingdom. St. Andrew's Hall, originally the nave of the Black Friars' Convent, is a splendid and capacious civic edifice.

There is much in the cathedral, the bishop's palace and deanery, with the Erpingham and Ethelred gates, to interest the antiquarian. The contents of the Museum will be found well worthy of examination; but without entering into further details, we may advert, in concluding our sketch, to the general aspect of the cathedral structure—the great distinctive feature of the City of Norwich; and this will best be done in the language of the writer already quoted:—"As seen from the lower slope of Mousehold Hill, the circular east-end of the cathedral, with its flying buttresses, forms a striking and majestic composition. Incongruities that somewhat mar the general effect, when looked at from a nearer point of view, do not catch the eye; but, indeed, it cannot be seen as a whole from any nearer position, owing to the lowness of the site and the various buildings which surround it. The eastern end, too, which is turned to the river, is by far the grandest. The western end, in spite of its noble window, has a meagre appearance. When examined closely, there is much to admire in the several portions of the exterior, although there is but little of that surpassing grandeur which is the characteristic of some other cathedrals. The tower is the most elevated of the Norman period remaining in England, and has an appearance of richness and solidity very pleasing. The spire is the loftiest in the kingdom, with the exception of that of Salisbury, to which it must also yield, although very fine in grace of proportions. The interior is far more imposing than the exterior.

As you enter the cathedral, the enormous Norman piers and columns in the nave, supporting the heavy circular arches and the two tiers of lighter arches above them, and the splendid stone roof spanning all, and in a long vista stretching before you, produce a feeling of awe that is not lost while you remain within the sacred walls."

PRE-HISTORICAL MAN.

II.

THERE are two opposing theories prevalent concerning the cause of man's progress in society. One is, that man being endowed with a capacity for invention, has progressed from barbarism to civilization by the exercise of this faculty alone. The rival theory, whilst it does not deny capacity or progressive improvement, affirms that there are facts in the case which neither of these circumstances will resolve or explain, and therefore maintains that some external communication has been at some time given or made to mankind, originating or aiding his development, and that barbarism is a degenerate, and not a normal, condition of humanity.

The former theory affirms that mankind were originally created in a savage and forlorn condition, left to trust to their own unaided faculties for getting on in the world.

The latter theory supposes that the first creation was accompanied by communications which helped man in religion and the arts of social life; that these were, by the bulk of mankind, subsequently lost, in part or in whole, but have been in various instances, in some form or other, preserved, and that traces of them are to be found amongst savage tribes.

We need hardly say that the latter supposition is in fact the statement of the Bible narrative. Although, with that record in our hands, we hold it to be fully proved thereby, yet we wish now to consider it quite apart from this proof; we desire, for our present purpose, to go into the domains of science and to form our opinion on its discoveries alone.

It is not an answer to the first theorist to say that there has been no uniformity in the development of civilization, the arts acquired by two distant tribes in the same duration of time are wholly different; because the conditions of the problem, the outward circumstances of climate and food, are also wholly different. Nor is it an answer to the second theorist to say, that, in spite of these differences, there is a marvellous similarity, at certain stages, in the development of people; because there are instances to the contrary, which destroy the value of the supposed evidence.

But there have been recently disinterred, or brought to notice, numberless relics of races of men who occupied western Europe before history commences. If these all indicate a natural growth and improvement, if they testify of such things only as barbarous man may discover and improve, then the first theory may be true, so far as any given locality is in question. It would therefore follow that the first theory is, to a certain extent, established as a true theory of progression.

On the other hand, if there are relics which indicate circumstances not explicable by this supposition, but demanding external communication, we infer immigration or trade; and if amongst these facts we still find phenomena insoluble by any supposition of mere natural origin, we shall be driven to the inference of a supernatural communication.

We appeal to the catalogue published in our last number, p. 518, in proof of the fact, that the intro-

duction of polished stone, of metals, and of the arts, amongst the primeval antiquities of western Europe, was not effected by educational processes of any kind, but by importation. Articles of new fashion and new material, new modes and new arts, are found all at once. So completely is this the case, that the only index-marks in this obscure chronology are those which have been found in the introduction of such foreign elements. The use made of these importations show subsequent improvement, and thus we find proofs of the scope and also of the limit of the first theory, whilst establishing the universal truth of the second.

Social science and geography attest the fact but too well known, that man is capable of individual and social degeneracy; not only capable, but liable to this downward process. The records of travel furnish very numerous cases of people who have wandered away from civilization, taken up with methods of savage life, become partially wild, and become also the progenitors of a semi-savage race which, in its successions, speedily retains nothing of civilization but some isolated habits and traditions. The South Sea voyagers and missionaries have registered many instances of the commencement and course of this decadence in the case of runaway sailors. Savage tribes and confederations have been formed by men originally wanderers from civilization.

The converse of this is also true, and has been still more frequently proved. Contrast a picture in "Cook's Voyages," representing a horrid human sacrifice there witnessed by the English navigators in the year 1777, with the present commercial, peaceful, and civilized aspect of the same place.

But how do we know that such civilization as this could not, and has not in some distant age of the world, been self-evolved? How do we know that it is not a genuine simple growth of man's nature? Simply by an appeal to facts. The world has been now well ransacked by intelligent observers, but it has only been to add proof upon proof to the tale of universal degeneracy. Mr. Ellis, author of "Polynesian Researches," speaking of the South Sea islands before a committee of the House of Commons, thus puts the case: "If civilization be viewed as consisting in exemption from temporal wants, and the possession of means of present enjoyment, the inhabitants of these islands were placed in circumstances more favourable to civilization than perhaps any other people under heaven. They have a salubrious climate, a fertile soil, and an abundance of all that could render the present life happy, so far as mere animal existence is concerned; but there was perhaps no portion of the human family in a state of wretchedness equal to that to which they were reduced before Christianity was introduced among them. They were accustomed to practise infanticide, probably more extensively than any other nation; they offered human sacrifices in greater numbers than I have read of there being offered by any other nation."*

And yet, these forlorn people possessed some relics of better days—some usages and traditions which cannot be explained by their condition at the time they were discovered by Europeans. The myths of Polynesia, attesting a common origin and a remote connection with distant civilized nations, are becoming the object of attention and the subjects of literature. To take an instance from tribes still lower in the scale, the Caffres, who were stated to have no notion of a deity: we are now told by missionaries who have studied in their midst,

* "Evidence on Aborigines," p. 178.

that they too have retained some traces of their loftier descent. Mr. Shaw, in his evidence before the Aborigines Committee, says:—"They are not idolaters, but they have the fragments of some very ancient system of religion still subsisting among them, in the form of singular observances, which they do not connect with any religious institution, though we know they must have been originally instituted for religious purposes; as, for instance, circumcision, burning incense, offering sacrifices and oblations; and the rain-makers, whom I regard as the successors of a former race of priests."*

The prevalence, at one and the same time, of barbarism in one part of the world and civilization in another, is just what would happen upon the communication of knowledge to beings capable of choice and self-improvement, or of degeneracy. This is so fully exhibited by the facts of geography that no hypothesis save this one of double action can adequately account for the phenomena. It is incredible that the enormous variations which have appeared during all our historical era could have resulted from a uniform law, although working under varying conditions.

The rude condition of man in Europe during the earliest period is quite consistent with contemporary civilization in Egypt and Assyria. [The former may well have resulted from early migration to ruder regions, and a process of gradual deterioration.

Sir John Lubbock affirms that it is inconceivable that certain arts of civilization could ever have been so totally lost as is evinced in the case of certain rude tribes. Against this we may say that it is still more incredible that tribes so rude should have invented some of the arts or usages which we find among them.

Thus we are brought to the conclusion, that whether barbarism is a natural result, or civilization a natural growth, the one may certainly have been derived from the other, and the Scripture account may be true for aught that science can show. But when we regard other considerations, language and tradition, we get a step further, and find the Scripture account supported by the highest probability of which the case admits.

Max Muller says:—"As far as we can trace back the footsteps of man, even on the lowest strata of history, we see that the divine gift of a sound and sober intellect belonged to him from the very first; and the idea of a humanity emerging slowly from the depths of an animal brutality can never be maintained again."†

Archæology, too, furnishes its quota of evidence towards the same conclusion. The proposition that the arts found among barbarians have been communicated and not originated is supported by the existence among them of such contrivances as the fire-drill, the use of cooking stones, the art of smelting and working metals, and other accomplishments which, either from their nature or the mode of their performance, make it obvious that they were not the product of the mere invention of the people using them.‡ So the prevalence of particular customs that must have had an artificial origin tells the same story, such as the *needfire*. So the universality of certain traditions, *e.g.*, of a deluge, and the re-peopling of the earth by one pair. So the remarkable correspondence between popular tales or traditions of different and distant people.§ So the almost universal origin of traditions or tales apparently grounded on the

early Bible narratives.* Humboldt long since concluded that the civilization of Mexico had a common origin with that of Asia, and that both people were united either by common descent, by commerce, or by migration.†

The word *civilization*, in its popular sense, expresses a twofold idea, the progression of society and of the individuals composing it; or, in other words, the establishment of beneficial, social, and political arrangements for the community, and the promotion of personal, moral, and intellectual progress. The double process is included in the ordinary meaning of the word.

Man possesses in an elemental condition, the faculty, the germ-power of this development. He also manifests a tendency to social and individual deterioration.

Uncivilized tribes, visited at infrequent intervals, left without useful foreign communications, have been observed to be stationary, or to deteriorate.

From all these facts we conclude that there was an epoch of primary civilization; not of refined and perfected knowledge, but of acquaintance with internal power and the surrounding portion of external nature, with an appreciation of the objects of life and of the means of promoting them, and of religious duty and pleasure. The endowments which man received from God must have been accompanied by some instruction as to their use. Such instructions comprised language and the common arts of life.

The language of Archbishop Whately still expresses most clearly the warrantable deductions from the facts, so much more extensively collected now than even at the date of his "Essay on Civilization."

"It has been very commonly taken for granted, not only by writers among the ancient heathen, but by modern authors, that the savage state was the original one, and that mankind, or some portion of mankind, gradually raised themselves from it by the unaided exercise of their own faculties. I say 'taken for granted,' because one does not usually meet with any attempt to establish this by proof, or even any distinct statement of it; but it is assumed, as something about which there can be no manner of doubt. You may hear plausible descriptions given of a supposed race of savages subsisting on wild fruits, herbs, and roots, and on the precarious supplies of hunting and fishing; and then, of the supposed process by which they emerged from this state, and gradually invented the various arts of life, till they became a decidedly civilized people. One man, it has been supposed, wishing to save himself the trouble of roaming through the woods in search of wild fruits and roots, would bethink himself of collecting the seeds of these, and cultivating them in a plot of ground cleared and broken up for the purpose. And, finding that he could thus raise more than enough for himself, he might agree with some of his neighbours to exchange a part of his produce for some of the game or fish taken by them. Another man again, it has been supposed, would contrive to save himself the labour and uncertainty of hunting, by catching some kinds of wild animals alive, and keeping them in an enclosure to breed, that he might have a supply always at hand. And again others, it is supposed, might devote themselves to the occupation of dressing skins for clothing, or of building huts or canoes, or of making bows and arrows, or various kinds of tools; each exchanging his productions with his neighbours for food. And each, by devoting his attention to some one kind of manufacture, would

acquire increased skill in that, and would strike out new inventions.

"And thus these supposed savages, having in this way become divided into *husbandmen, shepherds, and artisans* of several kinds, would begin to enjoy the various advantages of a 'division of labour,' and would advance, step by step, in all the arts of civilized life.

"Such descriptions as the above, of what it is supposed has actually taken place, or of what possibly might take place, are likely to appear plausible, at the first glance, to those who do not inquire carefully and reflect attentively. But, on examination, all these suppositions will be found to be completely at variance with all history, and inconsistent with the character of such beings as real savages actually are. Such a process of inventions and improvements as that just described is what we may safely say never did, and never possibly can, take place in any tribe of savages left wholly to themselves. . . .

"But as for savages properly so styled—that is, people sunk as low, or anything near as low, as many tribes that our voyagers have made us acquainted with—there is no one instance recorded of any of them rising into a civilized condition, or, indeed, rising at all, without instruction and assistance from people already civilized. . . .

"Then, again, if we look to ancient historical records and traditions concerning nations that are reported to have risen from a savage to a civilized state, we find that in every instance they appear to have had the advantage of the instruction and example of civilized men living among them. They always have some tradition of some foreigner, or some being from heaven, as having first taught them the arts of life. . . .

"We have, therefore, in this case all the proof that a negative admits of. In all the few instances in which there is any record or tradition of a savage people becoming civilized, we have a corresponding record or tradition of their having been aided by instructors; and in all the (very numerous) cases we know of in which savages have been left to themselves, they appear never to have advanced one step. The experiment, as it may be called, has been going on in various regions for many ages; and it appears to have never once succeeded. . .

"Since it appears, then, a complete moral certainty that men left unassisted in what is called a state of nature,—that is, with the faculties man is born with not at all unfolded or exercised by education,—never did, and never can, raise themselves from that condition: the question next arising is, When and how did civilization first originate? How comes it that the whole world is not peopled exclusively with savages?

"Such would evidently have been the case if the human race had always from the first been left without any instruction from some superior being, and yet had been able to *subsist at all*. But there is strong reason to doubt whether even this bare subsistence would have been possible. It is most likely that the first generation would all have perished for want of that scanty knowledge, and those few rude arts which even savages possess, and which probably did not originate with them, but are remnants which they have retained from a more civilized state. If it be supposed—and this is one of the many bold conjectures that have been thrown out—that man was formerly endowed with many instincts such as those of the brute creation, which instincts were afterwards obliterated and lost through civilization, then the human race might have

subsisted in the savage state; but we should all have been savages to this day. How comes it, then, that all mankind are *not* at this day as wild as the Papuans and Hottentot-Bushmen? According to the present course of things, the first introducer of civilization among savages is, and must be, *man* in a more improved state; in the *beginning*, therefore, of the human race, this, since there was no *man* to effect it, must have been the work of *another being*. There must have been, in short, something of a REVELATION made to the first or to some subsequent generation of our species. And this miracle (for such it clearly is, being out of the present course of nature) is attested *independently* of Scripture, and consequently in *confirmation* of the Scripture accounts, by the fact that civilized man exists at the present day. Each one of us Europeans, whether Christian, Deist, or Atheist, is actually a portion of a standing *monument* of a former communication to mankind from some superhuman being. That man could not have *made* himself, is often appealed to as a proof of the agency of a divine *Creator*; and that mankind could not, in the first instance, have *civilized* themselves, is a proof of the same kind, and of precisely equal strength, of the agency of a divine *Instructor*.

"It will have occurred to you, no doubt, that the conclusions we have arrived at agree precisely with what is recorded in the oldest book extant. The Book of Genesis represents mankind as originally existing in a condition which, though far from being highly civilized, was very far removed from that of savages. It describes man as not having been, like the brutes, left to provide for himself by his innate bodily and mental faculties, but as having received at first some immediate divine communications and instructions. And so early, according to this record, was the *division of labour*, that, of the first two men who were born of woman, one is described as a tiller of ground, and the other as a keeper of cattle. But I have been careful, as you must have observed, to avoid appealing, in the outset, to the Bible as an authority, because I have thought it important to show, independently of that authority, and from a monument actually before our eyes,—the existence of civilized man,—that there is no escaping such conclusions as agree with the Bible narrative."

Archbishop Whately's arguments, although attacked by various opponents, most recently by Sir John Lubbock, still remain firm and unshaken. We may grant to Sir John all his facts, and apply to them successfully the archbishop's hypothesis; while there are admitted facts in the case which Sir John's hypothesis will not explain. The mere multiplication of *such* facts adds nothing to the evidence in the point at issue. "The important question," says Humboldt, "has not yet been resolved, whether that savage state, which even in America is found in various gradations, is to be looked upon as the dawning of a society about to rise, or whether it is not the rather fading remains of one sinking amidst storms, overthrown by overwhelming catastrophes. To me the latter seems to be nearer the truth than the former." Niebuhr also expressed his conviction that all savages are the degenerated remnants of more civilized races, who had been overpowered by enemies, and driven to seek safety in woods and waste places till they had forgotten most of the arts of settled life, and gradually sunk into the state in which they are now found. The learned researches of Professor Rawlinson all lead to the same conclusion. We have already admitted that, within certain limits, savages

are capable of some improvement, as might be expected where reason is added to instinct. But we hold that the theory of man having raised himself, by spontaneous and progressive development, from a primitive savage state, and from yet lower forms of organic life, is not supported by proof. The theory of Divine interposition is the true scientific explanation, inasmuch as it alone meets *all* the facts of the case.

MY FIRST CURACY.

CHAPTER II.—MY FIRST CURACY.

WHAT a fund of lively conversation has a first curacy formed in the circle of clerical friends; how very vivid, even after a lapse of years, are the incidents of a first curacy! It seems to me that the trials, successes, failures, and cares of a first curacy, are as much and as deeply stamped upon the mind of a young clergyman, as are the lessons of early childhood themselves. How ardent are the desires, how fervent the wishes, of a young minister, who, fresh from taking the Ordination vow, enters upon his solemn engagement to work for God in his first curacy!

And who among us of the clergy, as he looks back upon that memorable day when he ascended the pulpits to deliver his first sermon, does not heave a sigh, as he thinks of the crust of worldliness which has encircled all those holy aspirations with which he was then filled, how the promises of self-devotion and single-heartedness towards God have become too much a thing of the past and of memory only? I do not say that there is no devotion remaining, no desire to do one's duty as a clergyman; but there is no longer that freshness, that heartiness, that oneness of purpose which there was when we first entered into "the Holy Order of Deacons." Happy, yea, thrice blessed, are they who, by God's grace, have been enabled to retain all the zeal and devotedness of their first love!

I will pass over the preliminary preparation, the signing of the necessary papers, the ordeal of the Bishop's examination, which, in my case, was rather below the average in scholarship questions, but with perhaps more practical parochial ones than generally falls to the lot of candidates to be examined upon. And I cannot help thinking that if a man has passed the University tests in matters of scholarship, that the Bishop's examination questions should mainly be directed to that special sphere of work in which we were about to engage—and concerning which many of us knew very little.

The final day of examination was of course an anxious one, especially when, during the morning, we saw one candidate for deacons' orders, and two for priests', called out singly and never return to finish their paper they were engaged upon. When summoned from the room, we began to look one another in the face, and our hearts beat fast, as, after a considerable pause, the verger opened the door to call out another martyr, as we supposed. However, this gentleman soon returned with a beaming countenance, and upon a second re-entering the room in like manner, we, the remaining ones, began to breathe more freely, and congratulate each other with the hope that all the rest of us had passed; and so it proved, happily, to be the case.

I shall not describe the ordination scene; it has been so often witnessed, and so frequently written upon, for who, as a simple spectator, has ever seen that solemn rite performed unmoved! But how much more solemn, how

much deeper an impression must it make upon the candidate who is about to take upon himself vows, and to receive an office which can only be shaken off by death—and after death, what a stewardship to have to render account of!

On the following morning, having received our licences and letters of orders, we were scattered to our different spheres of labour. Up to the present time I have only twice met with any of those with whom I was ordained, either deacon or priest.

My introduction to my first incumbent took place as I descended from the top of a coach on which I had been riding for the last five hours, through some of the beautiful scenery of Devonshire, among whose "Tors" my curacy lay. It was a very retired and secluded spot, far removed from any town, and with very little society, the one great event of the day being the stoppage of the coach at a little roadside inn on the extreme verge of the parish.

This want of society, however, was, as I found by experience, amply compensated by the very agreeable and cheerful disposition and manners of my vicar and his amiable wife. He possessed a great fund of anecdote and useful information, and had a great talent for describing scenery and actions which he had witnessed in his travels abroad; indeed, himself and wife had spent the greater part of seventeen years in various parts of Europe, and their conversation was most interesting and instructive. Most likely it was from the fact of his having travelled so much, that he was, if I may so speak, wider-minded than the majority of country clergy generally are found to be. He had lately been inducted into the living, and was anxious to obtain the services of a curate with whom he could be on the most intimate terms. I think we mutually agreed in this respect, for during the time that I resided with him, we never had the least disagreement. We worked most harmoniously together, and I shall always look back with the greatest pleasure to the happy years I spent in that secluded rustic-thatched Devonshire parsonage.

I believe that in sentiment and in taste, we could not have been more in unison; and further than this, with regard to my own personal comfort, my vicar and his wife both treated me as a younger brother, and not as if I belonged to a different race or of a distinct order, as alas! some curates of my acquaintance have been treated by rectors and their wives.

We both were fully employed, and had plenty of work cut out for us in the geographical position of the parish, consisting as it did in an area of eight miles in diameter, and with a population of two thousand collected into five or six separate little hamlets. One of these hamlets was much larger than the rest, and was allotted to me as my special charge. It was situated at some distance from the parish church, which by some strange freak of its founder, had been built away from the majority of the inhabitants, in order, so it was said, to try the faith of the people. I certainly wish that he had tried their faith in another way, for the natural consequence was that on wet days (and we have our full share among the Tors of Devon, where, if it is no pouring rain, it is nearly always drizzling) our faith was severely tried by seeing frequently a more than half empty church.

The occupation of the inhabitants was purely and simply agricultural. They were excessively ignorant, and consequently very superstitious; indeed, I have always found that the two go naturally together; and I may add that the inhabitants of highland districts

are invariably more so than those dwelling in the low lands. In fact, the parish had been much neglected during the last few years, as the late incumbent, a very old man, had entirely given up pastoral visitation, through his infirmities, and he was also in such needy circumstances himself, that he could not afford to procure the services of a curate.

The living was a very small one, the great tithes being swallowed up by a non-resident landlord, as is too often the case with country livings in the West of England. The roads through the parish were of course, from their locality, very hilly and uneven; they were also narrow, with high banks on either side, but the "waywardens" had kept them in much better repair than were those of the majority of Devonshire parishes. The narrowness of these roads or Devonshire lanes may be understood from a curious and useful custom existing among the farmers and their carters. Sometimes for nearly a quarter of a mile two vehicles could not pass. Waggon laden with corn, or going to market, always wore loud-sounding bells, in order that another waggon coming in a contrary direction might pull into one of the recesses made in the side of the bank in order to allow of the other passing. There were, however, frequent altercations between the drivers of the different waggons as to whose duty it was to wait for the other, and when returning from market not quite sober, these disputes often ended in blows and fights, and frequently produced ill-feeling among their respective employers.

CHAPTER III.—THE PARISHIONERS.

STRANGE as it may appear, and nearly an incredible fact to many, yet it is perfectly true that there was not a family bearing the name of Smith, Brown, or Jones, and only one Robinson, in all the two thousand people which composed the population of my first curacy.

The squire was non-resident, a most fortunate circumstance for both parson and people. The residence of a good squire is as great a blessing in a rural parish as that of a bad squire is a curse. About once a year he came to visit some of his tenants, a time of disgraceful lawlessness and of dissipation. I cannot refer to his doings without severe censure, yet of himself I must speak in sorrow rather than anger. There were good points in his character, though overborne by evil influences and evil companionship. I will dismiss him with the mention of some things to be recorded to his praise, or to the encouragement of those who, in dependence on the great Overruler of men's wills, try to influence unlikely agents to do unlikely things. He gave a new and expensive organ to the church, and handsomely restored the chancel, and beautified it by the introduction of some good stained glass, adding also a very good altar-cloth and some richly-carved communion rails. One special act of generosity I ought not to forget, especially as it was performed towards a poor curate. In the neighbouring parish lived a married curate and his wife and family, so poor that they could not afford to keep a servant of any description, and frequently were a whole week together without tasting animal food. One Christmas morning this married curate received from our squire the handsome and unexpected present of a cheque for one hundred pounds, and a nomination for his eldest son's entrance into Christ's Hospital.

The farmers of the parish were a well-to-do set of men, and, taken as a whole, were rather superior and intellectual, and the majority of them well affected towards the church. But singularly enough, while they

professed a love for literature, and those from the greatest distance came regularly at least once a day to service, they were totally indifferent as to whether their servants or their children came, and they were most vehemently opposed to any system of education. Of course there were discontented, self-opinionated men who made themselves disagreeable, but they formed, happily, but a small minority of the parishioners.

I have much more to say about our poor, the mass of our parishioners. As a whole they were extremely poor, but generally speaking contented: railways had not penetrated that part of Devonshire, and from the want of communication with the outer world, they knew nothing of the larger wages to be obtained in more thickly populated localities. And upon how little they had to be contented; a man's full wages for agricultural labour being seven shillings a week, with the exception of hay and harvest time, when they were a little higher! It is true sometimes milk was found for the family, and cider for the labourer, but this was not universally the case.

Rents were, however, cheap, one shilling and one shilling-and-sixpence a week being the usual rate, and I have positively known them as low as sixpence a week, but this was for a mere hovel. These cheap houses were not built of brick or of stone, but of "cob," a mixture of mud, stones, straw, and small-coal, and were generally thatched and white-washed. The floors were often of rough round stones, and where tiles or quarry had been laid down instead of these rough uneven stones, it was no uncommon custom for the indwellers to attempt to stain one half of the square tile to a greenish colour, with potato tops or other vegetables.

My readers may know that peat is the article commonly burnt as fuel in many parts of Devon, as coal is excessively dear on account of the expense of cartage; indeed, in the part in which I resided, we paid thirty-seven shillings a ton for it, so that it was quite beyond the reach of the poor; but in consequence of the constant burning peat in their fireplaces (grates they had none), it is a fact that the whole of their clothes, food, houses, and the people themselves, and even the air, was tainted and strongly impregnated with the smell of burning peat. This odour produces a very disagreeable effect upon strangers; and reading aloud in a cottage which is heated with a peat-fire causes great irritation to the throat, and produces a smarting pain in the eyes. The cutting of the turf, in order to make it ready for fuel, is attended by little labour or fatigue, as it lies compact and in great quantities on the moors. It is mostly prepared by the women alone, needing little help from the men.

Of drainage there was little or none in any of the hamlets; and the whole of the population were dependent upon watercourses and springs for their supply of this great necessary of life and cleanliness. The only pump in the parish was at the Vicarage, so that during the summer season not only were there great inroads made upon our supply, but there was generally a great scarcity of water throughout the parish, and much inconvenience experienced by the necessity of fetching it from a distance. Indeed, if a fire had broken out, what with the thatched roofs and want of water, the consequences must have been most fearful, and such is actually often the case in villages similarly situated.

During the declining years of the late vicar a school of rather a superior class had attempted to establish itself in the larger hamlet which fell into my share of the parish to look after. All I could ever see about the school was that an old man used to walk about and

thrash the boys, but I never found out that they really learnt anything. Over this school we had no substantial control for some few years, though I was permitted on sufferance to visit occasionally. When I went unexpectedly I found the old man in his shirt-sleeves blacking his boots, or in some equally unscholastic employment, the boys sticking pins into each other, or up to other mischief. Of course there was no order or method of teaching, except when the master, stung into rage by some more than usually flagrant misconduct, rushed up and down the school, hitting right and left innocent and guilty alike. I once caught him in the midst of such a scene; I hope I may never witness such another.

Eventually we got matters on rather a better footing, for the master falling ill, we got the permission of the persons to whom the school virtually belonged, to procure the assistance of a man from the training-school of the diocese, and he managed, in the few months in which he stayed, to impart a little knowledge, and to produce a little order and discipline.

We found that it was utterly impossible to set up a rival school to this wretched burlesque of one; the vicar's income did not allow of his paying an efficient master, and as I have already stated, the farmers, from their being opposed to all education, were only too pleased to let matters continue as they were.

I ought to say that there were three or four little dame schools in the parish, at one of which I saw the old horn primer still in use. At this little school, for the purpose of astonishing the new vicar upon his first visit, the very small children were called up by the woman in charge, to repeat the first chapter of St. Matthew's Gospel, which the little things lisped out as well as they could. What mistakes they made in pronouncing the names I shall never know, for I was completely convulsed with laughter at the supposed correction of the names by the old dame herself.

I found out subsequently that this exhibition was frequently repeated, particularly when any stranger called. I tried to take this school in hand, but failed to make much progress, for in spite of my expostulations, this dame schoolmistress would continue to teach the children solely to read the Revelation of St. John for New Testament reading; and Leviticus was the only book they were ever allowed to read in the Old Testament. Time after time, I altered the chapters, plainly pointing out to her what was most proper for them to read; but all to no purpose, for no sooner was my back turned, than Leviticus and Revelation were resumed; and if I dropped in accidentally at a later period of the day, I should be sure to see the children hard at work spelling out the ceremonial law, or else bewildered among the prophetic mysteries of the seals and vials.

Soon after my arrival among the people of my first curacy, I was much struck with the various and strange greetings with which I was welcomed. When I entered the house of one of the poorer parishioners, I was invariably politely asked, "Will you perch?" meaning would I be seated. In the farm-houses the customary form of offering hospitality was, "Will you take something to make use of?" A poor man or woman would not let you set back your chair against the wall when you rose to leave, having finished your visit, it being a sure sign that you never intended to visit him again; and for the same reason I found that in the houses of the richer parishioners you were never allowed to fold up your dinner-napkin. I thought when I often heard the expression, "Rampant with pain," that it was expressive; as also, "I did not think he would turn over so soon," meaning die so suddenly.

Varieties.

GOLD PRODUCT IN VICTORIA.—The yield of gold from the mines of Victoria for the year 1867 was 1,493,831 ounces. The average number of miners employed was 65,857, and the average earnings 35s. per week. The gold-mining companies in the colony paid in the year 1867 dividends amounting to more than £820,000, being a much larger number of pounds sterling than the number of the entire population—men, women, and children. The amount would be very largely increased if there were added the profits of private mining undertakings, and of companies who do not make public their yields and dividends.

VALUE OF HIGHLAND PROPERTIES.—Sir Thomas M. Riddell, Bart., has supplied the *Inverness Courier* with the following memorandum, which is extremely interesting as showing the great advance in the value of land in some of the most inaccessible parts of the West Highlands within a hundred years. Guisachan, the property in question, is situated on the southern or Sunart side of the head of Lochshiel:—"Guisachan: Rent in 1767, £10 10s. Sheep rent in 1867, £175; game rent in 1867, £30; rent in 1867, £205. Sold lately by Sir Thomas Riddell to Mr. Howard, of Stanley, near Perth, for £8,120, being twenty years' purchase of the game rent, and fifty years' purchase of the sheep rent."

PRESIDENTIAL LITERATURE.—Seldom is a precocious offender brought into the dock but evidence is given that, on searching him or his dwelling-place, a heap of foul fictions is found. The kind of work in question is not likely to come under the eye—or nose—of many who read this journal; nor is it necessary to annoy their senses by more than a general reference to the character of the poison. But it is well that the educated classes, and those who exert themselves to educate others, and find with dismay that their efforts are baffled by some undercurrent, should know that to the boys of the humbler class there are sold, in enormous quantities, penny stories of the most atrocious kind. These hell-broths are spiced to please the taste of the demoralised lads. The hero is a boy "of spirit," who scorns honest trade and the making "a few dull shillings" a week, and who takes to robbery, either by fraud or force. He is bold and prosperous. He has his reward in all, the pleasures he can understand, his "jovial glass," and in the means of other profligacy. The combined attraction of an exciting story and of foul morals is irresistible. The reformatories are full to overflowing, and our cities swarm with young reprobates. Now, we make—and properly—a great fuss about the sale of physical poisons, and the druggist is compelled to label his bottles with the word of warning. But, for one dose of physical, a thousand doses of moral poison are sold. We cannot even trust our theatrical audiences, though they are juries from each class, to decide what is good for them, and we have a censorship. But, unless a book is so brutally coarse as to come under Lord Campbell's Act, there is no check upon the vendor of garbage.—*Illustrated London News*.

BISHOP SELWYN ON BAZAARS.—Some time ago, Bishop Selwyn attended at the village of Curbar to consecrate a new church. In responding to his health, at a luncheon which subsequently took place, his lordship, referring to the work that had called them together that day, expressed a hope that they would not cease in their endeavours in connection with this church until school-rooms and a parsonage had been also erected. Let them on no account have a bazaar. He thought that was a very unmanly way of raising money. The meanest thing men could do was to throw work on the women. He said that advisedly, because having lived twenty-five years among savages, he recognised that their distinguishing mark was to make women do the work of men. That was the system on which bazaars were held. He hoped they would complete their endeavours by direct taxation, not indirect. When he returned from New Zealand, he hoped he should find the remainder of the money necessary for the schools and parsonage had been raised. But his last words were, "Don't have a bazaar." [Ladies are better judges than the Bishop as to the duties, drudgeries, or delights of thus taking their share in good work.]

THE ABYSSINIAN CAMPAIGN.—The despatch of Lord Stanley declaring war against Abyssinia was sent on the 16th of April, 1867, and on the 13th of April, 1868, Magdala was taken and the Emperor Theodore was no more. Sir R. Napier landed at Zoulla on the 3rd January, 1868, and in exactly 100 days the campaign was over.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cooper*.

SAD EFFECTS OF INTEMPERANCE.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER IX.

WHEN we got sufficiently near the beach to distinguish objects, we saw the captain standing with a pistol in his hand, which was pointed at the mate, who held a long knife in his hand, with which he was about, it seemed, to make a rush at his opponent, while three or four men had arranged themselves on either side, and were flourishing various weapons. The shots we heard told us that they had already fired at each other several times, but were too tipsy to take a steady aim. One

man, however, lay wounded on the ground, and from the gestures of the mate, he would in another instant plunge his knife in the bosom of the captain, unless stopped by the latter's bullet.

"You knock up the skipper's arm, while I seize the other fellow," exclaimed O'Carroll to me, springing forward.

I did as he bid me; he ran a great risk of being shot. The mate turned on O'Carroll with an oath, and the captain snapped his pistol at me, but fortunately he had already discharged it, and in another instant I brought him, as he attempted to grapple with me, to the ground.

O'Carroll had mastered the mate, and the other men stood staring at us, but offering no opposition. "Is this the way for men to behave who have just been saved from death, to make yourselves worse than the brute beasts? This—this is the cause of it!" exclaimed O'Carroll, kicking a cask from which a stream of spirit was even then running out. "It would have been no loss to us if you had killed each other, but we could not see our fellow-creatures perish without trying to save them."

The bold and determined tone in which O'Carroll spoke, aided by the arrival of the rest of our friends, had such an effect on the seamen, that those who were still able to move slunk away to a distance, while the captain and his mate, when we let them go, sat down helplessly on the sand, forgetting entirely their quarrel and its cause. There they sat, laughing stupidly at each other, as if the affair had been a good joke. While O'Carroll was emptying the rum cask, which it appeared had been washed on shore and secreted by the captain, his men went to the wounded man. He did not speak: he seemed scarcely to breathe. I took his hand: it was already cold. All this time he had been bleeding to death: an artery had been shot through. We did our best in the dark to bind up the wound and stop the bleeding; the spirit which might have kept his heart beating till nature, in her laboratory, had formed more blood, was gone; indeed, probably in his then condition it would not have had its due effect. The wretched man's breath came fainter and fainter. There was no restorative that we could think of to be procured. We lifted him up to carry him to the camp, but before we had gone many paces, we found that we were bearing a corpse.

"That man has been murdered," exclaimed O'Carroll, turning to the captain. "By whose hand the shot was fired which killed him I know not, but I do know that his blood is on the head of the man who ought to have set a good example to his inferiors, and prevented them from broaching the cask they had found."

Whether this address had any good effect we could not tell, but hoping that the men would remain quiet and sleep off the effect of their debauch, we returned to our tent, leaving the body on the ground. The next morning we returned to the beach. The captain and his drunken companions still lay on the sand asleep. They were out of the reach of the sea, but the hot rays of the rapidly rising sun, which were striking down on their unprotected heads, would, I saw, soon give them brain fever or kill them outright, if they were to be left long exposed to their influence. I therefore proposed that we should rouse them up, and advise them to go and lie down in the shade of some shrubs and rocks at a little distance.

"Before we do so, we'll take away their weapons, and at all events make it more difficult for them to do mischief to us or to themselves," said O'Carroll. Some of the men grumbled on being disturbed, as we turned them round to take away their knives. We left the unloaded pistols, which, as they had no powder, could do little harm. Having taken their arms to our tents, we returned and awoke them, not without difficulty, by shaking them and shouting in their ears. One after the other they got up, lazily rubbing their eyes and stretching themselves, and staring stupidly about them. The captain was one of the last to come to his senses. He started when he saw the dead body of his companion.

"Who killed that man?" he exclaimed, in an anxious tone.

"You did, most probably," answered O'Carroll. "We heard shots fired and found the man dead."

The captain felt in his pocket, and drew out a pistol with the hammer down: it had been discharged. "Then I am a murderer!" he exclaimed, in a tone of horror, his countenance expressing his feelings. "It wanted but that to make up the measure of my crimes."

"It is but too true, I fear," said O'Carroll.

"Yes, too true, too true," cried the captain, rushing off towards the sea, into which he would have thrown himself, had not O'Carroll, William, and I, held him back. It was some time before we could calm him sufficiently to leave him alone. He then went and sat down in the shade at a little distance from his companions, who looked on at him with dull apathy, while he gave way to the feelings which the prickings of his awakened conscience had produced. How he and the mate had got possessed of the pistols we could not guess, till we found the chest of one of the emigrants, a young man, broken open, and from this they had helped themselves. One of them soon after came for a spade which had been landed, and we saw them hurriedly bury the corpse, as if eager to get the silent witness of their crime out of sight. For the remainder of the day they were perfectly quiet, the mate coming humbly when the provisions were served out to ask for their share; still we could not trust them, as we knew that if they could get at more liquor, they would very quickly again be drunk. In the evening, indeed, they were seen walking along the beach, evidently watching for the chance of another cask being washed on shore. They did not find one, however, and the next morning were excessively sulky, keeping together and pretty evidently plotting mischief. They, with the rest of us, were aroused, however, soon after breakfast by the appearance of a sail in the offing. The more sanguine at once declared that she was standing towards us, and that our fears regarding a prolonged stay on the island were groundless; others thought that she would pass by and leave us to our fate. Every spy-glass was in requisition, and numerous were the surmises as to the character and nationality of the stranger.

"What if she is an enemy?" observed William:

"She will not find much plunder, at all events," answered Trundle. "There is nothing like being at the bottom of the hill, so that you cannot be kicked lower."

"Even an enemy would respect our condition," remarked O'Carroll; "we have nothing to fear from one, I should hope."

"No, but an enemy would leave us where we are: a friend would carry us away, or send us assistance," said I.

It was dinner-time, and Jacotot had prepared our messes with his usual skill; but so eager were the people watching the approaching stranger, that the food was scarcely touched, except by the children, who of course little knew how much depended on her character. At length there was no doubt that she was standing for the island, and the exhibitions of joy and satisfaction became general among the unfortunate emigrants. They would now be able to leave the island and reach their land of promise; every countenance beamed brightly, except O'Carroll's. After some time I saw his fall. It gained a more and more anxious look. He scarcely withdrew the glass from his eye.

"What do you make her out to be, O'Carroll?" I asked.

"Braithwaite, as I am a living man, she's the Mignonne," he answered, in a hoarse voice, his counten-

ance still further showing the agitation of his mind; "if that villain La Roche gets hold of me again, he'll not let me escape with my life. And these poor emigrants to have his lawless crew come among them, it will be terrible; better rather that they had all gone to the bottom in their ill-fated ship with their drunken captain."

Notwithstanding O'Carroll's opinion, I doubted whether the stranger was the Mignonne, for she was still too far off, I thought, for him to be certain on the subject. I therefore tried to tranquillize his mind, wondering that a man so brave, and cool, and collected, as he generally was, should have such a dread of the French captain.

"I tell you yonder vessel is the Mignonne, and if you had been treated as I was, and had witnessed the scenes I saw enacted on board, you would not have a less horror of La Roche and his scoundrel crew than I have. My reason does not help me; I cannot think of that man without trembling."

I understood him, for I have myself been affected in the same way with regard to one or two people who have done me some injury, or would, I have had reason to believe, do me one should they have the opportunity:

"The only way to escape the pirates is to remain concealed while they are passing," he observed. "As there is no harbour here, and there are no signs of them having been here, they will, in all probability, go to the other side of the island, and we may escape them."

As I still further examined the stranger I began to fear that O'Carroll was right in his conjectures, and I therefore agreed to assist him in trying to persuade the rest of the people to hide themselves till the privateer was out of sight. The emigrants, frightened out of their wits by the account O'Carroll gave of the privateer's men, were ready enough to do as he advised, and began running here and there, not knowing where to hide themselves. We advised them simply to pull down the tent, to put out the fire, and to sit quiet among the rocks and shrubs till the ship had passed.

We then went on to see the captain and his men. As we got in sight of where they were, we saw that they had already got up a spar, which had been washed on shore, and were in the act of hoisting a man's shirt to the top of it in order to attract the attention of the stranger. On this O'Carroll shouted out to them in no very gentle tones, "Fools, idiots! what are you about, would you bring an enemy on shore to murder us?" I then told them the character of the vessel in sight. "What's that to us?" answered one of the men. "All masters are much the same to us; they'll use us while they want us, and cast us adrift when they've done with us. Whether French or Spaniards, they'll not harm us. They'll have liquor aboard, and that is what we sha'n't have as long as we remain here."

It was useless attempting to argue with such men. I turned to the captain. He had lost all authority over his people, who treated him as an equal, or rather as an inferior. He shrugged his shoulders and walked away without speaking. I saw that it was time, therefore, to interfere, and William and I, rushing forward, hauled down the signal, which one of the men was on the point of hoisting. "If you are willing to become slaves, we are not," I exclaimed, in a determined tone, seizing the halliards and hauling down the signal. The men threatened, but as they had no arms, and we were firm, they did not attempt to prevent us from carrying off the spar.

The ship approached, and as she passed along the coast so that we had a broadside view of her, I had no

longer any doubt that she was the Mignonne. I observed that even the seamen, notwithstanding their bravado, kept so far among the rocks, that unless the privateer's men had been especially examining the shore, there was not much probability of our being discovered. We watched the vessel from the highest point of ground we could reach, and we conjectured that she must have touched at the other side of the island, concealed by an intervening ridge of elevated land. "If we are careful we shall escape all molestation from the privateer's men," I remarked, addressing the emigrants. "They are not likely to come to our part of the island."

It was curious to observe the change which had come over O'Carroll. He was no longer the bold and sagacious seaman, but an anxious, nervous, timid man. At night, I frequently heard him crying out in his sleep, thinking that the dreaded La Roche was on him, and was about to carry him on board the privateer. As we could not do without a fire to obtain fresh water, we were compelled to light one, though we thus ran the risk, should any of the privateer's men wander into the country, of being discovered. Still that was a risk which must be run. It was curious, also, to observe the humble way in which, after a few hours, the seamen came to beg for a draught of the pure liquid. I was very glad of this, as I saw that it would enable us to exert an influence over them and to keep them in order. The wretched captain held out for some time, but at last came, with parched lips and bloodshot eyes, entreating even for a few drops of the precious fluid to cool the tip of his tongue. It raised our pity to see how the wretched man suffered, physically and mentally, and all the time without hope. In vain I urged him to seek for mercy as a penitent. "Impossible! impossible!" he exclaimed with a wild laugh. "You do not know what I have done, what I am doomed to do." And tearing himself away from me, he rushed off, and was hid from sight among the rocks and bushes. Day after day passed by, and we kept anxiously hoping that the privateer would take her departure. It was suggested that if she came to the island to refit, that the Frenchman might possibly have a storehouse, with boats perhaps, or means of building one, and that we might thus be assisted to make our escape. At last, so long a time had elapsed since her arrival, that we began to fancy that she had gone out of harbour during a moonlight night, and reached the offing without our perceiving her. To settle the point, William and Trundle volunteered to reconnoitre, and I, afraid that they might venture too far, resolved to go with them. We fixed on that very afternoon to start, our intention being to get as close to the harbour as we could before dark, and then to rest till the moon rose and afforded us light.

"I hope that you'll have success, but it is a dangerous work you are going on, young gentleman," observed one of the emigrants, a Mr. Peter Lacy, or Lazy, as he was generally called, for it was most difficult to arouse him to any exertion.

"Never fear, Mr. Lazy, danger is a sweet nut we midshipmen are fond of cracking to get at the kernel—honour. We shall be back all safe before morning, and able to give a satisfactory report."

In good spirits we set off, for a considerable part of the distance keeping along the shore, to avoid the tangled bush and rocks of the interior. As, however, we approached the harbour, or rather the place where we supposed the harbour to be, we left the beach and kept a more inland course, taking advantage of all the cover we could find to conceal ourselves. At last, the sun went down and it quickly grew dark, so we called a

halt, and ate some of our provisions with a good appetite. We listened attentively, but could hear no sound, so we agreed to push on directly the moon got up. As we did not speak above a whisper, a very soporiferous proceeding, I was not surprised that both Toby and William fell asleep. It was more necessary, therefore, that I should keep my eyes and ears open. At last I saw what looked like the illuminated dome of some vast cathedral slowly emerge from the dark line of the horizon; up it rose, till it assumed a globe-like form, and appeared to decrease in size, while it cast a bright silvery light over the hitherto obscured landscape. I roused up the two midshipmen, who were sleeping as soundly as if they had been in their hammocks. We worked our way onward among tangled underwood, not without sundry scratches and inconvenient rents in our clothing, till we reached a hill, up which we climbed. From the top we looked down, as we had expected to do, on the harbour. Below us lay the Mignonne, or a ship very like her; her sails were loose and bulging out with the land breeze, while from the sounds which reached us, it was evident that her crew were heaving up the anchor preparatory to sailing; boats were moving backwards and forwards over the surface of the calm water of the harbour, on which the moon shone with a refulgence which enabled us to see all that was taking place. The anchor was away, the sails were sheeted home, and the privateer slowly glided out of the harbour on her errand of mischief; two, if not more, boats returned to the shore fully manned. Farther up the harbour lay three large hulks, with their lower masts only standing; they were high out of the water, showing that they had no cargoes in them. There were also several smaller craft, but all were dismantled, and looked as if they had been there for some time. The French, then, had a settlement on the island. The inhabitants were sure to be armed, and probably were as numerous as our party. If so, it would be unwise to attempt gaining anything by force, though of course we might surprise them. We waited till the people in the boats had had time to turn in and go to sleep, and then descended to reconnoitre the place more nearly. We crept cautiously on till we reached several scattered cottages, or huts rather, built, without any regularity, as the nature of the ground seemed most suitable. There were also two or three store-houses close to the water; indeed, we saw enough to show us that there was a regular settlement made by the French for the purpose of refitting their ships. The barking of several poodles in the cottages made us afraid of moving about much, lest their inmates should look out and discover us. We therefore retraced our steps to the hill.

"A magnificent idea," exclaimed Trundle, as soon as we called a halt. "We'll surprise and capture the place and hold it for the King of England. You'll be made governor, Braithwaite, to a certainty."

"To be turned out by the first French privateer which enters the harbour—to be thrown into prison and perhaps shot. Thank you," said I, "I would rather not."

"This establishment solves a mystery," observed William. "We have often been puzzled to know what has become of vessels which have disappeared, and which, from the fineness of the weather, and for other reasons, we did not suppose had been lost. We should do good service if we could get away without being discovered, and send some of our cruisers to watch in the neighbourhood."

I agreed with William; at the same time the idea of capturing the place was very attractive. If we should

make the attempt and succeed, however, we should find liquor there, and the seamen would certainly get drunk and mutinous. No object would be gained, also, unless we could immediately send a vessel to sea, to give notice at the Mauritius of our success and obtain assistance. Discussions on these points occupied us till daylight, when we recommenced our journey to the tents. The news we brought was so far satisfactory to our companions, that we were not likely to be starved to death, and as peace would come some day or other, we might then hope to make our escape. No one, however, seemed at all desirous of attacking the French settlement: the risk was considerable, the gain problematical. It was finally agreed that we should remain quiet where we were, and only in case of extremity make ourselves known to our foreign neighbours. The more energetic of the party became, as may be supposed, very impatient of the inactive life we were compelled to lead. We could do little else than fish all day, and make expeditions in search of water. In this we were at last successful. The spring was more than a mile away, and it became a question whether we should move our camp there, the objection to our so doing being that it was so much nearer the French settlement. The next morning, on going near the spot where the captain and his companions had erected their tent, I saw no one moving. I called to them. There was no reply. I went to the tent. It was empty! It was supposed that they had gone to the newly-discovered spring, but those who had gone to bring water from it told us that they were not there. While we were wondering what had become of the men, as William happened to be sweeping the horizon with his telescope, he cried out that he saw a sail in the offing. In a short time afterwards another was descried, her topsails gradually rising out of the water. She was pronounced to be larger than the first which had appeared.

"It is that scoundrel La Roche again," exclaimed O'Carroll, after eyeing the nearest stranger for some time. "I knew that it would not be long before he would be back again, and there he comes with a big prize, depend on it."

"But suppose, instead of the big ship being his prize, he has been captured by one of our cruisers, and has been sent in first to show the way," I suggested.

"No, no, the headmost craft is the Mignonne, and the big one is an Indiaman, her prize, depend on that," said O'Carroll.

There seemed every probability that he was right, but this did not increase our satisfaction. The only thing that could be said was that we should now have companions in our misfortune. As may be supposed, however, we watched the approach of the two ships with the greatest interest, feeling assured that in some way or other they would have a considerable influence on our fate.

NORWICH SCIENTIFIC CELEBRITIES.

On the eve of the meeting of the British Association at Norwich, our readers may not deem it inappropriate that we should invite them to a rapid glance at some of the celebrities whose names are associated with the East Anglian capital, and whose scientific career have reflected a lustre upon the city of their birth or residence. In the transactions of the Linnæan Society there is an interesting account of several Norwich botanists, in the form of a letter addressed to the secretary of that society, by the late Sir James Edward Smith, himself a distinguished botanist and a native of

Norwich. "There was," says Sir James, "a school of botanists in Norwich, among whom the writings and merits of Linnæus were perhaps more early, or at least more philosophically, studied and appreciated, than in any other part of Britain. Norwich had long, indeed, been conspicuous for the love of plants. A play is extant, called 'Rhodon and Iris,' which was presented at the florists' feast in Norwich, and printed in 1637. The taste for the cultivation of flowers was probably imported from Flanders, along with our worsted manufacture, during the equally unchristian and unwise persecutions of the bloody Philip II. Such an innocent luxury and so pure a taste, were not unworthy of minds which had turned with disgust from the tyranny and foul corruption of their native country. Truth, virtuous liberty, and disinterested science, are congenial, and flourish under the influence of similar circumstances." During last century, botany began to be systematically studied. And here we may notice, before turning to other and greater names, several of those early and humble cultivators of the science connected with the city of Norwich. A portion of the Herbarium of Mr. Wilson, a tailor, fell into Sir James Smith's hands, which he found to be very scientifically named. Wilson appears to have made frequent journeys to London, and to have collected and dried many plants from the Physic-garden at Chelsea, and Gray's nursery at Fulham. Among his pupils were Mr. Christopher Smart, of the same trade; Mr. Christopher Newman, of a more elevated station in life; and Mr. William Humfrey. Sir James acknowledges his obligations to Humfrey—he was the discoverer of several plants not known out of the neighbourhood of Norwich. Mr. Joseph Fox, a weaver, was the first person who raised a *Lycopodium* from seed, and who, without much help from books, attained to a discriminative knowledge of British wild flowers, and was the original discoverer of many rare plants in the county of Norfolk.

The Rev. Henry Bryant, one of the ministers of Norwich, about the year 1764, took up the study of botany as a diversion to his mind after severe domestic affliction. In this pursuit he was associated with Mr. Hugh Rose, an apothecary of the city. Mr. Rose in 1775 published his "Elements of Botany," being a translation and epitome of many of the most useful introductory and theoretical writings of Linnæus. Sir James Smith in early life derived from Rose, books and instruction in botany. To the help thus afforded he makes the following interesting allusion: "I can never forget the kind assistance I received from this worthy man, when, having always had a passion for plants, I became desirous, at the age of eighteen, of studying botany as a science. The only book I could then procure was 'Berkenhout,' Hudson's 'Flora' having become extremely scarce. I received 'Berkenhout' on the 9th of January, 1778, and on the 11th began, with infinite delight, to examine the *ulex europæus*, the only plant then in flower. I then first comprehended the nature of systematic arrangement and the Linnæan principles, little aware that at that instant the world was losing the great genius who was to be my future guide, for Linnæus died in the night of January 11th, 1778. With 'Berkenhout' and a parcel of wild flowers in my hands, I had often recourse to Mr. Rose during the ensuing summer. But, alas! in the following year a gutta serena deprived him of sight."

Mr. John Pitchford, a name known to all conversant with the history of English botany, settled in Norwich in 1769, and died there in 1803. He was the last of the original Linnæan school of Norwich botanists. He had,

says Sir James, a frequent correspondence with the authors of "Flora Anglica" and "Flora Scotica." But though an admirer of Linnæus, he was always particularly partial to Ray; and though ever so well acquainted with a plant by its Linnæan name, he could never rest while it was involved in any obscurity in the works of Ray.

The celebrated Sir Thomas Browne, who had settled as a physician in Norwich in 1636, amid other learned and scientific pursuits also cultivated a knowledge of plants. He first observed the *salsola fruticosa* on the Norfolk coast. Evelyn went to Norwich, as we find it stated in his diary, during the year in which Charles II had visited the city and had conferred the honour of knighthood on the famous doctor. A great desire to meet with the author of "Religio Medici" and "Vulgar Errors," led him the morning after his arrival to seek out Sir Thomas. His house and garden Evelyn describes as "a paradise and cabinet of rarities, and that of the best collection, especially medals, books, plants, and natural things. Among other curiosities, Sir Thomas had a collection of the eggs of all the fowl and birds he could procure, that country, especially the promontory of Norfolk, being frequented, as he said, by several kinds which seldom or never go farther into the land, as cranes, storks, eagles, and a variety of waterfowl. He led me to see all the remarkable places of that ancient city, being one of the largest and certainly, after London, one of the noblest of England for its venerable cathedral, number of stately churches, cleanness of the streets, and buildings of flint so exquisitely headed and squared as I was much astonished at; but he told me they had lost the art of squaring the flints in which they so much excelled, and of which the churches, best houses, and walls were built." In Sir Thomas Browne's works we have several papers of a strictly scientific kind. One is entitled, "An Account of Birds found in Norfolk," and another is descriptive of the fishes found in Norfolk and on the coast. His "Repertorium," one of the very last of his productions, was drawn up with the view of preserving from oblivion, as far as possible, the monuments of the cathedral of Norwich, many of which had been sadly defaced during the civil wars. The "Religio Medici"—the religion of a physician—it is inferred was written before he came to Norwich, and was printed surreptitiously in 1642. In the following year, however, an authorised edition was issued. "The Religio Medici," says Dr. Johnson, in his life of the author, "was no sooner published than it excited the attention of the public, by the novelty of paradoxes, the dignity of sentiment, the quick succession of images, the multitude of abstruse allusions, the subtlety of disquisition, and the strength of language." In 1658 the discovery of some ancient urns led Sir Thomas to write a discourse on "Sepulchral Urns," in which, with his usual learning, he treats of the funeral rites of the ancient nations, exhibits their various treatment of the dead, and examines the substances found in these Norfolk urns. This learned and famous man died at Norwich, October 19th, 1682, in his seventy-sixth year. His last words were expressions of submission to the will of God. His tomb may be seen in the church of St. Peter's Mancroft, with a Latin inscription on a mural monument.

The son of Sir Thomas, Edward Browne, was born and educated at Norwich, travelled widely on the continent, and afterwards became first physician to Charles II. Botany, pharmacy, and chemistry, he knew and cultivated. King Charles said of him, "he was as learned as any of the college, and as well bred as any of

the Court." The published account of his travels is interesting to naturalists from the information it contains. His son, the second Dr. Thomas Browne, was a fellow of the Royal Society and of the Royal College of Physicians, and died in July, 1710.

One of the scientific celebrities born at Norwich in 1510, to whom some notice is due, is Dr. John Kaye, better known by his Latinized name of Caius. He was educated at Gonville Hall, Cambridge, which was subsequently, by his liberality, endowed and erected into a college under the name of Gonville and Caius College. He travelled, studied, and wrote books abroad, and formed an intimate acquaintance with the famous naturalist Conrad Gesner. Returning to England he practised his art as a physician at Norwich with great reputation. On the outbreak of the disease called the sweating sickness, which ravaged the whole kingdom, having discovered a mode of cure, Dr. Kaye generously published it to the world. In the common room of Caius College there is a portrait of Kaye. One of his principal works is a treatise on the University of Cambridge. He produced also a work entitled "De Canibus, or an Account of British Dogs." This book was undertaken at the request of his friend Gesner, and is a masterly treatise for the time in which it was written. In a visit of King James I to Cambridge, as he passed through Caius College, the master, as a compliment to the monarch's learning, presented him with a copy of "Kaye's History of the University," on which the king observed, "Give me rather 'Caius de Canibus.'" Dr. Kaye, in addition to his treatise on dogs, furnished also brief accounts of rare animals and plants for a work by Gesner, which were published separately, with corrections and additions, in 1670. He was distinguished, not only as a physician and a naturalist, but as a linguist, a critic, and an antiquary. On a variety of scientific subjects he exercised his pen. He died in 1573, and was buried in the College Chapel of Caius. In "Fuller's Worthies" will be found a further account of this learned and accomplished Norwich physician.

Passing over a number of names, among others that of Edward King, born at Norwich in 1734, who in an account of his life is styled "the most erudite antiquary of modern times," we come to that of Sir James Edward Smith, already referred to. We have seen how the taste for botany of this eminent man, one of the founders of the Linnæan Society and its first president, was first encouraged and developed at Norwich, by the aid of the botanist Rose. After having received instruction in the city school, Smith, in the year 1780, repaired to the University of Edinburgh, where he distinguished himself by obtaining the gold medal given to the best proficient in botany. Becoming acquainted in London with Sir Joseph Banks, an acquaintance which helped to confirm his attachment to botanical pursuits, Smith, through Sir Joseph's advice, became the purchaser of the library and collections of Linnæus. The ship which conveyed these precious scientific treasures to England had just sailed from Sweden, when Gustavus III, who had been absent in France, returned, and, hearing the story of the sale, sent a vessel in pursuit, but happily it was too late. This splendid acquisition decided the bent of Dr. Smith's studies. In co-operation with other naturalists, he formed the Linnæan Society, which held its first meeting on the 8th April, 1788, when, as first president, he delivered a discourse "On the Rise and Progress of Natural History." The greatest works of Dr. Smith are his "English Botany," which he brought to a successful termination in 1814, and which extends to

thirty-six volumes, and contains 2,592 figures of British plants, and his "English Flora," consisting of four volumes octavo. Dr. Smith had the honour of giving instruction in botany to Queen Charlotte and the princesses at Frogmore. On the 28th of July, 1814, he presented to the Prince Regent a set of the transactions of the Linnæan Society, and received, on the recommendation of Lord Sidmouth, the honour of knighthood. Sir James Smith's contributions to the Linnæan Society have been very numerous. To that body he presented the library and collections of the celebrated Swedish naturalist. "He was," we are told, "a man of deep religious convictions: regularly he might have been seen in his place in the Octagon Chapel in Norwich. In 1796 he had returned to his native city full of information, rich in fame, and loaded with honorary titles. Yet he came, unspoiled by honours, and uncorrupted by travel, to sit down among the friends of his youth, willing to give and to receive pleasure from the most simple and attainable objects." This eminent man died on the 15th March, 1828. A memoir of his life was published by Lady Smith in 1833, in two volumes.

Towards the close of 1865, and within a few weeks of each other, died two very distinguished natives of Norwich, Sir William Jackson Hooker, the Director of the Royal Gardens at Kew, and Dr. John Lindley, Professor of Botany at University College, London. Of Lindley we shall first speak. The son of a nurseryman settled at Catton, near Norwich, he was educated at the Norwich Grammar School, under Dr. Valpy. Appointed in 1822 Garden Assistant Secretary to the Horticultural Society, he became sole Assistant Secretary in 1826, and in one form or another, throughout the whole of his working life, he remained connected with that society, and devoted himself with all his energy to the formation and development of the gardens at Chiswick. In 1829 he was made Professor of Botany in University College, an appointment he held for upwards of thirty years. Exact, clear, and impressive, as a lecturer he excelled in the lucid exposition of his subject, aided as he was by a faculty of copious illustration. Dr. Lindley was one of the most prominent advocates of the new or natural as opposed to the Linnæan system of botany. His Introduction to the Natural System appeared in 1830, it passed through a second edition in 1836, and subsequently took the form of "The Vegetable Kingdom," a third edition of which was published in 1853. In the preface to this work, dated 1845, the author says, "Fifteen years have sufficed to render the once popular but superficial and useless system of Linnæus a mere matter of history."

It was with special reference to his "Vegetable Kingdom," and other valuable writings on botany and horticulture, that the Royal Medal of the Royal Society was awarded to Dr. Lindley in 1857, of which learned body he had been since 1828 a distinguished member. He discharged the arduous duties of a juror of the Great Exhibition in 1851, and in that of 1862, much against the wish of his family, he undertook the charge of the Colonial Department; but the effort was too great, and from the effects of his exertions he never afterwards recovered. On the 1st of November, 1865, Dr. Lindley was carried off by apoplexy, in his sixty-seventh year.

William J. Hooker early showed a love for natural history, becoming the discoverer of a rare moss, which he took to Sir James E. Smith; he received from that botanist the bias which determined the direction of his studies. Hooker was the earliest scientific friend of Lindley. He introduced the unknown Norwich

youth to Sir Joseph Banks in 1819, and so commenced Lindley's successful scientific career.

In the spring of 1809, Sir Joseph Banks proposed to Hooker that he should spend the summer in Iceland. This he did, and to Banks, then president of the Royal Society, the "Journal of a Tour in Iceland" is dedicated by the author. In a sojourn for nine months on the continent, Hooker made the acquaintance of the principal botanists of Europe, with whom he maintained scientific intercourse and correspondence until the day of his death.

Possessed of independent means, having married and settled at Halesworth in Suffolk, his house became the rendezvous of British and foreign botanists. There he commenced the formation of that great Herbarium, now located at Kew, and the finest in the world. Professor of Botany at Glasgow from 1820 to 1841, in the latter year Sir William Hooker (who had been knighted by William IV in 1836) was appointed director of the Royal Gardens at Kew. For making these gardens the head-quarters of botanical science for England, and, indeed, for the empire, for raising them to their present high position, and for throwing them open to the public, the nation is mainly indebted to the administrative and scientific capacity of Sir William Hooker. The history of the Kew Gardens furnishes, indeed, the best tribute to his rare personal qualities and scientific merits. Here, however, we cannot enter upon this inviting subject, nor upon any notice of Sir William's botanical writings and varied labours. Let it suffice to transfer to our pages the following description of the appearance and habits of the late director at Kew. "Sir William was in person tall, athletic, and active, in features remarkably good-looking, animated, and cheerful; his conversation had the charm of intellectual cultivation and refinement, and he had a ready power of conveying clear information. As a scientific correspondent he was unrivalled, promptly answering every letter with his own hand, encouraging those who first addressed him, and stimulating those who flagged. Indeed, he was wont to attribute his success in the creation of the National Gardens and the accompanying museums, to his habit of thanking every contributor at once, answering all their questions at whatever trouble, naming the plants they sent, and applying personally to residents in every part of the world for such plants or their products as he desired to have in the gardens."

A name which requires a passing notice in connection with the meeting of the British Association at Norwich, is that of John Taylor, born there in 1779. This gentleman devoted his attention to the operations and processes followed in mining. His aim was to elevate the art, and to place it on a scientific basis. To his earnest and judicious representations, although he had no active share in the matter, the establishment of the present school of mines may be traced. Of the various societies to which Mr. Taylor belonged, the British Association has been the most indebted to his useful co-operation, both scientific and administrative. He was present at its birth, and the first meeting of its Council was held in his house; he was its first treasurer, and held office till September, 1861, when the infirmities of age constrained him to retire; on which occasion the Council joined in a cordial expression of respect for his character, and gratitude for his long and valued services to the cause of science. Mr. Taylor died in London in April, 1863.

Edward Stanley, before rector of Alderley, Cheshire, was Bishop of Norwich from 1837 till 1849. That he deserves a place in our enumeration of the scientific

celebrities of the city, will be evident from the following extract from a biographical memoir by his son, Dean Stanley:—

"Of all the branches of science, natural history was that to which he was most inclined. His quick eye enabled him readily to observe, and his methodical habits accurately to register, the phenomena of the animal creation, and thus to acquire, without interfering with graver pursuits, a very considerable knowledge of ornithology, entomology, and mineralogy. Ornithology in particular became his favourite study, and it was a constant source of amusement and interest to him, in his parish walks and rides, to notice the flight and habits of birds, to collect remarkable specimens of their organisation, and to gather from his parishioners stories of any peculiarities which they had themselves noticed. The result of these observations he embodied in 1836 in two small volumes, published by the Society for Promoting Christian Knowledge, and entitled "A Familiar History of Birds, their Nature, Habits, and Instincts."

Bishop Stanley's work has gone through several editions. It is written in a most interesting style. We do not know any book so well suited to create on the part of the young a taste for the study of birds, and an observant eye for their peculiarities and habits.

Some notice in our sketch is due to the late Samuel Woodward, the author of "The History and Antiquities of Norwich Castle," a work published in 1847, and edited by his son, Mr. Bernard B. Woodward, librarian to Her Majesty the Queen. Another member of this talented family, who attained the highest position as a conchologist, was the late Samuel P. Woodward, an officer of the British Museum, author of a treatise on recent and fossil shells, published under the title of a "Manual of Mollusca." This gentleman, on account of his scientific merits, twice received the proceeds of the Wollaston Fund from the Geological Society of London.

A GLANCE AT THE COUNTY OF NORFOLK.

WITH the exceptions of Yorkshire, Lincolnshire, and Devonshire, Norfolk is the largest county in England, comprising an area of more than two thousand square miles. In an agricultural point of view it has long been foremost among English counties; and it owes its pre-eminence in this respect in part to improved systems of cultivation, said to have been borrowed originally from the Flemings, but still more to the practice of granting long leases to farmers, a practice in which Mr. Coke (the late Lord Leicester) led the way, and which, while it proved highly conducive to his own interests, gained for him the title of a benefactor to his country.

The history of Norfolk, on which we can here but barely touch, is replete with interest. Anciently it formed a part of the dominions of the Iceni, who were allies of the Romans in the time of Claudius, but rose in arms against Ostorius, who subdued them. A more terrible rising followed under Boadicea, whose calamitous defeat led to their entire submission. The relics of Roman rule throughout the county, such as the sites of towns, castles, stations, and fortifications, are abundant, and are the chief sources of interest to the antiquary. There are also many traces of Roman and other ancient roads, as the Jedder, or Pedder's Way, Stone Street, the Ikarild Street, and others which figure in the maps of the old Itineraries. There is good reason to believe that the Saxons obtained a

settlement on parts of the Norfolk coast even before the overthrow of the Roman empire. After the | than those to the shrine of St. Thomas à Beckett. Among the pilgrims were several kings and queens of England

WALSINGHAM ABBEY.

conquest of England by the Saxons and their kindred tribes, Norfolk, Suffolk, and parts of some adjacent counties were formed into the kingdom of East Anglia, which became consolidated into a monarchy about A.D. 571, when Uffa is the first who is spoken of as king. Of the Saxon era the remains are as numerous in Norfolk as in any part of the country, while of the Danes who followed in the career of invasion and conquest, the chief characteristics still observable are found in the terminations of the names of places, as *by, hoe, sted*, common alike in Denmark as in Norfolk.

But we must cut short our historic survey, and direct the reader's attention to some few of the objects of interest which will probably be made the subjects of investigation by men of science during the present month. First among these comes Walsingham, a name familiar to curious readers in connection with the famous work of Sir Thomas Browne, entitled "*Hydriotaphia; or, Urn Burial*," a work which owed its existence to a discovery made more than two hundred years ago. In a field at Walsingham were dug up between forty and fifty urns containing the remains of human bones and other relics; burnt substances were found on the same spot, and hence it was conjectured that this was the *Ustrina*, or place of burning, where the Druidical sacrifices were made. On this subject the author discourses—his reflections on death, oblivion, and immortality being probably unsurpassed in English literature. At Walsingham (in the hundred of North Greenhoe), consisting of Great and Little Walsingham, adjoining each other, are the remains of a monastery founded in the reign of William the Conqueror, which once contained the shrine of "Our Lady of Walsingham," to which shrine pilgrimages were even more frequent

and foreigners of note. The monks persuaded the people that the Milky Way in the heavens was a

CAISTOR CASTLE.

miraculous indication of the road to this place, whence it came to be called by some "the Walsingham Way." The ruins of the old pile, which are very fine, are for the most part included in the pleasure-grounds of Walsingham Abbey, the seat of the Lee-Warner family.

(Shakespeare) about the middle of the fifteenth century. It was constructed chiefly of brick, and it is thought to be one of the oldest brick edifices in the kingdom. It stood two sieges during the wars of the Roses. The larger portion of it has long been levelled with the

CROMER.

Another ecclesiastical relic is Binham Priory (five miles south-east of Wells), founded by a nephew of the Conqueror for the Benedictines. The ruins are very considerable and most interesting, but are gradually mouldering away. Other monastic remains are those of Langley Abbey, of St. Bennet of Hulme, of Beeston Priory, of Flitcham Priory, of Brownholm Priory, and more that might be mentioned, the ruins of some of them containing rare examples of the early English style.

Castle Acre, in the hundred of Freebridge Lynn, is supposed, from the coins and tesseræ found there, to have been a Roman station. The castle was built by William Earl of Warren, or Warenne, and Surrey, and some fragments of it yet remain. The same earl founded a priory of Cluniac monks near the castle, and the remains of this religious house cover a considerable space of ground, the site of the monastery within the walled precinct having comprised originally nearly thirty acres. Castle Rising, also in the hundred of Freebridge Lynn, is a place of great antiquity, an old rhyme declaring it to have been a seaport town when Lynn was but a marsh. Tradition states that Alfred the Great built a castle here, but this tradition may have been based on the fact that the ruins of a castle built by William de Albini, some century or more after the Conquest, appear to enclose a fragment of some more ancient structure.

At Caistor, three miles from Yarmouth, stand the remains of Caistor Castle, which was built by Sir John Fastolf not to be confounded with the fat knight of

ground, but an embattled tower at the north-west corner, one hundred feet high, and the north and west walls, remain, their present proprietor using every means for their preservation.

Thetford, in the hundred of Shropham, Norfolk, and the hundred of Lackford, Suffolk, is a very ancient place. It was called Theodford by the Saxons, and evidently derives its name from the Thet river, which joins the Lesser Ouse near this spot. It is considered by antiquaries to be the site of the *Sitomagus* of the Romans, who held it in 435, and it is known to have been the metropolis of East Anglia. On this account, and from its nearness to the coast, it was frequently attacked by the Danes, who, after retaining possession of it for fifty years, destroyed it by fire in the ninth century. It was burned a second time by Sweyn, on his invasion of East Anglia in 1004, and six years later suffered a like calamity at the same hands, after a signal victory obtained by the Danes over the Saxons. In the reign of Canute, Thetford began to recover from the effects of these misfortunes, and in that of Edward the Confessor had nearly regained its former importance. It continued to prosper, and its prosperity is evidenced by the fact that in the reign of Edward III it contained twenty-four good streets, twenty churches, eight monasteries, and other religious foundations. The relics of antiquity now remaining consist chiefly of fragments of the nunnery founded in the reign of Canute by Urius, abbot of St. Edmund's, of which some of the walls, buttresses, and windows, with a fine arch and cell, are still visible. The conventual church has been converted into a barn.

Of the priory or abbey founded by Roger Bigod for Cluniac monks, the gateway and part of the church alone remain. Of the monastery of St. Sepulchre, founded in 1109, the church has been converted into a barn. Of the other religious edifices no traces can be distinguished. At the eastern end of the town are the remains of an ancient Danish fortification, which consisted of a large keep and double rampart raised on an artificial mound a hundred feet high; the ramparts are twenty feet in height and the surrounding fosse seventy feet in width.

Lynn (or King's Lynn), a seaport and market town in the hundred of Freebridge, is supposed to be an ancient British town, and to have derived its name from the expanse of water near it. It was formerly *Len Episcopi*, or Bishop's Lynn, from having been under the jurisdiction of the Bishop of Norwich. It stands on the banks of the Great Ouse, at a distance of ten miles from the North Sea, and was anciently defended on the east side by a wall in which were nine bastions, and by a broad deep fosse crossed by draw-bridges leading to the principal gates. In the town and its environs are some interesting vestiges of religious edifices, among which is the hexagonal tower of a monastery, which serves as a landmark to vessels bound for the harbour.

Hunstanton is situated at the north-west point of the county, on the shore of the Wash. It is remarkable for the peculiar constitution of its cliffs, which are composed of different strata, two of them being of red chalk. About two miles north of the cliffs are the remains of an extensive forest submerged by the sea, and which once extended across the Wash as far as the coast of Lincolnshire: the fragments of horns and bones cast up by the tide show that this submerged tract was at one time pastured by deer and oxen.

Hunstanton has belonged for seven centuries or more to the L'Estrange family, whose mansion, dating from the end of the fifteenth century, is worthy of note. About thirteen miles from Hunstanton is Holkham Hall, the seat of Coke, Earl of Leicester; at the same distance in another direction, is Houghton Hall, built by the celebrated Sir Robert Walpole. Near this is the Wolferton Station, about a couple of miles from which is Sandringham, the Norfolk seat of the Prince and Princess of Wales.

Near the north-east limit of the county stands Cromer, in the Erpingham hundred. Near the site of Cromer formerly stood Shipden, a small town which was destroyed by the sea in the beginning of the fifteenth century. This neighbourhood is interesting from the fossil remains found on the coast, and for the general advance of the sea upon the land. Many dwellings have been destroyed in the memory of persons now living, and at very low tides large masses of mason work are visible.

Other places likely to present attractions to scientific persons are, Caistor near Norwich, Bramstone Pits, Thorpe chalk-pit, Hoxne and the flint-pits, and Burgh Castle; which last-named place, however, is not in Norfolk county, but just on the Suffolk border. At Castle Rising are the remains of the feudal fortress of Eleanor, the faithless queen of Edward II. Burgh Castle is one of the most ancient in the kingdom, having been erected in the reign of Claudius Cæsar. Its walls are more extensive than those of Richborough; they are nine feet in thickness, and are faced with flints interlacing the masonry. Many Roman coins and other articles of Roman use have been from time to time found within their enclosure.

GEOLOGICAL EXCURSIONS IN NORFOLK.

THE proverbial excellence of Norfolk farms, and the yearly consignment of 50,000 turkeys and geese during Christmas week to the railway terminus in Bishopsgate Street, prepare and console us at once for the absence of the picturesque in East Anglia. Low chalk plains, succeeded by gravel beds, and often ending in mud cliffs, do not promise much adventure. The crumbling coast, the patches of soft-looking woodland, the inland "broads" of estuary water, the windmills, and the flint churches, with here and there a wide heath, make up many pleasant pictures, however; and the tale of the past, which even the newer formations tell, is sufficiently marvellous to arrest and repay attention.

1. Plunging into the pre-historic, we first alight at Hoxne, in Suffolk, amidst mammalian gravel. This has become famous since the Abbeville discovery of worked flints in the gravel, associated with mammoth remains, and of presumably contemporaneous origin with the latter. On this being announced, it was recollected that in 1801 a similar discovery had been made at Hoxne, and registered in the proceedings of the Royal Society. Explorations were resumed, and more flint implements and bones of bygone mammals were found. The localities where this has occurred in France and England are now numerous. They are all in the valley gravels of the very latest geological period. In India similar tools have been found in consolidated beds of a kind of gravel, all along the eastern coast for 300 miles from Madras southward. Man must have inhabited or occupied the land before the last great physical changes of level in both east and west.

2. Our next excursion will be to the boulder-clay, the great drift formation of sand, stones, and rubble, which has been dragged or dropped over the whole district by glaciers and coast ice during a very long period antecedent to the mammalian gravels. It may be well studied at Happisburg, or at Cromer, or on the Suffolk coast. The lower portion is usually a dark tough clay, with fragments of all kinds of rock in it, and their fossils. It is a drag net. The explorer may collect bits of the Scottish mountains, of the Grampians, of the Cheviots, of the coal-grits, and abundant oolitic fossils, which have been forced along by the great tyrant. Occasionally there are in it sandy beds with Arctic shells, showing periods of repose. The dark cliffs south of Lowestoft, the bright yellow cliffs at Gorleston, the ruined rusty cliffs south of Cromer, the fine cornlands spread over the whole inland, are principally boulder clay, with a thin capping of alluvial recent gravel and occasional nests of the thicker mammalian gravel, and its accompaniment the brick earth.

3. At Mundesley is a post-glacial deposit, formed in a hollow of the marine drift, which will doubtless attract tourists. A valley has been worn in this, and layers of gravel, sand, and peat successively deposited in the hollow by the action of fresh water.

4. Wherever the traveller lights on the coast, from Gorleston to Weybourne, he may notice at intervals dark patches below high-water mark of dirty-looking decayed stuff. This is a land surface "Forest-bed" which preceded the glacial period. The slightest observation will show the existence of hazel-nuts, roots of trees and ferns, decayed wood, fir-cones, and wings of insects. More careful research brings to light bones and horns of animals. The remains of two kinds of elephant, of the rhinoceros, hippopotamus, walrus, narwhal, whale; of the yew, sloe, the water-lily, prove that this was the beach of a low swampy territory, with

a deep sea lying off, whence were washed up the relics of marine creatures to meet the land spoils of a district abounding in game and shelter. We have shells of fresh-water ponds, forms of beautiful plants from the marshes, the beaver and deer abundant.

5. But the speciality of Norwich is its *crag*—a provincial name for gravel, but now a geological term for a mass of sand, shells, clay, and broken fragments, extending from Northern Germany to East Anglia, assigned to the *Pleiocene* period of Sir Charles Lyall, *i.e.*, to the latest tertiary, when the organic life was nearly altogether like that of the present day. The uppermost *crag*, the Norwich *crag* proper, may be seen on the banks of the Yare, below the city. It is sand and gravel mixed with sea shells. The surface of the chalk on which it lies is perforated by the drills of the pholas, the same as now found in the blocks of chalk on the shore: the creature's shells are still in the bore-holes. The shelly deposit contains 85 per cent. of present sea shells. They are principally forms of marine life indicating a lower temperature than now prevails off the coast. But the marvel is to see what kind of bones have been drifted from adjacent land on to this old beach. They tell of mammoths and of an assemblage of creatures of African aspect, though adapted to colder climates. Three species of elephant, a hippopotamus and rhinoceros, once camped on these grounds, together with horse, bear, wolf, elk, a quantity of small deer, and other creatures. About half of these belong to species now extinct. The Norwich *crag* may be seen at Cromer, rising from the beach, and gradually ascending in the cliffs towards Weybourn. It is a very local deposit.

6. The next *crag* is of wider range. It lies below the Norwich or mammalian *crag*. It is named red, or Suffolk *crag*, and is that which is so well seen in the cliffs at Walton and Felixstowe. It is a most tempting deposit for collectors. No hammer is needed, nor any scraping or washing of fossils. The shells are, save as to colour (and in some cases there are traces of this), as well preserved as in a cabinet, a little iron-stained, but wonderfully delicate in their beauty. One, the *crag* spindle shell, *fusus contrarius*, is sure to attract attention, as it uniformly has its opening on the reverse side, so that our modern whelk-eaters would have to extract the fish in a left-handed manner, had they still been presentable on the hand-barrow of the costermonger. Teeth of sharks, and ear-bones of whales, are among the common spoils of the *crag*. There are 240 species of mollusca found. About fifty of these are travellers rolled in a fossil state from previous formations, and of shells proper to the deposit, about fifty-seven per cent. are of recent well-known species. It is excellent occupation for the seaside, to collect and sort out the *crag* shells, dividing off the casuals, and then ascertaining the character of the true parishioners. The reader will easily credit the statement that this is safer work now than it would once have been, for among other creatures whose bones we handle is a great shark, computed to be sixty-five feet in length, with a jaw-gape three feet by four.

7. To see the lowest *crag*, the Coralline, we must visit Woodbridge and spend an afternoon between the rivers Alde and Stour. It is a mass of sand and shells, sometimes hardening into building stone. The greater number of the shell-animals are still to be found in our seas. There are proofs of a gradual refrigeration of temperature from the base of the *crag*s up to the boulder-clay.

At the base of each formation of *crag* there lies a bone bed—a quantity of broken animal remains, con-

taining phosphatic matter. The late Professor Henslow first noticed this material in 1843, and indicated it as a source for manure. From that time there has been a continuous resort to these bone beds for "coprolite," as it is called. It is used, like guano, for manure, and is now well known as a source of wealth and an article of manufacture and use. The geologist may sigh as he sees the heaps of fish teeth and bones daily consumed by the manure mill, but he has his compensation in boiled beef and turnips, to say nothing of wheat and clover.

8. The London clay, underlying the *crag*, will hardly afford interest enough in this county for an excursion. Its classic hunting-ground, for turtle and cinnamon-groves, is at Sheppey, in the mouth of the Thames.

9. The underlying chalk is the prevalent subsoil of the county. It is the upper chalk, with large flints and layers of flint, whence arises the characteristic flint architecture of East Anglian churches, and especially the squared flint of the towers, as at Southwold. The chalk rises into cliffs at Cromer, and is singularly furrowed and worn into pinnacles, surrounded by the upper clays, as though it had formed a furrowed coastline like that of the Needles, and then had become the bottom of the sea by tranquil subsidence, and been covered with sand and mud by gentle degrees.

10. On the edge of the county, towards the north-west, the lower cretaceous formations crop up. At the northern end of a ridge lies one of the favourite localities of the fen-folk, and one of the notabilities of cretaceous geology—Hunstanton, with its cliffs of red chalk. How the white chalk, the soft ocean-floor of the great limestone sea, became discoloured by iron-rust; how it is preceded by red clays, containing lower cretaceous fossils; and how interesting the whole deposit is—are topics which may well elicit the investigation of the assembled *savans* and of their numerous camp-followers.

S. R. P.

MOTHER'S WORK;

OR, THE EDUCATION OF THE HEART.

CHAPTER III.—TRUTH AND JUSTICE.

I HAVE classed together truth and justice as elements of character. It is difficult to separate them so as to bring either under notice as a distinct quality, because truth is justice in speech, and justice is truth in action. They are also found together. Where there exists a strict regard for truth, there will be a strict regard for justice; and where justice is faithfully maintained, there will be truth. It will equally be found that laxity or carelessness about one, will manifest itself, as occasion may serve, in carelessness about the other.

Simply considered, nothing can be more positive than truth; but when carried out into action, truthfulness consists in guarding against falsehood. It is only speaking of and dealing with things as they are, and that under all inducements to speak of and deal with them as they are not. Justice also is the acting out of that which is strictly due and right, under all temptations to do otherwise.

The temptations which operate against both these methods of doing simply right, arise out of selfishness—that first principle of our common nature. It is not likely that any one would speak falsely rather than truly, unless in the first instance it should be to gain something which is desired, or to escape from something which is disliked or feared; although when the habit of being false has become established, it is an undoubted fact that persons do sometimes grow to prefer

speaking falsely, and that with them a lie is often told from choice.

In the same way, injustice is generally done because of some selfish object to be gained, some purpose carried out, or some step taken towards a desired end. Self-serving, under some plea or other, is the cause of deviation from the line of rectitude in both cases. The peculiar form taken by temptation in both will depend upon the prevailing character of the society in which a person moves.

The peculiar temptations by which truth and justice are assailed in the present day, and in ordinary life, arise chiefly out of the increased demand for luxury and indulgence in our modes of living; the great facility with which the luxuries and elegancies of life can be obtained, rendering it a kind of stigma upon individuals to live in these respects below the grade of society in which they mix.

In conversing with persons who have these matters much at heart, we not unfrequently find them proposing to lessen the temptation by beginning, as it were, at the wrong end of the stream, by attacking the flood instead of the source. They even lament over this excess of luxury and self-indulgence; while, on the other hand, we hear persons who are equally anxious to promote the welfare of their fellow-beings, rejoicing over every improvement of trade, or extension of commerce, or ingenuity of invention that will increase the facility by which luxuries are obtained. Altogether there are moral perplexities in connection with this subject sufficient in number and complication to confuse the wisest and the clearest heads amongst our philanthropists and politicians.

Let us turn again, for relief, to the nursery, the home, and the mother's holy work. Happily for her, she is not called upon to disentangle the knotty questions of the political economist. But she is called upon to prepare her child, as well as she can, for that great battle against temptation which he will have to carry on throughout his after life. As already said, it is of the utmost importance to ascertain what these temptations will be, socially considered—in other words, what will be the nature of those temptations most likely to assail him from without, as the inevitable result of mixing in society as it is. He will still go forth with his own peculiar temptations, springing from within himself, and what these will be neither mother nor child will probably know until the hour of trial.

In our day there are facilities for deception, treachery, and secret crime, which are supplied by that material prosperity in which we so often exult. To guard against these facilities, we require, year by year, a stronger moral power, a stricter integrity, a firmer hold upon the principles of truth, as well as honesty, in order to withstand the temptations by which age as well as youth is surrounded, and, with terrible frequency, is overcome. This preventive and preserving power must come from within—from the heart; and the heart is treacherous and false, not all the restraints in the world can make the actions which it dictates true, and right, and noble.

But the memory of his mother may reach the tempted one; the example of his father; the moral purity of his home; the heart-lessons of his childhood; the practical uprightness of those who suffered in that home, and bore their trial of privation as sent from God, and who would not, to save their lives, have laid their hands upon a loaf of bread that was not their own. He may not be able to recall any direct precept on the subject, because integrity of principle was rather a

part of that moral atmosphere which he lived and breathed in during childhood, than a distinct thing to be set forth in lessons or even in words.

Invaluable in amount is the weight which a strict regard to the claims of property would throw into the right scale of that balance which a wise mother has to hold in her hand. Loose, vague notions about mine and thine, about property in general, are always dangerous to youth. It is better that a child should possess little, but that little should be as truly its own as the father's property is his own. Indiscriminate taking, using, and appropriating in a family, may wear an agreeable outside appearance of unselfishness and liberality, but it is often far from being so in reality. Out of such confusion of property there will arise confusion of claims, and then will follow disputes and quarrels. Neither is there any true generosity in the giver where all is held in common; and it is most essential to the cultivation of a true and noble generosity that a child should learn to give, and should delight to give out of that which is really its own; the smaller that is in amount, the larger will be the generosity of heart with which it is freely given.

Strictness in regard to borrowing and returning, is another guard which the judicious mother may set around her child; also a scrupulous care to repair any injury which a borrowed article may have sustained, and to replace it if lost or destroyed. It is surprising how careless the children—yes, even the grown-up children of respectable homes—are sometimes found to be on these points, and how grudging they show themselves when restitution is required. Had the education of these individuals in very early life been such as to inspire within them a high sense of the *rightness* of such acts of justice, and the *wrongness* of an opposite course, they would in all probability have grown up ashamed, as they ought to be, of failing in the minutest particular as regards absolute rectitude on such points.

It is not that the merit of being just is so great as to demand much commendation, because, as already said, to be just is only to be right; it is only the avoidance of wrong. But the shame, the condemnation, should be all the greater for having deviated from the line of right so far as to appropriate another person's property, to injure it, or to fail to make restitution for its loss.

The prompt and cheerful payment of all just money demands, where made the habit of a family, has great influence in the formation of character upon a true and honest basis. Teaching a child to feel that that money is absolutely not our own which is owing to another person for anything we are using or have used, is of great help here; and I think the payment of such debts might be cultivated as a pleasure to the child, at a very early age. As, for example, it might be made a privilege to the child to go with its mother or its nurse when they pay for the new shoes it has just put on, and with which, as in most cases, it is highly delighted.

But in whatever way the strict line can be drawn between what is honest and dishonest, no opportunity should be neglected for making it a heart-work with the child to be true and honest in these matters. It is of no use setting the head to calculate upon them. Such calculation will be more likely to lead to this result than any other—that on such a day a certain thing shall be restored; that it will not be wanted earlier; that it is not worth much to anybody; or that the owner will most likely never think of it again. This is all natural, and it seems innocent enough in a child; but it is the way a child should never be trusted

to go, because it is in reality one of those little by-ways of life, by pursuing which so many find themselves upon the great high road to ruin.

"I am only borrowing this money. I shall restore it long before the day when it will be wanted," said the wretched victim of crime on the day when he first laid his hands upon the money which he had in charge. "I will pay for what I am purchasing when my next supply comes in," said another who, on that day, had not the most distant idea of ever being imprisoned as a debtor. "I will risk all that I have, and twice as much, of my father's or my friend's, on this hopeful venture," said the eager speculator on the time when a promising investment was proposed to him, little thinking that a day of ruin for those friends, as well as for himself, was at hand—a day when nothing would be left for restitution. In all these cases, and in the thousands of others of a similar nature which stain our public annals, and wreck the happiness of families, and undermine the foundations of confidence and esteem, the stern work of rectitude should have done at once; the conscientious scruple should have been at work for years before the day of temptation; the mother's influence should have been upon that heart, and her careful skill should have guarded it, as by a wall of fire, against the assaults of this enemy.

Out of the heart must come the strong impulse to avoid all dishonesty as an abominable thing. There must early be implanted in the heart of the child an absolute hatred of every species of dishonesty—a hatred of its meanness, as well as its wickedness. All children can easily be made to despise; nothing, in fact, is more easy. The little lip will curl, and the haughty head will be tossed with ineffable contempt. Here, then, we find another instrument which, in the hands of the mother, may be used with wonderful effect against whatever is touched with the least taint of dishonesty, only the instrument must be applied, not so much to the conduct of others, as to the little dishonest acts of the child itself.

When I say it is natural to speak the truth, I mean only until some inducement stronger than the love of truth itself shall come across the purpose of a child to tempt it to tell a lie; and alas! this comes too soon. I only mean that if we should ask a child if it had learned a lesson, had been out, or had seen a bird, it would be in accordance with the first impulse of nature to say yes, if it had, unless some motive should be in immediate operation to prompt a lie. And, perhaps, it is in this way that parents are lulled into security, concluding that *of course* their children will be truthful; it is so very wicked to tell lies, and they have seen no reason to consider their children wicked.

How shall we convince the fond and partial parent that this is not sufficient? It may be sufficient while the child is free from temptation; but, when the hour comes in which there will be some terrible thing to fear in consequence of speaking the truth, or some delightful thing to gain by a falsehood—when other people tell such falsehoods, and no harm is thought of them—when it seems as if some particular falsehood would prevent mischief and pain, nay, actually do good—when nobody need ever know—then will be the time for the child to be saved, humanly speaking, by its intense and habitual hatred of a lie, indeed of everything false, by its remembrance of how falsehood was regarded in the parental home as a base and abominable thing, and how truth was acted there, as well as spoken, independently of all calculation of consequences, simply because it was truth.

In the constant and habitual acting out of truth as a principle lies the great secret of influencing the character of a child, so that truth shall be loved, and falsehood hated. Perhaps few of us are aware, until we look faithfully into the subject, and examine it well, how frequently we fail in this consistent acting and speaking, and how we fail so as that a child can easily detect our failures.

I think one of the great points on which we fail is this—we too often substitute anger for sorrow in our treatment of the misconduct of children. Take, as an example, the telling of a lie, or perhaps more than one. Fearful judgment is sometimes visited upon children for this, so fearful that the next time they tell a lie, perhaps inadvertently, they become so terrified that in all probability they tell another, or a succession of lies, in order to sustain or cover the first.

It seems to me that we work with a mean instrument when we attempt to work upon the *fear* of a child, and whatever we do, we must not degrade or debase the character. There will be degrading influences enough in the world to meet him at every step; but the mother's work should be exalting, noble, always tending upward. Surely then sorrow would be better than anger in the case described; and if we ourselves are deeply impressed with the importance of truth and falsehood, there will be cause enough for grief and real sorrow in the falsehood of any child in whom we are deeply interested.

I have often thought that a solemn grief pervading a household when a child has done wrong would have more effect in preventing a recurrence of the fault than all the anger in the world, or even the severest punishment. And yet there are cases, not very rare ones either, when a child is punished, perhaps left to sit alone in the school-room, because it has told a lie, while the rest of the family may be heard making merry as usual, laughing, it may be, with their guests, and certainly evincing no sign which the culprit can detect of the least feeling of sorrow on their part. A child so treated will know so far as that it has personally offended or vexed those who inflicted the punishment which it is enduring, and this it will probably charge upon their ill-temper rather than its own fault, but it can learn very little by this mode of heartless treatment of the awful nature of falsehood as it ruins the character, and stains the life.

Opposed to this we have the beauty and the value of a truthful and upright character. We have the holiness of the law of God, in nothing more visibly pure to our perceptions than in its maintenance of truth and justice—the just man and the perfect being always placed in the clearest opposition to the liars and the father of lies. We have also the *kindness* of truth in contrast to the *cruelty* of falsehood; nor can it be difficult to show to a child how cruel falsehood really is, that having been deceived once, or twice, or three times, we cease to be able to believe when we would, and so turn a deaf ear to the cry of real suffering, or refuse the petition of the needy, or withhold our confidence from those who are really deserving of our trust.

Truth admits of no qualification. It is simple truth, as day is day, and night is night. Thence it may be made clearly intelligible to a child. Justice is more difficult, involving as it does so many relative circumstances, and so many complications arising out of social life. There are, however, cases occurring frequently—perhaps in the nursery, from which a child may be so taught as to derive useful lessons. And, after all, it is not so much the discrimination of a clear

case which the mother has to teach, as how to feel about it when clearly seen. Discrimination of cases belongs especially to the head; and, although both head and heart should be included in the great work of education as it moves on, the business to be done in early life is chiefly to work upon the heart, so that it shall love truth and justice, and hate their opposites. A desire will thus be established to follow after, and hold fast by, that which is beloved and approved, and to reject the other with dislike and contempt. According to this mode of educating, a child may be brought to love and admire justice, long before it can have attained any great amount of power in judging correctly for itself as to what is just or unjust in the general transactions of mankind.

For this reason—that a child can really be no judge in transactions of business, or in worldly matters generally—the great mistake is made of leaving all considerations about justice, as well as many other moral questions, until the mind is mature, and the character to a great extent established. This fearful and often fatal mistake is chiefly attributable to the almost universal notion that little or nothing can be done in such matters except by the education of the head, that all these things will come right if the child is sent to what is called a good school, and that if properly taught, according to the accustomed routine of scholastic teaching, that the character of the future man or woman will be as good as human instrumentality can make it.

Does the mother ever think, when she consigns her child to this method of preparing it for after life, that even if the thing was stipulated for, which it seldom is, there could be neither time nor opportunity for educating the heart of her child as she could have done that work at home? That the head will be constantly practised at school in the lessons it is learning, the learner sent back again, perhaps a hundred times, until he is thoroughly grounded in his lesson, and so on, from step to step, each lesson made the groundwork for another, but all impressed, and made as sure as incessant labour, stimulated by competition, can make them? While the heart all the while is only *told* a few uninteresting truisms, and not practised at all, or with any method in its education?

Does the mother ever think, when she walks in her garden on a fine spring morning, and watches the fair blossoms unfolding on the boughs, and calculates upon her autumn and winter fruit, that the most critical time of all the year as regards the produce of the garden is just when those blossoms are beginning to *set*, as the gardeners call it? With blossoms a thousand times more beautiful, with the promise of fruit a thousand times more precious, she has the setting-time, as it were, in her own hands. It may be long before the casual observer will see what she has done: The blossoms of the fruit-tree fade and fall, and the small germ of promise makes no show for some time after this critical period; but amongst the many secrets hid in the bosom of nature, there is none more sure than this, that unless the fruit has *set*, there will be none upon the tree.

So, deep within the mother's bosom may lie this precious, this soul-sustaining truth, that her young blossoms have been cared for, nourished, and guarded in their setting-time; that nothing has been wanting on her part to secure a rich supply of after fruit; and that amidst her toil—toil sweetened by her love—she has constantly prayed for that blessing on her work without which she could have no hope of its success. The care, the watchfulness have been hers, and hers, too, the

skilful turning to account of those ever-changing circumstances of nature which belong to shade and sunshine, storm and calm. Beyond this, there must be the breathing of the breath of life, the inspiration of God's own spirit, to complete the work, for which she can only wait, and trusting in his promises, still work, and pray.

MY FIRST CURACY.

CHAPTER IV.—SUPERSTITIONS.

Now death was rather a rare visitor in these districts, for people, notwithstanding the want of drainage, and the scarcity of water, if they managed to escape death in childhood, generally lived to extreme old age. It is a positive fact that I heard one old farmer of the age of eighty-nine, speaking to my vicar and telling him that he was busily engaged in breaking in a colt for his own riding. And he did break in and ride this horse, till within a few weeks of his death, when he had attained the ripe age of ninety-six. I remember, too, another case of an old woman, Sally Camp by name. When she was ninety-two years of age she used to continue to filch sticks from the hedgerows, and would even pull up the stout stakes put round a rick to protect it; and these she would often carry away in as great a load as would be heavy for a stout strong lad. In her earlier years she had been a poacher, and a most successful one too, but now she confined her abilities to the carrying away of any firewood she could lay her hands upon. Imprisonment produced no effect upon this old dame, nor did remonstrance either, for even if she was caught in the act, and let off, she would return as soon as the owner of the property had disappeared, quite oblivious of her promise, extorted a few minutes before, not to repeat her depredations. These were of so daring a character, and so often repeated, that the farmers were accustomed, when they had lost anything, to go and search this old woman's outhouse for the missing article. I never found such an indefatigable old woman: if she ever set her mind on any particular stake, she would be sure to persevere in her efforts until she obtained it, however firmly it might be planted in the ground or otherwise fastened.

Her younger sister, upwards of eighty years of age, lived with her; I am grieved to add that neither of them possessed any mark of religion, and I am equally sorry to add that I never succeeded in impressing any. The younger sister always stopped me when she saw me about to make some observation upon what I had read to them, by this constantly-repeated observation—"How nicely you read, do have a pinch of snuff!"

As soon as I was about to recommence after this mutual snuff-taking business was accomplished, "Do have another!" stopped me effectually. I persevered a long time, but perhaps not so long as her sister did at her sticks, and consequently I failed.

This snuff-taking old dame was very superstitious. She used to tell me that she frequently heard the "pixies" or fairies dancing on the moor; indeed, pixy-worship seems really carried on still in Devonshire. I myself have seen bullocks' hearts hung up in the chimney in order to keep away the evil influence of the fairies. Concerning another superstition, I remember asking a poor woman who was attending to her sick child, as it was suffering severely from measles. "Oh," she replied, "It will soon be all right, for I have had it 'crossed.'"

Upon further inquiry, I found that it was the common belief among the lower orders, that a seventh

son or daughter in succession, was possessed of certain miraculous powers; that if he, or she (for it was quite immaterial of what sex the operator was, so that it was the seventh in direct succession), laid a certain number of knives crossways on various portions of the patient's body, the person would certainly recover; this had been done in the case of the child in question, and I am obliged, in common fairness, to add that the child recovered, thereby confirming the mother's belief in the efficacy of the remedy.

One day, as I was walking up the village—and this short story will illustrate another superstition of the hilly part of Devon—I met a woman, named Mary Gray, with her hair all disordered, and bleeding from scratches on her face, and followed by a small mob of people hooting and jeering. Upon inquiring the cause of this uproar, I found that Mary and her neighbour had had a quarrel, and that Mary, to spite the other woman, had run down her neighbour's garden and stared fixedly at the pigs in the sty. Now, it was a firmly-rooted local superstition, that if an enemy stares at any animal of yours, unless you can manage to draw blood from that enemy before a certain time, the animal which was stared at will sicken and die. Accordingly, Mary's neighbour, not liking to have her pigs stared at maliciously, ran down the garden and interrupted the charm by drawing her nails rapidly down Mary's face, in order, as she imagined, to save the lives of her pigs. Hence the cause of the uproar I witnessed.

Another superstition of the higher class came to light thus. On Christmas eve, we at the Vicarage were all alarmed and astonished by the firing of guns and the shoutings of men and women. On going out to ascertain the cause, I found that our nearest neighbouring farmer was holding high festival in his orchard. It seems that it was the custom on Christmas eve to form a procession of the friends and labourers of the farmer, who, after liberal potations of cider, carried a bowl of it, hot and spiced, and with a large slice of cake, to the orchard. Having beaten the bounds, the cake was placed on the largest and oldest apple-tree, and the cider being poured over it, the women shout, and the men fire off guns, in the fervent hope of thereby raising a large crop of apples the following year.

Finding such a vast amount of superstition existing among the parishioners, I tried at first to laugh them out of it, but in vain, for it was too deeply rooted. So I started a series of lectures, which in the end proved most successful; but at first, from their exceeding novelty—for the natives had never heard one delivered previously—they were scarcely understood. You may judge of my mortification and surprise, when about to deliver a lecture upon the Reformation in England, it was generally supposed that I was about to discuss the then forthcoming Reform Bill.

I established, with the consent of the vicar, adult classes for both men and women, the latter with the assistance of the vicar's wife, and of another lady about whom I have more to say presently. I held this class in the afternoon, and for the whole time that we conducted it the attendance was very fair; one piece of superstition came to light through it, of which I was not previously aware. One of the young women, most regular in her attendance at our afternoon class, and of cleaner exterior than many of them, was unfortunately subject to fits. She had been told by a so-called wise woman, that if she stood in the church porch the first Sunday afternoon of the full moon, and asked thirty young men as they entered the church to give her a penny a piece, and with these thirty pennies thus

obtained, was able to effect an exchange for a new half-crown, and with this latter coin had a silver ring made, which she was constantly to wear on her middle finger of the right hand, she would be perfectly free from fits. She never told us how much she gave to the wise woman for the information, but all this trouble the young woman most cheerfully undertook. But her industry was not duly rewarded, for her fits continued as badly as ever. The proposed remedy having failed, she was then advised to obtain possession of the church key, and to open the great west door, then to walk up the aisle and lay the key on the altar-table. This was to be done at midnight in the full moon. Now this ridiculous action was gravely recommended as a positive cure. The vicar was very particular about the custody of the key in question, and had not parted with it on any pretence whatever, ever since some of the ringers had surreptitiously obtained it and got tipsy in the belfry. We found subsequently that the clerk managed on this occasion to persuade the vicarage servants to get it from its accustomed place on the study mantelpiece.

About midnight, we were all awoken and alarmed by violent shrieks proceeding from the churchyard. Next morning we were informed that the young woman, accompanied by a large number of male and female friends, had herself unlocked and opened the great west door of the church, and had walked up the centre aisle towards the chancel, her friends meanwhile waiting, silent and awe-struck, in a body outside. It turned out that when she reached the altar rails her courage failed her, and screaming with fright, she rushed down the church and into the midst of her friends, falling down into a worse fit than she had ever experienced, which lasted several hours; and, indeed, from the evil effects of this fit she gradually sank into a state of imbecility.

When speaking to the vicar one day upon the superstitions of the parish, he told me he had noticed one particularly, namely, that if a person met him whom he had recently thought necessary to reprove, she immediately held down her right hand and opened the third and fourth fingers to their widest extent. This action turned out to be the remains of the ancient banning, and it was supposed that this opening of the fingers in the manner indicated, was a charm to do away with any evil that might be incurred by the reproof of the parson or priest.

One more instance of a different kind of superstition, and I must close this chapter. I could tell many more instances of Devonshire superstition, but they did not fall under my own observation, and they have already more than once been made public by careful and intelligent writers.

Among the young men who attended my male adult evening class, was one whom I had given credit for superior intelligence, perhaps from the fact that he was a farmer's son, and in partnership with his father. His bright looks and active habits also most favourably impressed me, yet I was much annoyed to find that the universal thralldom of superstition bound him as firmly as it did the members of the labouring class.

The farmer, his father, was suddenly taken ill and died. This took place a few weeks after I left the parish, but the vicar wrote to me and told me the whole of the circumstances of the case, and I know that I can rely upon the truth of the statement. Now about the same time as this farmer died, a cow on the farm premises was also taken ill and died; these two events happening at the same time, struck the son as

something unusual and ominous; accordingly, he thought it as well to consult a "white wizard" who lived at T— concerning the coincidence. The wizard, wishing to make as good a market as possible out of the young man, told him that it was quite clear that this sad affair was no accident, but that he imagined an enemy had drawn a mystic circle in the farm, and that whosoever trod within that circle would surely die; but, added the cunning wizard, the circle was not meant for your father, that I feel certain of; I think it must have been meant for yourself.

My readers may easily picture to themselves the consternation with which this credulous young farmer would receive such a dreadful piece of news, nor will they be surprised when I tell them that he eagerly promised the T— wizard a large sum of money if he would charm away the threatened mischief. This the man with seeming reluctance consented to do, for a consideration, but he added that his injunctions must be most carefully carried out. They were as follows:—The young farmer was to collect as many of his friends together as possible; they were to assemble in the best parlour, at a certain hour; they were to be all dressed in black, with not a speck of white appearing in sight—not even a shirt-collar was to be worn; the room was to be lighted only with a peculiar coloured candle, procured solely from himself; each guest was to hold it lighted in his right hand, and in the other a large nail, also to be procured from himself. I ought to say that for these articles he asked a long price, and obtained his price, too, without its fairness being questioned, for the young farmer was in such terror that he would have consented to any terms in order that the charm should be made perfect. The ceremony was duly performed and pronounced successful by the operator, but of course he did not unfold the manner by which he had been enabled to obtain this success; the outward sign was in the bending of a nail in a particular direction and certain mystic words appearing on the walls drawn with phosphorus. At the conclusion of the rites practised, when each was ordered to extinguish the candle he held burning, the curtains which darkened the room were withdrawn, and the wizard proclaimed with a loud voice that the young farmer was now enabled to walk about his farm free from danger wherever he listed.

As I said a page or two back, I only mention these things as coming in contact with them in my first curacy. Of course others who have resided years in a similar locality must have observed many more and grosser instances of superstition; but how awful it seems to the mind of any reflecting man, that such absurd ceremonies should still be carried on and believed in, in this enlightened age! It makes one blush that such practices as I have mentioned should be performed in a country boasting of its superiority among the nations of the earth, and professing more genuine Christianity than the other countries of Europe. We can only hope that, by more frequent intercourse with the neighbouring towns, and by the progress of education, in spite of the farmers' hostility, these things will cease to be recorded as facts. Interesting they may be, and amusing also, to look back upon as the superstitions of our ancestors; but to know that they are still held and practised is enough to make one believe that in many things we are not far removed from the heathen themselves, and that we of the clergy, with all our zeal and energies, are not yet able to root out such fanatical absurd belief as the existence of fairies, witches, and wizards.

Varieties.

DELITZSCH'S OPINION ON THE ARTICLE "WHAT IS THE TALMUD?"—A clever and learned Jew, named Emmanuel Deutsch, connected with the British Museum in London, has lately published an article in one of the most widely circulated and best written periodicals in England, the "Quarterly Review," in which he endeavours to make out that there is no such great difference between Judaism and Christianity as is commonly believed, inasmuch as the parables and proverbial expressions of the New Testament are almost all to be found in the Talmud, and therefore are not to be considered as the peculiar property of Christianity. The impression produced by this brilliantly written article was the deeper because it was apparently the work of a Christian: for as Judas, when he delivered up Jesus to his enemies, went up to him, saying, "Hail, Master," and kissed him, so the Jewish author of the article calls Jesus "Our Saviour"—he conceals himself behind a Christian mask. We point out a case where he has been throwing sand into the eyes of his English readers. The Talmud quotes (Kiddushin iv. 14) the saying of Rabbi Simeon, son of Eleazar, "Did you ever see a beast or bird work for their bread, yet they never want, even though they were made solely to serve me. But I was created to serve my Creator, and if those who were made my servants find food without being reduced to poverty, must I, who was made to be my Creator's servant, be only able to exist in poverty and need? Certainly, I only ruin my livelihood by a miserable conduct. On such an occasion who does not remember the words of Jesus:—Behold the birds of the air: they sow not, they reap not, neither do they gather into barns, yet your heavenly Father feedeth them. Are ye not much better than they?" Mr. Deutsch draws many like parallels, all the while deceiving himself and others because he leaves out the dates of these sayings. For when did this Simeon, son of Eleazar, live? In the reign of the Emperor Hadrian (Seder-Ha-Doroth 73 A), a full century at least after Christ. We would not on this account decide that he simply borrowed the expression from Matthew's Gospel which contained these words in the Hebrew—or had heard them from Christian discourse—but the expression being similar, it is here as in most other cases that the original was given by Jesus, and Simeon's was but the copy. We say, in most other cases, we might almost say all, for except Hillel, of whom I have spoken elsewhere, all the teachers in the Talmud whose sayings correspond with New Testament doctrine, lived in much more recent times than Christ and the great founders of Christianity. For the rest we readily acknowledge that the whole of Christianity may be gleaned from the Talmud, if it consist of no more than such moral teaching as exhortations to trust in God and be just in our dealings with man. But this would be a miserably diluted exposition of it to collect only such universal notions. What need was there of the heavenly wisdom taking the form of man if he only tells us commonplaces?—*Professor Delitzsch, of Erlangen.*

BEE BATTLES.—A Yorkshire farmer writes:—"Having long been a keeper of bees, I read the articles in your periodical with interest, especially the accounts of 'Bee Battles.' The theory as to the cause of these battles may or may not be correct, but my object is to mention a remedy which many years ago came to my knowledge. A neighbour had more than sixty hives standing in one paddock. Greatly to his surprise, he one day observed that there was a general war raging amongst them, which they continued from day to day so resolutely, that it became clear most of the bees would be destroyed. A garden engine was procured and vigorously worked amongst them, when they were soon driven to seek the shelter of their hives. They required watching for a day or two, and the engine was applied as soon as any disturbance arose, but they shortly settled down to their old habits, and there was no more trouble with them. If this is tried, those who work the engine as well as those who supply the water, must be well protected, as the bees are greatly irritated."

FLINT JACK.—This notorious manufacturer of flint arrows, stone celts, and other spurious relics, has again been plying a busy trade, and his lucrative art has now numerous followers, by whom the market is flooded with forged antiquities.

BRITISH MUSEUM.—The Parliamentary grant this year is £99,380, being an increase of nearly £4,000. Among the special charges is £1,000 for the agent attached to the Abyssinian expedition.

THE PICNIC.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER X.

OUR anxiety to ascertain the fate of those on board the ship which the *Mignonne* had brought in as a prize, induced me, with my brother and William Trundle, to make another expedition to the French settlement. We ventured much nearer during daylight than we had done the first time, as we were certain that the people would be watching the arrival of the privateer and her prize. We were able, indeed, to reach a spot overlooking the harbour, where, among some thick bushes,

we concealed ourselves before the ships came to an anchor. William had brought his telescope, and we could almost see the countenances of the people on the decks of the ships. The large one was, we saw at once, an Indianman outward bound. We knew that by the number of young men and the young ladies on board, and their clear ruddy complexions. Had she been homeward bound, there would be old yellow-faced generals and judges, black nurses, sickly ladies and little children.

We anxiously watched the proceedings of those on board. The passengers were walking up and down in

a very disconsolate mood; the crew were clustered forward. By their looks and gestures as they cast their eyes towards the privateer, we thought that even then they were about to attack the Frenchman, and attempt to regain their liberty.

"I hope they will. I should like to help them," exclaimed William and Trundle, starting up simultaneously.

I drew them back. "Nonsense! we could not help them, and they will not make the attempt," I said. "See, the Frenchmen are going on board armed. They know what they are about."

Two large boats with armed men were pulling from the privateer to the Indiaman to strengthen her prize crew, while Captain La Roche was going on board her in his gig. He was soon up her side, and began bowing and scraping away most politely to the passengers, especially to the ladies. We could almost fancy that we heard him apologising to them for the inconvenience and disappointment he was causing them, with a spice of mockery in his tone, suggesting that it was the fortune of war, and that another day their turn might come uppermost. The crew of the Indiaman were then sent down the side, and rowed off to one of the hulks, while the passengers were conveyed to another.

"Then those hulks are prison ships after all," observed William, when the operation was concluded. "We may get on board them and let out the prisoners some day."

In this I partly agreed with him, though I could not help seeing the difficulties in the way. Even this hope was likely to be frustrated, for as we watched the Frenchmen who came on shore, we saw that they were joined by several men whom we had little difficulty in recognising as the crew of the wrecked ship, the very people who had lately deserted us. The mate was with them, but we did not see the captain. Perhaps, drunkard as he was, he was ashamed to go over to the enemy. All the party now entered a drinking-house together, being evidently on the most friendly terms.

We had therefore no longer any doubt that our existence would be made known to the privateer's men, and that the difficulty of surprising them would consequently be much greater than we had calculated on. We found that it was time to retrace our steps, all we had gained from our expedition being the knowledge that many of our countrymen and countrywomen were in even a worse condition than we were. Our report when we got back to the tents put our companions very much out of spirits. What were we to do? was the question. Some proposed that we should go at once and deliver ourselves up to the French, petitioning for their clemency. O'Carroll strongly opposed this.

"We are at liberty now, boys: if we once get into the hands of these French they will be our masters, and make us do what they like," he observed, and his influence, supported as he was by us, carried the point.

We wondered that Jacotot did not betake himself to his countrymen; but he laughed and said that he was now an English subject, that he should then be only one among many, that he was with us not only the principal cook, but the only man worthy to be called a cook; indeed, that he was perfectly content to continue to share our fortunes.

As several days passed and we received no visit from the Frenchmen, we began to hope that the seamen had not betrayed us. So far that was satisfactory; but had they remained faithful, I think that there is little

doubt that we should have attempted the rescue of the prisoners. At last, once more we saw the Mignonne put to sea; and immediately on this with O'Carroll and Sam Kelson in company, after watching for some time we could see nothing of the English sailors, we therefore conjectured that either they had quarrelled with the French and been put in prison, or had gone on board the privateer—too probably the latter. After a consultation, we agreed that we would, at all events, pay a visit to the passengers of the Indiaman. The French could scarcely think it necessary to keep guards constantly watching them, and we might therefore easily accomplish the undertaking. We accordingly set off to move round the harbour, intending to conceal ourselves in some spot near the Indiaman, that we might watch our opportunity for getting on board. We had gone on for some distance, and were approaching the spot, concealing ourselves carefully as we advanced, when sounds of laughter reached our ears—honest English laughter. We stole on, very much inclined to join in it, considering that we had not had a good laugh for some time, when from some rocks up which we climbed we saw below us a large party of ladies and gentlemen engaged in discussing a dinner in picnic fashion on the grass. They all seemed remarkably merry and happy. The younger gentlemen were running about helping the ladies, and doing the polite in the most approved fashion. They appeared to be drinking claret, and then they produced from a hamper in the shade just below us some bottles of champagne. There was no doubt about that, for we heard the loud pops as the corks were drawn, and saw the wine fizzing and foaming in the glasses. Trundle smacked his lips so loudly at the sight that some of the party turned a hasty glance in the direction where we lay hidden, supposing probably that the noise was made by some bird in the foliage above their heads. In a short time one of the young gentlemen was called on for a song. He without hesitation complied. I forget the strain. It was a right merry one. Another followed him, and then another.

"I say, Braithwaite, the bottles will be empty, and we shall not get a drop if we sit up here like owls in a bush," whispered Toby Trundle. "Just let me go down and introduce myself, and then you know I can introduce you all, and I'm sure that they will be glad to make your acquaintance."

I was inclined to agree with Toby, and so was William, not the less so that there were several very attractive-looking young ladies of the party; at all events, there seemed to be many reasons why we should make ourselves known. I nodded therefore to Toby, and in an instant he slid down the rock, and was in the midst of the very party before any one observed where he had come from. Their looks of astonishment at finding an English midshipman among them were amusing.

"Why, where have you dropped from, youngster?" exclaimed a civilian, a judge returning from—what was more unusual in those days than at present—a visit to England. "The clouds?"

"Not exactly; 'tis but from up there where I have a number of friends who would be glad to make your acquaintance," answered Toby, promptly. "May I introduce them?"

"By all means, very happy to see them," answered the nabob, as all civil servants of the Company were called in those days if they were well up the tree, and had made money. "Bring them down at once."

"I have not a gun, sir, or I might do it; but I'll hail

them, which will answer the purpose," answered Master Toby, with a twinkle in his eye.

We scarcely waited for his call, but tumbling down one after the other, we stood before the assembled company, to whom Toby, looking as grave as a judge, introduced us formally by name, finishing off with "Sam Kelson, boatswain's mate of his Britannic Majesty's frigate *Phoebe*."

"The very ship we spoke the day before we were captured," observed our friend the judge. "She was on the look-out for Captain La Roche and his merry men, and if she falls in with them, they will have a hard matter to escape; but sit down, gentlemen, we are very glad to make your acquaintance. We are companions in misfortune, though in some respects you have the advantage over us, by being at liberty."

We found that the passengers were allowed to live as before on board the Indiaman, and were under no sort of restraint, they having given their word not to attempt to escape from the island while the French had possession of it. We were treated in the most friendly manner by all the party, and were soon hob-nobbing our glasses of champagne with all the gentlemen round, Sam Kelson finding a companion in a corporal, the servant of a military officer going out to rejoin his regiment. Trundle soon let out to our new friends the intention we had entertained of trying to release them. They thanked us, but said that the attempt would have been useless, as the mouth of the harbour was strongly guarded. There were a good many other people on board the ships, while the officers and seamen remained strictly guarded, and were not allowed to visit the shore, except when the *Mignonne* or some other privateer ship of war was in the harbour. Their only fear was that they should run short of provisions before they were released, or that at all events they should have to live on very coarse and scanty food. They advised us to keep out of the Frenchmen's sight, lest we should be pounced on and treated as seamen and belligerents; this we very readily promised to do. Altogether we had a very pleasant and merry meeting, and were sorry when our friends told us that the hour for their return on board had arrived. It was arranged that they should have another picnic party in the same spot in three days, and they kindly invited us to join them. On our way back we had, as may be supposed, plenty of subjects for conversation. Both William and Trundle were greatly taken up with two of the young ladies they had met. What a hard fate was theirs, to be thus cut off from all intercourse with the rest of the world! "It is very well now, but in a short time provisions will run short, and they will get tired of their companions, only old nabobs, or married men, or stupid young griffins who know nothing of the world, but think a great deal of themselves, and they will have read all their books, and they will have no one to write to, and they will have done all their work, and their clothes will have worn out, and——"

"Not much chance of that, if their wardrobes are as liberally furnished as my sister Susan's was, for it would have lasted for a dozen years at least," observed Trundle, for it was William who had before spoken.

"But think of the change of fashions," he remarked, with assumed gravity. "What a dreadful thing for a young lady just out of her teens to know that all the rest of the world is dressing in a style of costume totally different from what she is compelled to wear."

"To be sure, I did not think of that," said Toby. "It makes it doubly incumbent on us to try and rescue them. That Miss Mary Mason is a sweetly

pretty girl. I would go through fire and water to serve her."

"And Julia Arundel is one of the most lively animated girls I have met for a long time," remarked William, with a sigh. I had observed O'Carroll in conversation with a lady who seemed to be a former acquaintance. He told me that he had known her in her younger and happier days, that she had married an officer in India, had come home with three children who had all died, and that she was now on her way to rejoin her husband.

"Her case is a very hard one," he remarked.

"So I suspect we shall find are the cases of many," I answered. "Sad indeed are the effects of war. The non-combatants suffer more even than the combatants. That is to say, a far greater number of people suffer who have nothing to do with the fighting, than those who actually carry on the murderous work. Oh, when will war cease throughout the world?"

"Not until the depraved heart of man is changed, and Satan himself is chained, unable further to hurt the human race," answered O'Carroll. "What has always struck me, besides the wickedness of war, is its utter folly. Who ever heard of a war in which both sides did not come off losers? The gain in a war can never make amends for the losses, the men slain, the physical suffering, the grief: the victorious side feel that only in a less degree than the losers."

I cordially agreed with him. Yet how many hundreds were daily falling at that time in warfare, how many thousands and tens of thousands were yet to fall, to gratify the insane ambition of a single man, permitted to be the fearful scourge that he was to the human race? We said as little about our expedition as we could, for the emigrants, as soon as they heard of so many of their countrymen being in the neighbourhood, were eager to set out to see them. We, however, persuaded them to remain where they were, for a visit of so large a party would not fail to be discovered by the French, and greatly increase the annoyances of our position. We, however, paid our second visit to the passengers of the Indiaman, and found them on shore at the place where we had first met them. Their spirits, however, had already begun to flag; their guards had been less courteous than at first, sickness had attacked two or three, gloomy apprehensions were troubling the minds of many. Still we had a pleasant dinner, and the song and the jest went round as before. The two midshipmen were the merriest of the party, and paid, as may be supposed, the most devoted attention to the two young ladies whom they thought fit to admire. Their happiness was, however, disagreeably interrupted by the appearance in our midst of half-a-dozen armed Frenchmen. They nodded familiarly at us. "Bien, messieurs; you have saved us the trouble of going to fetch you," said one of them, in a sarcastic tone. "You will not leave this, but as you are seamen, you will accompany us to the prison ship."

We soon found that they had been made acquainted by the seamen of the *Kangaroo* of our being on the island, and had only waited for leisure to go and bring us to the settlement. Another party had already been despatched to bring in the emigrants, and from the rough unmannerly way in which these treated our new friends, we could not but feel the gravest apprehensions as to the indignities to which they might be subjected. Our own existence in the hands of lawless ruffians would be very different from what it had hitherto been. The appearance of these unwelcome visitors completely broke up the picnic party, and while our friends returned to

their ship, we were marched off towards one of the hulks. We soon had evidence of the bad disposition of our captors towards us, for Toby Trundle, who was very indignant at being thus caught, beginning to saunter along as if he had no intention of hurrying himself to please them, one of them threatened to give him a prog with his bayonet. As we were walking along as slowly as Trundle could contrive to go, the sound of a shot reached our ears. It came from the sea. Our guards started and talked rapidly to each other. Several other shots followed in succession, some close together.

"There are two at it, of that I am sure," exclaimed O'Carroll.

The Frenchmen continued their gesticulations with increased animation. They were evidently eager to get to the mouth of the harbour, whence they could look seaward.

"They think that there is something in the wind, depend on that," observed Trundle.

Presently the firing became more and more rapid, seeming to our ears to come nearer and nearer. The Frenchmen could no longer restrain their eagerness to learn the cause of the firing, and totally disregarding, probably indeed forgetting us, off they set running towards the shore as fast as their legs could carry them. We waited for a few minutes to let them have a fair start, and then followed in their wake for some distance, turning off, however, after a time, to the right, so that, should they come back to look for us, we might not so easily be found. We in a short time reached a high rocky mound, whence we got a view of the sea spread out before us. Within a mile and a half of the land were two ships, both with topgallant sails set, standing in close-hauled towards the harbour. The wind was somewhat off the land, but yet if it continued steady, it was possible that they might fetch the harbour-mouth. Such, it appeared evident, was the object of the one, while to prevent her so doing was the aim of the other, which was the largest and nearest to us. As soon as the two midshipmen set eyes on the latter, they clapped their hands like children with delight, exclaiming at the top of their voices, "The Phœbe! the Phœbe! hurra! hurra!" O'Carroll took a more steady glance at the other ship, and then shouted, with no less delight, "And that's the Mignonne, and La Roche's day has come at last."

"I should hope so, indeed," cried Trundle; "depend on it, the Phœbe won't have done with him till he has made him eat a big dish of humble pie."

The frigate kept firing rapidly her foremost guns at the Frenchman, who replied to them in a spirited manner, with his aftermost ones, as they could be brought to bear. He was all the time luffing up, trying to eat into the wind as it were, but as that was scant, it gave the Phœbe, which was well to windward, a great advantage, and she was now rapidly coming up with him. As she did so, she every now and then luffed up for an instant, and let fly her whole broadside, doing considerable execution. We eagerly watched the effect of the shot. The Frenchman's sails were soon riddled, and several of his spars seemed to be wounded, many of his ropes, too, hanging in festoons. At last, directly after another broadside, down came his spanker gaff, shot away in the jaws, while the mizen topsail braces shared the same fate. In vain the crew ran aloft to repair the damage; the ship rapidly fell off, and all prospect of her fetching up to the harbour was lost, unless by a miracle the wind should suddenly shift round. The instant the sail came down, the midshipmen gave vent to their feelings of exultation in a loud "Hip, hip, hurra!" in which we could not help joining

them and the crew of the Phœbe, whom we could fancy at the moment doing the same thing.

"Don't be too sure that the Mignonne is taken, however," cried O'Carroll. "I never saw a faster craft, and see she is keeping away and going to try what her heels can do for her, dead before the wind."

The Mignonne, however, could not keep away without being raked by the Phœbe, whose shot, now delivered low, must have told with fearful effect along her decks. This done, the Phœbe instantly bore up in chase, and not having lost a spar, though her sails had several shot-holes through them, rapidly gained on her. The Frenchmen, to give themselves every chance of escape, were now busily employed in getting out studden-sail booms, in spite of the shot which went whizzing after them. In a marvellously short space of time a wide spread of canvas was exhibited on either side, showing that, though many of her men had fallen, she had a numerous and well-trained crew.

"They are smart fellows, indeed," I remarked. "Many of them fight with halters round their necks."

"That makes fellows smart in more senses than one," answered O'Carroll.

The Phœbe, of course, had to set her studden-sails, and away the two ships glided before the freshening breeze. We watched them with breathless interest. Their speed at first seemed so equal that the chase had still, it seemed, a chance of escaping.

Trust to our captain, he'll stick to her till he has made her strike, or he will chase her round the world," said the two midshipmen, in the same breath.

The Mignonne was firing away all the time with her stern chasers, while the frigate was replying in from those at her bows. They were both firing at each other's spars, the one hoping, by crippling her opponent, to escape, the other to prevent her doing so. What had become of our guards all this time we had not for a moment thought, while we hoped that they had equally forgotten us. The chase, indeed, probably absorbed their attention as it did ours. Few of us doubted that the English frigate would ultimately capture the Frenchman; but should she do so would she of necessity come back with her prize to our island, or would she sail away and, perhaps ignorant of our existence, leave us to our fate. One thing was evident, that we ought to guard ourselves against the insolence of the French garrison. The men were evidently the scum of society, and should they find themselves without restraint, it was impossible to say what atrocities they might not commit. Anxious as we were to know the result of the chase, we agreed, therefore, to go back to our friends to give them warning, and to consult with them what steps to adopt. Before leaving our look-out place we took one more anxious glance at the two ships. Both O'Carroll and the midshipmen declared that the Phœbe was positively overhauling the Mignonne, and that in a short time we should see the latter haul down her flag. I doubted it.

THE P. AND O. COMPANY.

THIRTY years have elapsed since the "Hindustan" was despatched by the company to open the line of communication between this country and the East. Previous to that, the traffic did not extend beyond the peninsula of Spain; and hence, on the extension of the line, the directors named the company "Peninsular and Oriental." It must not be supposed that this pioneer of the magni-

ficient line of steamers that now sail up the Mediterranean was at all to be compared with even the smallest of them in tonnage or horse-power. Steam navigation was at that period still in its infancy, and, twenty-five years previously, the whole United Kingdom possessed but one solitary steamboat, and that only of sixty-nine tons burden. Of the increase of this mighty power during the subsequent twenty-five years, the progress of the Peninsular and Oriental Company exhibits the most remarkable example on record. At the close of that period we find them in possession of fifty-three steamships, of an aggregate of 86,411 tons, fitted with steam machinery of 19,690 horse-power; nine steam-tugs of 864 tons and 275 horse-power; and 13,663 tons of sailing transports, store, and coal-ships, the value of which, with the other property of the company, amounted to £3,836,084; while the receipts for work performed by this fleet of steamers amounted to £2,136,076 during the year.

Here is a vast navy in itself: in fact, the P. and O. Company may rank as a great naval power. In ordinary times it is a power employed in the honourable and peaceful tasks of traffic and commerce, but also available for transport service in time of war.* They are ever adding to their fleet the finest ships which money and art can secure. The last we hear of is the *Magdala*, of 3,000 tons, with a sister ship, the *Hindustan*, and another of smaller tonnage. Losses occur sometimes, as that of the *Nippon* lately at Amoy, but the list is at once filled up, if possible, with finer ships. The tear and wear alone of such a fleet is written down at £150,000, and the company is its own underwriter.

If the company at the outset had depended upon their own resources and the ordinary patronage of the public, it is doubtful whether they would have made such rapid progress; but, in aid of their line, the Government granted them a subsidy to carry the mails for India, by way of the Isthmus of Suez and the Red Sea, when they had previously been conveyed by the tedious passage round the Cape of Good Hope, in sailing-ships. Of course the new route required a separate service of steam-vessels from Suez, where the company have a *dépôt* for provisioning and refitting that is unequalled anywhere, besides a large establishment at Aden, at the entrance of the Red Sea. At first the line was confined to Bombay, Ceylon, Madras, and Calcutta, after which it was extended to Singapore, Hong Kong, and other China ports, and from Point de Galle, in Ceylon, to Australia. Recently the route has been extended from Shanghai to Yokohama, in Japan, and a branch service leaves Suez for Seychelles and the Mauritius.

Including the Japan and local China service, each delivery in London of the mails by the company's steamers involves the employment of eight steamships, and a voyage of 19,867 miles by sea, besides a journey of 982 miles by land, making 20,849 miles for each trip. In the performance of one of these complete trips, mails, passengers, and cargo, are delivered and received at eighteen ports, and are transferred from ship to ship five times. A fine-weather voyage throughout is rarely if ever experienced. If the India and China seas are calm during the European winter, the vessels may be subjected to the most violent weather in the Bay of Biscay and the Mediterranean. If the Bay of Biscay

and Mediterranean are calm in the European summer, monsoons prevail in the Indian Ocean, and the dreaded typhoon sweeps the China and Japan seas; while at the same time it is winter in Australia, when the stormiest weather occurs during the year in the southern hemisphere.

The Peninsular and Oriental vessels never meet with icebergs, like those which traverse colder seas; but the circumstance which insures their freedom from this form of annoyance exposes them to another difficulty, which will be appreciated by those who understand something of the working of a steam-engine. Much of a steam-engine's efficiency depends upon the principle of condensation—condensation, of course, depends upon a constant supply of cold water. Now, the company's steamers in the East, during a great part of the year, navigate an ocean of warm water; the temperature of the sea being frequently over 90°, the working power of the machinery is consequently much impaired and decreased.

The punctuality with which these services are performed is most remarkable. The mail contract imposes a heavy penalty for not leaving a steamer ready to start to the day from the terminal and principal ports; but during the first twenty-five years of the company's contract, they never once incurred the penalty, although, since the commencement of the existing India and China contracts, their steamers have started, on those lines alone, upwards of four thousand times. The Postmaster-General, in one of his recent reports, mentioned the arrival of the combined mails from Sydney, New South Wales, a distance of 13,000 miles; from Calcutta, 8000; from Shanghai, 11,000; and from Hong Kong, upwards of 10,000 miles; these mails being due in London on 13th November, at midnight, they arrived *one hour and ten minutes before their time*. This is no unusual occurrence, for in the great majority of arrivals, eight and nine times out of twelve, the mails either arrive the day before, or the day on which they are due. When the telegram announces "The India, China, and Japan Mails" at Marseilles, the public must do justice to the extraordinary feat thus safely accomplished.* To bring all those mail-bags and boxes together, a score of seas have been traversed, from the Yellow Sea and North Pacific, through the Malacca Straits, down the Bay of Bengal, across the Southern Ocean, the Sunda Sea, the waters of Sindbad, up through Bab-el-Mandeb and the Red and Mediterranean seas, the company's keels have ploughed the billows to bring us the letters of business and friendship, of love and hate, of pleasure and sorrow, of satisfaction, disappointment, and perpetual progress.

During the first twenty-five years the company carried upwards of half a million of passengers; and not more than five or six lives have been lost by wreck or other casualty. Compared with other passenger lines to America and Australia, where the ships are thronged by the poorer class of emigrants at low passage rates, this number of passengers is not remarkable. But when we take into consideration the fact that the company convey none but first-class passengers at high rates, with steerage accommodation only for their servants, the number becomes important by reason of their position in society, and the large sum paid into the revenue of

* During the Abyssinian war the Peninsular and Oriental lent the Government six fine vessels for the Red Sea and Indian Ocean transport duties; it supplied in all about 150,000 tons of coal; and by the condenser in its ships it furnished the army with 500,000 gallons of distilled water.

* For one London Oriental mail delivery seven first-class ships of the P. and O. have to work in harmony. One has to come from Japan, a second from Hong Kong, a third from Sydney, a fourth from Calcutta and Madras—all timed nicely to meet at Point de Galle in Ceylon. Then the vessel from Point de Galle and that from Bombay join mails at Suez, and a seventh brings them from Alexandria to Marseilles.

the company. In former years the tariff of charges was £152 10s. to Calcutta, £180 to Shanghai, and £150 to Melbourne or Sydney; so that the annual average passage-money was not less than one and a quarter millions sterling, including passengers' fares for short distances along the line. When the French company started their opposition, about the year 1862, they reduced the rates of passage-money, to which the Peninsular and Oriental Company had to conform, charging £99 10s. to Calcutta, with proportionate reduction to other ports. From this date the monopoly of passenger traffic to the East was broken in upon, and the *Messageries Impériales* service carries now nearly as many passengers as the Peninsular and Oriental Company.

But the French company made another serious innovation on the stereotyped passenger system of their English rivals, in preparing separate and tolerably good accommodation for second and third-class passengers. This was a great boon to those who had not the means to travel first-class; who had either to mess with servants, or proceed by sailing-vessel round the Cape of Good Hope—where the voyage is as five months to two "Overland." The Peninsular and Oriental Company have not yet conformed to this arrangement of the rival line; but it would be a wise step on the part of the directors, while they are building a larger class of vessels to carry merchandise, if they fitted up second-class and third-class cabins in them. Passengers to the East are not now restricted to the Government officials and merchant princes, who can afford to pay high rates. There is an increasing migration of the comparatively poorer classes to India, China, and Japan, who have either gone to "push their fortune," or who have obtained situations, and to whom time is money. Consequently, while the fitting up of cheaper accommodation for passengers would meet the requirements of the increasing traffic, there would be room for both services all the year round. These remarks apply more particularly to the passenger traffic east of Suez, for the vessels from Southampton to Alexandria have tolerably good accommodation for second-class passengers.

On the other hand, it is said that the fare on board the French ships is not suited to an Englishman's palate; and therefore the voyage becomes uncomfortable, when John Bull does not get his roast beef and brown stout, which is amply served up on board the Peninsular and Oriental boats. We have travelled by both lines, and can testify to the abundance of fare in the vessels of each; and to our taste the meals on board the French boats were preferable, especially as it is principally during hot weather of a tropical character that the dishes are served up. At such a time few people can relish great joints of meat being laid on the table, and to some delicate stomachs the sight is more likely to take all appetite away. Some nice tasty dish is preferable, cooked in the French style, while a drink of claret and iced water is more refreshing than even "pale India ale." Indeed, we have often thought that the Peninsular and Oriental Company would do well not to bring the hot joints on the table at all, as they only serve to increase the temperature of the dining-saloon, when it is necessary to keep it cool by "punkas." *Apocryphos* of this: none of these steamers, French or English, have a proper system of ventilation to cool the interior. Surely there is ingenuity enough among the captains and engineers to fit up some kind of fanner to agitate the suffocating air, and set it going by the steam machinery. At present all the apparatus for this purpose is the old Indian punka, slung upon swivels, and pulled to and fro by manual labour. So intense

is the heat in sailing before the wind in the Red Sea, that the captains have now and then to veer the ship round to meet the breeze and ventilate the cabins.

It may be supposed that the consumption of provisions, and especially drinkables, is considerable on board these ships. In 1862 the consumption amounted to 14,602,514lbs. of what are termed general stores; 1,301,608 bottles of wine and spirits; 524,250 bottles of pale ale; 177,310 head of live stock; 160,130 poultry, and 13,015 sheep. The item of *ice* is of importance, and put down at 3,046,000lbs. Besides having imported ice on board the Mediterranean boats, the company have an ice-making machine at Suez, that supplies all the ships east of that port. They have also a large machine for distilling water there; but this is not required so much now, since the French cut the fresh-water canal from the Nile to that port, which supplies both the town and shipping. Altogether, the *depôt* of the company at Suez is upon a colossal scale. Besides the immense store of provisions and drinkables—larger than any single store in the docks of London or Liverpool—they have every description of marine stores, "from a needle to an anchor," piled up in the premises, for refitting the vessels. Then out of doors, in that rainless district, all the coals are piled up on the beach, for the supply of the steamers east of Suez. The company pay an average of more than half-a-million sterling every year for coals, and an average of 170 sailing-ships is engaged annually in conveying coals to their stations. The coals suffer greatly in transmission; and, notwithstanding all the expense incurred for their protection from the effects of climate, they undergo a depreciation of fully 20 per cent. from their original quality before they are burnt. In addition to that deterioration, the coals sometimes catch fire if laid down wet in the face of the hot sun; and a whole cargo will thus be consumed before the fire can be extinguished.

It will be seen from the foregoing, that if the company have a large revenue they have also a corresponding expenditure; and during the past five years since the statistics here given, the former has been diminishing, while the latter has been increasing. Without entering into details, the reader will glean from the following extract from the report read at the half-yearly meeting in June, 1867, the chief causes of the cessation of profits:—"The export of specie to the East, which has usually formed a considerable portion of the company's revenue, has, during the six months embraced in this report, almost entirely ceased. There has also been a great falling off in the revenue, owing to the contraction of mercantile operations in the East, which has followed the monetary panic of 1866, and the very active competition of the French company. To these disadvantages has been added a considerable rise in the cost of coal at the foreign *depôts*, involving an increased outlay, as compared with the corresponding six months of last year, of upwards of £40,000. It is scarcely necessary to state that the directors could exercise no control over these adverse circumstances, neither could they, by any modification or curtailment of the services, counteract the unfortunate results, as the strict conditions of the mail contract had to be fulfilled. Without, therefore, entering into detailed statements and figures, the directors regret to report that the state of the accounts to 31st March, exhibits an excess of expenditure over receipts to the extent of £36,000, without making any provision for insurance or depreciation."

These candid statements are creditable to the directors of the company, as they honestly show the state of their affairs; while, in other portions of the report, proof is

given of their solvent condition, and the prospects of increased revenue next year. That their anticipations will be realised is our hearty wish, as the collapse of such a company would be in itself a national calamity. Other associations, with monetary transactions of equal magnitude, might fail without bringing about one tithe of the effects that would accrue from such a disaster here. Including the splendid establishments in London and Southampton, no less than fourteen principal and subsidiary establishments have to be kept up, and there are employed altogether 8,250 persons afloat, and 4,351 on shore, making a total of 12,601. But this does not give the actual number of individuals dependent upon the expenditure of the company, which at a low estimate cannot be less than 40,000, and may be 50,000. And if we take into consideration those that are indirectly benefited by their monetary operations, we may double or treble these numbers. Viewing it in this light, the company is a great floating colony, administering affairs equal to some small continental state or dependency of the British Crown. But that which makes it of most importance to England, is being a practical school for seamanship, and the training of our youth in the art of navigation. The officers on board the Peninsular and Oriental Company's steam ships are gentlemen who will compare favourably with the officers of her Majesty's Navy in the details of their profession, especially as pilots for the difficult navigation of the eastern seas, which, as we have seen, they have done with an infinitesimal loss of life, and comparatively trifling loss of property. Under these circumstances it is to be hoped that the directors will continue manfully to face their difficulties, and restore the Peninsular and Oriental Steam Navigation Company to its former prosperity, and their vessels command that amount of public favour which will render their line preferable to that of any foreign company, in economical charges and good accommodation. We are glad to see that they have concluded a new contract with the Government for a longer period than before, and on more favourable terms. The contract is to be for twelve years. There is to be a yearly payment of £400,000, unless the fund accruing for dividend from all sources should, *from causes not within the company's control*, fall below the amount required to pay six per cent. on their capital, in which case the subsidy is to be increased by the amount of the deficiency. On the other hand, should the profits permit the declaration of a dividend of more than eight per cent., the company undertake to pay to the Post-office one-fourth of the excess. The tender provides for a weekly service between Southampton and Alexandria, between Marseilles and Alexandria, and between Bombay and Suez; and for a service every alternate week between Suez and Hong Kong, Hong Kong and Shanghai, Shanghai and Yokohama, Bombay and Galle, and Galle and Calcutta. The rate of speed is to be ten knots an hour on the lines to and from Alexandria, and nine and a-half knots on the lines eastward of Suez. The stipulation guaranteeing a certain dividend, although an important novelty in the case of the Peninsular and Oriental Company, is not without precedent, the contract with the Kingston and Holyhead line including a similar provision. In arranging this contract her Majesty's Government have, we are glad to see, taken a broad view of a matter which is not departmental, but national in importance. The public have no wish that the company should be a loser by the services rendered, and are quite satisfied that, so far as our intercourse with the East is concerned, our communications could not be in better hands.

SIR CHARLES WHEATSTONE.

THIRTY years have elapsed since the subject of this memoir established the first practical result of his many investigations connected with electro-telegraphy, by laying, on the London and Blackwall Railway, the first electro-magnetic telegraph. The wires employed were of copper, enclosed in an iron tube, each wire being separated from its neighbour by some non-conducting material. A submarine electric telegraph had also been, from the commencement of Mr. Wheatstone's experiments, a prominent object in his thoughts. The laying of the Atlantic Cable, in August, 1866, was signalised by honours awarded to those who took an executive share in that great event; while Wheatstone, "but for whose marvellous following in the track of his gifted predecessors, there could as yet have been no electric telegraph at all, was left out in the cold, without being named!" Mr. Wheatstone has since received the honour of knighthood, as commonly thought, in recognition of his share in this great work of national importance—the electric telegraph. This, however, is but a portion of the labours of a series of years devoted to scientific researches, which had been rewarded by medals and other distinctions from the leading academies of the Continent, ere they were fully recognised in the country which gave our philosopher birth.

Charles Wheatstone was born in 1802, in Gloucester, a city noted as the birthplace of divines and scholars. In early life he was engaged in the manufacture of musical instruments, which led him to study the laws of Sound. In 1833, he presented to the Royal Society a paper "On Acoustic Figures;" and in 1835 he read to the Royal Institution an account of the different attempts which had been made to invent a speaking machine; and exhibited a copy of a machine from Germany, which distinctly pronounced *mamma, papa, mother, father*, and other words.

Light and Electricity were the sciences which Wheatstone was next led to investigate; and in 1834 he communicated to the Royal Society his experiments to measure the velocity of electric currents, and the duration of the electric spark. In the former it appeared that the human eye is capable of perceiving phenomena of light whose duration is limited to the millionth part of a second; and by Wheatstone's apparatus the spark was ascertained not to exceed the twenty-five thousandth part of second: a cannon-ball, if illumined in its flight by a flash of lightning, would, in consequence of the momentary duration of the light, appear to be stationary; and even the wings of an insect, that move ten thousand times in a second, would seem at rest. In the year when these interesting results were obtained, Wheatstone received the appointment of Professor of Experimental Philosophy in King's College, London.

In 1838, Professor Wheatstone submitted to the British Association at Newcastle his Stereoscope, an instrument contrived by him for illustrating the phenomena of binocular vision, the principle of which is thus simplified. When we look at any round object, first with one eye, and then with the other, we discover that with the right eye we see most of the right-hand side of the object, and with the left eye most of the left-hand side. When these two images are combined, we see an object which we know to be round. This is effected by the Stereoscope, which consists of two mirrors placed each at an angle of 45 degrees, or of two semi-lenses turned with their curved sides towards each other. To view its phenomena two pictures are

obtained by the camera on photographic paper of any object in two positions, corresponding with the conditions of viewing it with the two eyes. By the mirrors on the lenses these dissimilar pictures are combined within the eye, and the vision of an actually solid object is produced from the pictures represented on a plane surface. Hence the name of the instrument, which signifies *solid I see* (Hunt's "Poetry of Science"). Thus, when once the availability of one great primitive agent is worked out, it is easy to foresee how extensively it will assist in unravelling other secrets in natural science. The simple principle of the Stereoscope might have been discovered a century ago, for the reasoning which led to it was independent of all the properties of light; but it could never have been illustrated, far less multiplied as it now is, without Photography; and if, in the order of things, the cheap popular toy which the Stereoscope now represents, was necessary for the use of man, the Photograph was first necessary for the service of the Stereoscope. Sir John Herschel characterised Wheatstone's discovery as one of the most curious and beautiful for its simplicity in the whole range of experimental optics. And, although a controversy arose between Wheatstone and the late Sir David Brewster, as to the theory of the stereoscope, Sir David admitted Professor Wheatstone to have the merit of being the first to exhibit practically the striking result, and added, "In prosecuting this subject, my attention has been particularly fixed upon the interesting paper of my distinguished friend Mr. Wheatstone. It is impossible to over-estimate the importance of this paper, or to admire too highly the value and beauty of the leading discovery which it describes."

In the spring of 1844, when the Museum of George III was deposited at King's College, his Royal Highness Prince Albert was present; and Professor Wheatstone, with one of his telegraphs, formed a communication between the College and the lofty shot-tower on the opposite bank of the Thames. The wire was laid along the parapets of the terrace of Somerset House and Waterloo Bridge, and thence to the top of the shot-tower, about 150 feet high, where a telegraph was placed; the wire then descended, and a plate of zinc attached to its extremity was plunged into the mud of the river, whilst a similar plate attached to the extremity at the north side was immersed in the water. The circuit was thus completed by the entire breadth of the Thames. Unfortunately, at the moment the experiment was to be noted, a barge came along, and broke the wire; but it was speedily restored, and the telegraph acted as well as if the circuit had been entirely metallic.

The leading data of the researches which preceded the invention of the electric telegraph may be recapitulated here. In 1819, Oersted made his grand discovery of the deflection, by a current of electricity, of a magnetic needle at right angles to such current, which discovery, Dr. Hamel, of St. Petersburg, states Baron Schilling was the first to apply to telegraphy. In 1835, Gauss and Weber established a system of electric communication between the Observatory at Gottingen and the University. In 1836, Professor Muncke, of Heidelberg, who had inspected Schilling's telegraphic apparatus, explained the same to Mr. William Fothergill Cooke, who, in the following year, returned to England, and subsequently, with Professor Wheatstone, introduced the telegraph upon the railway as already stated.* Meanwhile a misunderstanding had arisen relative to

the positions of Messrs. Cooke and Wheatstone, in connection with the invention; when Sir I. M. Brunel and Professor Daniell drew up a document stating that:—

"Whilst Mr. Cooke is entitled to stand alone, as the gentleman to whom this country is indebted for having practically introduced and carried out the electric telegraph as a useful undertaking, promising to be of national importance, Professor Wheatstone is acknowledged as the scientific man, whose profound and successful researches had already prepared the public to receive it as a project capable of practical application. It is to the united labours of two gentlemen so well qualified for mutual assistance, that we must attribute the rapid progress which this important invention has made during the five years since they have been associated."

This document is dated 27th April, 1841, and is acknowledged by Messrs. Wheatstone and Cooke to be correct; but it refers only to the first patent in which they were associated. Professor Daniell considers the document to make no assertion whatever as to the originality of the invention on either side, and adds, that he considers Professor Wheatstone's "undoubted inventions of incomparable beauty and simplicity, and by themselves sufficient to supply all the purposes of the most extended telegraphic communication;" and that Wheatstone's "contrivances would have been of no avail for telegraphic purposes without the investigations which he was the first to make of the laws of electric magnets when acted on through great lengths of wire."

The Abbé Moigno, who was in England in the spring of 1846, whilst Professor Wheatstone's experiments were in preparation, states, that in 1840, Mr. Quetelet had announced Mr. Wheatstone to have invented the means of transmitting signals between England and France, which he (the Abbé) had witnessed; thus attesting Wheatstone's claim to the Submarine Telegraph. Vice-Admiral Smyth, in 1850, attested Wheatstone as, "undoubtedly, the first contriver of the electric telegraph in the form which made it available for popular use;" adding, of "his submarine telegraph he showed me plans, and publicly explained the details upwards of eighteen years ago" (this was written in 1850). De la Rive, in his "Treatise on Electricity," 1858, wrote: "The philosopher who was the first to contribute by his labours, as ingenious as they were persevering, in giving to electric telegraphy the practical character that it now possesses, is, without any doubt, Mr. Wheatstone. This illustrious philosopher was led to this beautiful result by the researches that he had made in 1834 upon the velocity of electricity, researches in which he had employed insulated wires of several miles in length, and which had demonstrated to him the possibility of making voltaic and magneto-electric currents to pass through circuits of this length."

Four years previous to this date, a paper in the "Quarterly Review," ascribing the sole merit of the invention of the electric telegraph to Professor Wheatstone, provoked a rejoinder from Mr. Cooke, in a pamphlet, of which four editions have appeared. Two large octavo volumes of pamphlets and arbitration papers have also been published by Mr. Cooke; and in January, 1868, there appeared a volume of 164 pages by the Rev. Thomas Fothergill Cooke, in assertion of his brother Mr. Cooke's rights, the main points in which are the vindication of the Brunel award, and extracts from the arbitration evidence; the whole of which is so far a matter of detail, as to prevent our entering into the controversy.* Meanwhile, it is hoped that

* Lord Wrottesley, in 1858, stated that Wheatstone first tried his telegraph on the line of the London and Birmingham railway, in July, 1837.

* This volume, apart from the documentary quotations, contains a large amount of information upon the grand discovery and invention of the Electric Telegraph. Three pages recording the proceedings of the "Pioneer of Electric Telegraphy," prior to the great realization in 1836-7, are especially attractive.

the Government do not intend to overlook the claims of Mr. Cooke, as the introducer of the practical telegraph. The Society of Arts awarded their fourth gold medal to Mr. Cooke and Mr. Wheatstone; but the latter gentleman, cordially acknowledging Mr. Cooke's

gulation, the parts that form the meeting-points of three series of cables become the points at which these multitudinous wires have to be distributed at intervals.

Wheatstone's Universal Military Telegraph is accepted for field and rifle practice; it is worked by magnetic

C. Wheatstone

claim for "the practical introduction," did not even claim his duplicate medal.

Here we may mention the automatic instrument completed by Wheatstone in 1867, by which, properly manipulated, he can transmit 600 distinctly visible signs or letters in a minute. The system of wires, which we see stretching across the sky-line of the great thoroughfares of the metropolis, has been appropriately termed "the nerves of London," and is Wheatstone's latest scheme, in which, by a simplified apparatus, messages are sent along the lines at the rate of 100 letters a minute; the process of reading or renewing the message is, of course, proportionally rapid; and the new instruments for this purpose bear the same relation to the old ones, that the works of a watch bear to the stronger machinery of an eight-day clock. The cables are fine copper-wire, along which the battery (the magneto-electric machine of Faraday) transmits the electric impulse, produced from a very small magnet. The area of London being divided by a system of trian-

power, is only six inches square, and is always ready for immediate use. The communication in the field, or between the target and the gun, is maintained in the ordinary alphabetical language by the most simple means, so that any person who can read and spell is able to work it. This telegraph was used by the French in their Italian war, and is now in use in various public offices. Another of Wheatstone's latest discoveries is, that an electro-magnet, if it possess the slightest polarity, may become a powerful magnet by the gradually augmented currents originated by itself.

Sir Charles Wheatstone, D.C.L., LL.D., F.R.S., is a corresponding member of the Academies of Science of Paris, Brussels, Berlin, Munich, Stockholm, Turin, Milan, Rome, Washington, etc.; and is Chevalier of the Legion of Honour. Sir Charles has just been appointed a member of the Italian Scientific Society of "Forty," in the place of the late Professor Faraday. A gold medal has also been awarded to Sir Charles Wheatstone; and the President of the "Forty," in his letter, writes: "I

will not here pass in review the various memoirs in physics which you have published in the 'Philosophical Transactions,' since all carry the impression of the inventive genius which ever distinguishes all that you have done." The method of measuring the velocity of electricity and the duration of the spark are then mentioned; and next, the applications of the rotating mirror, so important and various in experimental physics; the invention of the stereoscope; the "rheostat;" and the "Wheatstone's Bridge," for the measurement of electric currents, of the resistance of circuits, and of electromotive forces. "To you," adds the President, "we principally owe the practical invention and the true realisation of the electric telegraph. All these great acquisitions, procured by you, to physical science, render you well worthy of this distinction from the Italian Society of Science. May you be preserved in health and activity; and your country and all your admirers and friends are certain to find in the discoveries still to be added while you continue to work, some compensation for that immense and irreparable loss which natural philosophy has sustained by the death of Faraday."

MY FIRST ENCOUNTER WITH A TIGER.

WHEN I first came to India, now many years ago, I was posted to a district in which there were many hills, much jungle, and very good shooting. By good shooting, I mean of large game, such as tiger, bear, cheetah, sambre (the elk), and so forth. There is abundance of other descriptions of shooting in nearly every part of India, such as antelope, bustard, wild duck, grouse, jungle-cock, and snipe; but all such sport is tame and uninteresting compared with the excitement of the pursuit of the larger kinds of game. My duty obliged me to be constantly moving from place to place, and whenever I was in the neighbourhood of jungle (or forest), and could spare the time, I always devoted a day to shooting. It was early in the year 1857, just prior to the commencement of the great mutiny, that I had pitched my camp in a beautiful little valley, well watered, and surrounded on three sides by hills. On the east, nearly opposite to my tent, the hills were about one thousand feet high, and near their summits densely wooded with small forest trees, from the depths of which in the early morning could be heard the sonorous trumpeting of sambre. To the north, the hills were lower, and not so thickly wooded; but they were split up into deep ravines, in which the black bear and the wild pig were to be found. To the west, and behind my camp, the hills were comparatively bare, showing near their summits bluff inaccessible cliffs, two or three hundred feet sheer precipice, in the crevices of which were numerous and large combs of wild honey.

Previous to retiring for the night, I had been contemplating the prospect of a day's shooting, and the red dy (head man) of the village, who was a keen old shikaree (or hunter) had been going over with me the pros and cons of the possibility of my meeting with a cheetah. Bears and sambre we were sure of; but, although I had frequently seen cheetahs in my rambles, I had never been able to get a shot at one, and now that I was near a well-known haunt of cheetahs, I did not wish to lose the opportunity afforded me. The cheetah, or leopard, is a very handsome but very cowardly beast; attacks and carries off sheep, goats, and dogs, but has seldom been known to attack a man, except when severely wounded and brought to bay.

The skin is a rich light brown, covered with irregular

nearly circular spots, which near the belly are dark brown, but become almost black as they approach the back. The animal is about three feet high, and from five to six feet in length; has a very vicious cat-like face, and is usually seen creeping through the jungle with its belly almost touching the ground. I have, however, once seen a cheetah at full gallop, tail extended, head up, and a young kid in its mouth. The red dy and I parted without coming to any conclusion, except that some difficulty would be experienced in collecting the necessary number of beaters, and I shortly afterwards retired for the night.

I think it must have been one or two o'clock in the morning, when I was awakened by one of the most unearthly howls I ever heard; so prolonged, so dismal, yet so horrible was the sound, that I sat up on the cot feeling quite scared. I listened, but not a sound broke the stillness of the night, and I began to think that the howl was but the effect of imagination; that, in fact, I had been dreaming, when again, and this time apparently close to me, the same terrible yell broke forth, and echoed through the valley. I sprang out of bed and rushed to the door of the tent, and there, not ten paces from me, was a cheetah, evidently preparing for a third howl. The beast was really calling its mate. Startled, I suppose, by my sudden appearance, the beast made off into the adjacent forest; but I was now resolved to devote the following, or rather the present, day to the pursuit of this animal, and, if possible, become more intimately acquainted with my unpleasant visitor. The red dy was sent for, and no sooner did he and his people hear that a cheetah had been down from the hills than all difficulties about beaters and shikarees vanished. The red dy himself was too ill and weakened, from a late attack of fever, to accompany me; but by four o'clock he had collected seven shikarees, each with his long matchlock loaded and primed, matches alight, and powder horn slung in front, and about fifty beaters. About five a.m. we started; the shikarees in front as guides, and the beaters bringing up the rear. For the first half mile or so a continual chatter was kept up, but as we entered the jungle, the whole party broke into single file, and conversation quite ceased. So we plodded on, occasionally starting a spotted deer, a peacock, etc., until about eight a.m., when we stopped to rest under the shade of a wild mango tree, and by the side of a little hill stream. About nine a.m. we reached the appointed place, and after a long consultation, in which every one joined, it was decided that I, with six shikarees, should remain under a tree, while one shikaree and all the beaters were to form a half-circle and drive out our friend the cheetah, who had been tracked down to this neighbourhood. Waiting is weary work, and it will therefore suffice to say that after several ineffectual beats we all met again, disappointed and somewhat dispirited, at about two p.m. Breakfast was the first thing to think of, and, accordingly, while my servant prepared something for me, each native commenced upon his own store of rice, which he had no sooner swallowed than he laid himself down and went to sleep—a common practice with the natives of India. About three p.m. we started again, and I promised that if we could meet with no fresh tracks we would get back to camp.

We had proceeded about one hundred paces, when from thick bamboo jungle we suddenly emerged into a little open glade, and there met a woodcutter, who in a great state of excitement informed us that a female cheetah and an "immense number" of cubs had just passed that way. Sure enough we found in the sandy

soil the tracks (which at the time I thought very large) of a cheetah and two cubs. A female cheetah with cubs is often a very dangerous beast to meddle with, and I was for allowing her to pass away quietly, but I was overruled by the shikarees.

I was young in the country in those days, and prone to rely too much upon what a native said of himself and of his courage, and I now credited what the shikarees said of their devotion to me, and of their former exploits in cheetah and tiger hunting. The beaters, under the charge of one of the shikarees, were told off about six paces from each other, thus forming a line of three or four hundred yards in length, and then after a short walk I was posted under a tree on the top of a small rising ground, but in the midst of dense bamboo jungle, so dense that I could not see more than twenty or thirty paces distant. I had a double-barrelled gun loaded with ball, and six shikarees stood behind me, so that I could with confidence rely upon having eight bullets to throw at the cheetah.

Presently, far away in the valley, we heard the first shouts of the beaters. They approached nearer, their shouts became more distinct, when suddenly, and apparently from the very midst of the beaters, we heard a most unmistakable and ominous roar—a roar that sounded to me strangely unlike any noise I had ever heard from a cheetah. The shouts of the beaters stopped at once, and I guessed that the cheetah had been roused and driven from its lair. I turned for a moment to warn the shikarees to be ready, when to my dismay I saw that all had clambered up the tree and left their matchlocks piled at the foot. For a moment I thought of following their example, but, while I yet hesitated, a rustling was heard, the bamboos shook, bent and parted, and out trotted—not the angry cheetah I had been expecting, but a magnificent tigress. I see the beast now as she came into the open space with a long quick stride, head down, and belly almost touching the ground, and then, as she caught sight of me, stop suddenly and fix her savage bright eyes on me; not a movement in her except a gentle but most ominous motion of the tail. I was so utterly astonished, so totally unprepared for meeting a tigress, that I stood apparently paralysed, my gun at the ready and my eyes almost starting out of my head. I stirred neither hand nor foot; I do not think that my eyelids even moved, for I was too startled, ay, and too much afraid to make even the slightest movement; for I knew well that had my hand trembled, had a branch of the tree overhead snapped, no earthly power could have saved me. I was conscious at the time that my unnatural quietude was due not to presence of mind so much as to an involuntary feeling that not a muscle, not a hair must so much as quiver; and yet, with all that, I remember how much I admired and envied the perfect stillness and repose of the brute before me, and how I became possessed of an insane desire to shout, or to do something to make the beast move. I know that my pulse was not quickened; but the beating of my heart seemed to me to be so unnaturally loud, that in the moment of greatest peril I feared the beast would hear it. All kinds of thoughts passed with marvellous rapidity through my brain, but one thing I remember well, and that is, I felt positively grateful to the cowardly villains in the tree above me for being so quiet. I do not suppose the tigress and I stood thus face to face for more than a minute; but it seemed an hour, and a very long one, to me, before she slowly walked off, keeping her eyes steadfastly fixed upon me until the intervening jungle hid us from each other. Then the reaction came—my gun seemed made

of lead and dropped out of my trembling hands, my pulse rose rapidly, and I broke out into such profuse perspiration that I felt as if I had been plunged into a bath. I soon recovered myself and remembered that I had escaped from a great and imminent danger, and I hope I did not forget that true thanksgivings for such an escape were due. A tigress is a fine-looking animal behind the bars of a cage in the Zoological Gardens, but she is a very different beast in her native forests, particularly when she has been partially deafened and wholly enraged by a gang of two-legged enemies, and when she suddenly comes upon one of those enemies all alone and apparently determined to intercept her. Had a finger moved while she thus stood glaring at me, she would have been upon me in a single bound, and before I could have raised my gun to my shoulder; and one stroke of her paw, or one grip of her formidable teeth, would have finished the story of my life. I can only suppose that the reason why she went off so quietly, was partly because I was so unnaturally still, and partly because her cubs must have been in the neighbourhood.

I had been wondering at the mutual silence of the beaters, who after the roar of the tigress appeared to have been struck dumb. I was on the point of despatching one of the boasting cowards of shikarees (who by-the-by had descended from the tree now that all danger was past) to call in the beaters, when the whole gang came in. It appeared that as one of the beaters was passing a rock and yelling like a maniac, the tigress sprang upon him from behind, clawed his back from shoulder to heel, and then, with a roar, made off into the jungle. The beaters were so terrified at this mishap, and at the unexpected sight of a tigress, that, lifting their wounded comrade, they made off as silently and rapidly as possible. I washed the poor fellow's wounds with gunpowder and water, and then sent him in to the nearest station (forty miles distant) for medical treatment. He recovered from his wounds and returned to his village, but his system had received a shock from which it never recovered, for a month afterwards he died, and literally of "tiger fear." So ended my first adventure with a tiger, and I can only say that I have never since relied upon a native shikaree in moments of danger.

THE SATURDAY HALF-HOLIDAY.

WHEN a working-man has been toiling with the regularity of a machine for weeks or months together from Monday morning till Saturday night—rising early in order to keep time at the counter, in the warehouse, or in the workshop, and often retiring late because compelled to work late—it is small wonder if he grows weary and spirit-broken and discontented with his lot. Well-meaning people are apt to call him reckless and vicious because when he does escape from his long labours he turns for refreshment and recreation to the public-house. They do not reflect that in many cases others are more to blame than the late labourer—that very often his week's wages are paid to him in the public-house, and he has to wait there on the Saturday night until he gets them; that not seldom his wife comes to wait there too for the money which is wanted for the late market where the Sunday's dinner must be bought. This system of late Saturday-night's pay is too common even now, and it is a source of degradation as well as of heart-burning to thousands; but twenty years ago it was, among an extensive class of employers in London, the rule rather than the exception. The motives that led to such a

system were sufficiently manifest to any one who sought for them. In those days Sunday work was far more common than, happily, it is now, and in busy times, during the height of the London season, men rarely knew, before their wages were paid on the Saturday night, whether they would be wanted to work on the Sunday or not. The employers themselves often did not know what work might come in of an urgent kind to necessitate Sunday labour; but as they were ready to undertake any amount of work that could possibly be done, it was their habit to wait for the last chance of the last hour of the week, and to keep the men waiting for their pay until that chance was decided—for if the men were suffered to go away before such expected order came, there would have been no means of collecting them again for the Sunday work. Over and over again have we seen hundreds of men and lads thus waiting for their wages until within a few minutes of midnight—their wives sometimes crowding the doors, and that in the bitterest weather, in the vain hope of getting hold of some portion of the husband's wage in time to avail themselves of the poor man's late market.

See what this system led to, and still leads to wherever it prevails. The weekly money not being forthcoming in time to be spent in the regular and lawful market, had to be spent in the irregular and unlawful one. Out of the late-pay system grew the Sunday morning market, to which the workers were driven to have recourse for the necessities of life. The business of marketing, and the subsequent domestic operations, which should have got themselves done on the Saturday, having now to be done on the Sunday, there was no time for religious services, and with multitudes of workers, especially in our great towns, the day of rest became from this cause alone a day desecrated by listless inaction and self-indulgence.

Whoever it was that first commenced the crusade for a Saturday half-holiday, he must, we imagine, have gone blindly to work—for if he had looked all the obstacles in the face, it is scarcely conceivable that he would have dared to assail them. For our part, we can remember the ridicule the measure provoked when it was first proposed. Nobody boasting any practical knowledge had any faith in its success. When the assumed advantages were explained to employers "they couldn't see it," but they saw something very different, as they imagined, in the shape of certain and serious loss. Even the working-men themselves looked on the idea at first as something Utopian, and though they gladly gave in their adherence to the plan, they did so with a don't-you-wish-you-may-get-it sort of an air, and a smile, rather of incredulity than of encouragement, sufficiently expressive of their private opinions. But, nevertheless, they began to think about it, to turn it over in their minds as they stood behind the counter, or wrought at the frame or the bench, and to draw pictures in fancy of running streams, and umbrageous woods, and cricket-bats and wickets, and floats bobbing at a bite, etc.; and at length, as such pictures grew familiar, they began to wonder whether there really was any reason why Saturday should always be a day and a half instead of a day, and whether it might not be just as sensible a thing to knock off five or six of its working hours in lieu of sticking as many additional ones on. By-and-by the plan grew to be discussed in the workshop and behind the counter with a larger measure of faith, and notions of its practicability began to be entertained and to spread. The chief reason of this was, that the Early Closing Association, which has always persisted in looking at obstacles through the

wrong end of the telescope, had been "pegging away" with its characteristic pertinacity, and had succeeded in driving its half-holiday heresy into the heads of some of the London employers who were known to be anxious for the welfare of their "hands," and in persuading them to give it at least a trial. The trial was made—in a sort of fractional way at first, by releasing a few hands for a few hours earlier on the Saturday evening. It was found that no harm came of it to the employer, while to the worker the benefit was manifest and undeniable: his holiday made him the fitter for work, and he was a better man during the week for the holiday that came at the end of it. Thus that venerable implement, "the thin end of the wedge," got itself fairly into the old knotty trunk of prejudice, and ever since then the Early Closing Association, and many good people besides, have been hammering away at it to drive it home. The wedge is not driven home yet—it will take a deal more hammering to do that—but it is bound to get driven home in time, and meanwhile we may congratulate ourselves on the good that has been done.

What has been done is this: in hundreds of working establishments where not very long ago the men and lads were accustomed to labour up to the very skirts of midnight, they now leave off at six o'clock, five o'clock, four o'clock, three o'clock, two o'clock,—and in not a few, but a good round number, the working week finishes on the Saturday at the working-man's dinner-hour, and he has all the rest of the day for amusement and recreation. There is no waiting for wages, because he is either paid on the Friday, or, better still, on the following Monday, so that he can be off at once to enjoy his holiday—to "bathe his eyes in green" in the pleasant country side—to cricket, to angling, to swimming—to the museum, the picture-galleries, the gymnasium, or to anything else (except shopping, as some do!)—thus crowning the week's hard labour with a chaplet of pleasure, in preparation for the reasonable rest and improvement of the Sunday.

But the practical question arises—How does the Saturday half-holiday system pay? Well, we are in a position to affirm that, taking all things into consideration, it pays even pecuniarily better than the old system of "all work and no play." We learn from those who have long tried it that quite as much work is got through in the week on the new half-holiday plan, both by men working by the piece, and men working by time, as was got through on the old plan—that the men earn as large a wage as they earned on the old system, and the master makes as large a profit, while his expenses are to some small extent less than they were on the old plan. The explanation would seem to be—and it is a perfectly natural one—that, with the half-holiday in view, men will make increased exertions, which, indeed, the effect of their holiday upon their health and spirits enables them to make. And it should not be forgotten, in connection with this matter, that the Saturday half-holiday generally puts to death that old enemy of the employer, Saint Monday.

We do not insist here upon the moral and religious advantage derivable to the worker by giving him a clear Sunday untroubled by the cares of the week, which it was impossible for him to enjoy under the late-hour system described above; but we commend this consideration to the conscience of every employer.

The above remarks have been suggested by the timely publication, by Messrs. Kent, of Paternoster Row, of a little book entitled "The Saturday Half-holiday Guide." We are not going to swell our columns with extracts from this book. The holiday-maker can

buy it for a few pence, and we recommend him to do so, seeing that it will show him how to make a profit of his holiday, whatever may be his personal preferences. It may chance to surprise him by the very various revelations it makes as to the pleasant uses to which a man may apply his available leisure. It may save him much waste of time by enabling him to plan his excursions beforehand; and it is very certain that by accepting its guidance, even for a single season, he may see and learn a great deal of which otherwise he would probably remain ignorant.

MY FIRST CURACY.

CHAPTER V.—THE PARISH CHOIR.

I MUST commence this chapter with the description of a very important body; at least they were so in their own estimation. I allude to the parish choir. When I first went into the parish as curate they still reigned paramount, for, as I have already stated, the vicar had only just previously been inducted into his living.

I think I never met with a more conceited set of people than were the individual members of this choir. I feel sure that Mulready's celebrated picture of "The Village Choir" could or must have been painted from some actual choir such as that of the church in which I first officiated.

There were men and women and children of every age, from the toothless chorus leader to the shrieking infant, and of all conditions of life; for instruments, always an important feature in such a choir, they had the flute, the violin, the double bass, and I know not what besides. With regard to the singing itself, if so it could be by the greatest stretch of the imagination be rightly termed, I must allow that the runs and shakes indulged in, and the prolonged notes sustained at the end of each verse, were most wonderful, not only to hear, but also to behold; at least the effects of these shakes were so; for the efforts to produce them upon the countenances of the actors, the contortions, the writhings made in order to keep up as long as those possessed with more powerful lungs were able to do; the red and purple faces indicative of apoplexy—all these efforts, so plainly visible from the reading-desk, produced the most painful effect upon the vicar, his wife, and myself. But the congregation themselves, from being accustomed to such exhibitions for many years, were happily totally oblivious of the impropriety of such exaltations of self in the worship of God.

Now I think my readers will agree with me, that if these were the kind of displays usually carried on every ordinary Sunday in the year, what outrageous proceedings would mark the services of the grand days on which charity sermons were preached by some local magnate. I remember, on one such occasion, soon after I had commenced my duties as curate, I was in the desk, the strange preacher and the vicar were inside the communion rails, that an anthem was sung after the third collect; there was a solo in it, which was sung by a female in the highest pitched key imaginable of a high soprano voice. As for the generality of the congregation, they looked on with silent admiration; while the members of the choir stared, as if they would have liked to have clapped their hands with delight. This expression of their feelings was evident in their countenances; but unfortunately for the lady herself, she got a little too high, and either cracked her voice, or so overstrained it, that she was only able to motion faintly for the

chorus to join in. So great was her emotion that she was gasping for breath, and had to leave the gallery. The chorus obeyed her behest, after a moment's pause; in fact, as soon as they were able to settle down after the wondrous display they had just witnessed. The whole performance was most lamentable.

As soon as the service was over, and the clergy and congregation had departed—the former to the vestry, to deplore such an exhibition, the latter to the church-porch, to applaud the vigour and talent of the singers—the leader of the band came hurrying in, in a great state of excitement; and with his face beaming with satisfaction and importance, he approached the vicar, with the words, "Was it not grand—was it not fine?"

He was quietly met by a face of utter blankness of expression, and with the words, "There certainly was a great amount of voice—the anthem must have been heard for a quarter of a mile, I should imagine."

"Thank you, thank you," quickly replied the man, taking the vicar's remark as a genuine compliment; he then hurried away, telling every one, with great glee, "that the vicar had given it as his candid opinion, that the anthem would be heard of throughout the country."

We resolved in solemn conclave that evening, that this exhibition must cease. But the difficult matter was how to arrange without giving unnecessary offence to any one. Of course, the band must at any cost be dismissed; but then the question naturally arose, what should we have in its stead?

Our unanimous answer was, an organ. Where was the money to come from to purchase one, for the farmers of the parish would be sure to fight shy of a subscription, and of course the mass of the people would follow their example. Before we broached the subject, therefore, in the parish, the vicar resolved to write to the squire upon the subject; for though, as I have shown, his personal character was bad, yet he had been liberal in matters relating to the church. We thought that if we could get him to head a subscription list with a good sum, that we might squeeze a little out of the scarcely squeezable pockets of the farmers. Accordingly the vicar wrote, and by return of post received the surprising and gratifying intelligence that the squire would undertake the entire cost of an efficient organ, and left it most generously to the vicar to state the dimensions and the price.

We kept this good piece of news an entire secret from the parishioners until the very day when the instrument began to arrive in most mysteriously packed cases. As may be easily imagined, the old choir was completely thunderstruck at the novel idea of an organ. They had considered themselves quite perfect.

Time would fail me to relate all the trouble, anxiety, and ill-will, that was incurred during the next few months; but at last the difficulties were overcome. Nor was there really any cause why the parishioners should grumble, especially as they were not asked to contribute a single shilling towards the erection of the instrument. Notwithstanding this fact, many were the openly-expressed wishes for its non-success, and for some time after its arrival it had to be most carefully guarded.

We succeeded in gaining over to our side one of the most intelligent members of the late choir, and persuaded him to go to the nearest town for lessons twice a week on the organ; and from being rather quick at learning music, and having a natural love for it, and perhaps, too, a little proud of the position the vicar meant to give him, namely, organist of the parish, he was quite able at the end of three months to play the instrument in so creditable a manner as to gain

applause from his enemies—from those with whom he had formerly joined in the old choir.

Now this old choir the vicar's wife tried to re-organise, but the opposition to the plan was so great from among the members of it themselves, that she was obliged to give the project up in despair. They were too conceited to learn any fresh method of singing, and so the idea was abandoned.

The next best plan which we fixed upon, as the more natural one had failed, was to train some boys and girls as quickly as possible, and meanwhile to restrain the old choir from using any but the plainest chants and tunes.

In this work of forming and training a choir we were fortunate in getting most efficient help from a single lady and her nieces who resided in the parish, not far from the church. They took every pains in their power to teach the members of the new choir the right pronunciation of the words, the proper division of the sentences, to keep correct time, and to sing in tune.

When at last the new choir was formally installed, the members of the old one had actually the bad taste to assemble in force on the first Sunday morning of its trial, and proceed to cough down each attempt they made to sing the hymns and chant the psalms; in the afternoon the same hostility was displayed, but the boys succeeded much better in their efforts; and on the second Sunday of their new undertaking, not being so nervous, nor meeting with quite so much opposition, there was a marked improvement.

When I left the parish, the choir, for a village one, was remarkably good, though preserving to the end a strong Devonshire dialect. In course of time many of the members of the old choir begged to be admitted, and by patience and perseverance on the part of the ladies who managed the different practices, efficiency up to a certain point was certainly obtained, and there was no village church choir like it for several miles round, as was acknowledged by our neighbours. But no one who has not had the management of a village choir can possibly tell the constant anxiety it is to those who undertake to organise one, and to keep it in order and up to the mark, when once it is fairly set on foot. Incessant watchfulness must be observed over each individual member of a village choir, or much mischief will be sure to arise, and months of careful training of their voices be entirely thrown away. The care of a parish choir is always more or less an unthankful task. Nothing but a strong sense of duty in promoting the decent and orderly worship of God could sustain in such an undertaking.

CHAPTER VI.—THE PARISH CLERK.

Our clerk was, as many village clerks are, a most eccentric character. I feel that I should not be doing justice to himself, but, on the contrary, committing an injury to his memory, if I did not devote an entire chapter to him and his doings.

I can give you a pretty accurate description of him. When I undertook the curacy, he was about fifty-eight years of age, but he had been clerk and deputy clerk for a period of thirty-five years. He had a wooden leg, was marked with the small-pox, his hair was iron-grey, he was about the middle height, neither stout nor thin, he had a kindly twinkle in his eye, and he was a tailor by trade. I must add that I liked him, and I think he was a general favourite.

What a fund of conversation he possessed; for William Strange was a great talker, but he was also a shrewd observer. "Ah," he said to me one day, "I have been clerk in this village more than thirty-four years, and I hope I am good for another fifteen, at any rate."

I asked him to give me the benefit of his long experience, which he kindly and cheerfully consented to do, very much in the following manner:—

"During the time that I have been clerk, I have seen no less than five vicars over this parish. All first-rate men, too, in their way; we never had a bad vicar, at least, not in my time. I don't mean *bad* in the moral sense of the word, but I mean that we never had 'a stick' (you understand what I mean, sir) in the pulpit, nor a fool in business matters.

"I do not, however, mean to say that all these five vicars were all equally good in every particular, 'taint likely; for instance, one was a better preacher than the others, another had a call for ruling a riotous vestry, a third was more affable and such like; but they were all noted for some good quality or another. I say *were* noted! why, bless them, some of them are alive and hearty now, in other parts of the country, and I hope, please the Lord, they may live in peace and plenty for many years to come!"

After a pause, the clerk resumed, "I said we had had five vicars in my time; let me recall them, for I can easily do that. The first was not much of a preacher, and kept himself much to himself, not seeing much of the people; but he was thought a great deal of by the Bishop and the gentry round. After him came a gentleman who had a most powerful voice: he was an eloquent preacher, he was; he had a beaming countenance, running over with the milk of human kindness. Ah, it was a sight, surely, to see our church then; why, sir, the people used to flock here on a Sunday afternoon for miles round; it was beautiful to see them coming across the fields in all directions. The third was a stately gentleman, in manners cold and distant, which, after the other warm-hearted man, made one feel the difference more; he was also of a delicate constitution. I have heard he was of a very high aristocratic family, and I know he had some grand people to see him, especially when he was ill. He died, sir, in that parsonage" (pointing to the vicarage, for during this part of our conversation we were sitting on the stone stile leading into the churchyard—nearly all our stiles were of stone). "Next came a gentleman who was very energetic. He roused up the people; but, poor man, the death of his wife and a bad cold seemed to shut him up all at once, if I may so say; and I did hear that at that time he lost a power of money in one of those bank swindles; and this threw him into a low way, and so he lingered for some years, and the parish went to rack and ruin. Then dissent spread, and our church got empty; but, poor gentleman, I know this grieved him sadly, but he could not help it, he could not do the work himself, and he was too poor to pay for a curate, and so things were left to themselves. Well, sir, after him came the present vicar, and I will say, before his face or behind his back, that he is a kind, persuasive gentleman, and he has got a good business head-piece, too, take my word for it.

"I would back my five vicars, take them all in all, against any other five successive vicars of any parish in Devon. Of course, they all had their failings (who hasn't?) and they were——"

I had to interrupt the worthy fellow in his eulogy upon the merits of his departed vicars, but upon the next day, taking the same direction for my walk, I met with him again, and after an interchange of common every-day civilities, I asked him various particulars about the parish and its inhabitants, and supposed he remembered, during the many years he

had held his clerkship, a good many incidents both amusing and instructive.

"Why, yes," he replied; "but I think our marriages have been among the strangest things I can remember. Perhaps, though, they are more commonplace now-a-days than they were formerly; parsons and people, too, are more particular; and the bishops also, they have looked into such matters rather recently—looked into them a little too closely, I think; the consequence is, that all those queerish, sly kind of marriages go to the registrar's office now for the performance of the wedding contract instead of coming to us. Why, the number of weddings in this church is now only one-half what they were before the year in which marriages were allowed at these register offices. That act has done a deal of mischief, and it's just the same with the registration of births. People are beginning to think that it will do instead of the rite of baptism."

Much more he said on this point, but not worth here repeating, as they were only such opinions as might be expected from a clerk of the old school.

"But I was a going to tell you," he continued, "something about our weddings. What a variety of characters come to be married, to be sure! Ah! I can picture one I once saw here in this church. She was a lovely creature, and no mistake—a perfect ball of snow, leaning on the arm of her stately, fine-looking old father, and followed by a string of pretty girls, all dressed exactly alike. And the carriages, and the nose-gays, and the footmen with the silk calves! But you must not suppose that many of our weddings are like that. Oh, no! we have some very poor ones indeed. I wonder why they marry at all, for I know sometimes they have to borrow the money to buy the ring with, and even the clothes they stand up in are often borrowed from a neighbour. Such silly young things, bringing trouble and children into the world almost before they have ceased to be children themselves.

"I remember one case in which a very shameful trick was played upon a woman by a man in our church. You know, sir, it is always our custom to have the intending couples into the vestry before the wedding takes place, in order to make the entry in the register, so that when the ceremony is over nothing remains to be done but the signing of the respective parties' names and the paying the marriage fees. In this particular case about which I am now speaking, the usual custom had been carried out, and the wedding party had left the vestry to proceed to the altar rails, when the gentleman turned quick round to the bride and said, 'I have left my handkerchief in the vestry, and will go and fetch it, for perhaps it will be stolen if I let it remain till afterwards!' Now there are two doors to our vestry, as you are aware; so the man goes into the one leading into the church, and out at the other leading into the churchyard. He never returned to fulfil his contract, and not one of the wedding party has ever set eyes on him since his disappearance into that vestry. The poor bride was very disconsolate, and would not allow any of us or her friends to comfort her, though he had shown by his base conduct that he was a worthless character, for he had actually succeeded in obtaining from her the money to pay the marriage fees with as they came into the church; she had also herself purchased the wedding-ring which she had just handed over to him. With both these articles he bolted, leaving the poor woman completely broken-hearted, at least for a time, at his atrocious conduct.

"One other bride I also remember lost her husband by a fearfully tragical event. The bridal party had all

arrived at the church, the clergyman was already robed, and time began to wear away and no bridegroom appeared. At last the impatience of the bride's father rose to such a height that he actually went over the way to the lover's lodging to learn the cause of the delay. Upon entering the young man's bedroom—he was a very respectable man, sir—to his horror and astonishment, he saw him stretched upon the floor perfectly dead. He had committed suicide!

"We have also had a few foreign marriages. Why they should have chosen this out-of-the-way spot I do not know, but I suppose they tell one another, and so hand the tradition down.

"You are aware, sir, that a marriage, to be legal in England, must be performed in the English language. Now sometimes it happens that the people who come to be married don't know a word of English, and have never perhaps been in an English church before, except to stare at the monuments; and they do not know what to do or what to say, and will put the ring on in the wrong place, and the women will put one on the men's fingers too, as they do (so I am told) in their own country, and there is a good deal of gesticulation and confusion and bother.

"And then there are sometimes absurd Christian names, men with women's names, and women with men's. And such breakjaw words, too—words with all the vowels taken out, and all the f's, and l's, and t's left in. But talking about absurd names puts me in mind that we have had some funny ones too in my time. Now what do you think of a Miss Pigge marrying a Mr. Hogg; or of a Mr. Catt marrying a Miss Mew? These are both facts, I assure you, sir; the latter wedding took place in the next parish, the former in our own. And perhaps you will hardly believe me, that I am telling you the truth, when I say that a Mr. Fox actually married a Miss Wolfe—but it's true, sir, it's in our register. Then again, a Mr. Summer married a Miss Winter. I was relating this fact to an old chum of mine, when he replied, 'I suppose the issue of that marriage was Spring?' That remark wasn't bad to my way of thinking. And I remember well, in a neighbouring town, a member of the Makepeace family marrying into the Goodwills. And the united family were so struck with the unanimity of the sentiment of their surnames, that they went into partnership and commenced shopkeeping, not twenty miles from this parish, and the strange sign-board drew them much custom, I know. I dare say, only my memory is beginning to fail me, that I could recall several such names. There was another wedding that now comes into my mind, in which a Mr. Gollup married a Miss Slush. When I ponder over these matters, I can't help believing that these couples were first attracted to each other by the oddness of their names; but of course I am not in their secrets, all I know is the result—marriage, and the fees."

Such was his practical way of looking at things, and our clerk was very practical; a spade was always to him a spade, and nothing but a spade. I must, however, now dismiss him from these pages, though in passing I must bear him the true testimony that he was a God-fearing man, which remark I have since found cannot always be applied to the officials round a church. It may be that familiarity with sacred things lessens the religious hold they ought to have and maintain; but with him it certainly never did.

He did not, however, live to fulfil his expectation of being "good for fifteen years or more," for he died in the summer after I left the parish, to the deep and sincere regret of all classes.

Varieties.

LUTHER MONUMENT AT WORMS.—The monument was inaugurated by the King of Prussia, there being also present the King of Wurtemberg, the Prince Royal of Prussia, the Grand Dukes of Saxe-Weimar and Hesse, Prince William of Baden, and an immense concourse of spectators. When the monument was uncovered, salvoes of artillery were discharged in honour of the event. The following telegram was sent to the King of Prussia by Queen Victoria:—"Pray express to the Committee for the erection of the Luther memorial my most hearty congratulations upon the successful completion of their task. Protestant England cordially sympathises with an occasion which unites the Protestant princes and peoples of Germany."

PALESTINE EXPLORATION.—The following statement by Lieut. Warren is not very promising:—"In studying the Holy Land it was most disappointing to find a dearth of evidence as to sites of places, and the more the matter was looked into the more difficult it became. There were points which were known beyond contradiction, such as Jaffa, Jerusalem, and others; but when details were sought there was the most conflicting evidence. All parties agreed that the Temple stood somewhere in a rectangular spot, called by the names of Haram and Moriah, and that the Mount of Olives was on the whole or part of a hill indicated on the map. It was probable, too, that the valley of the Kedron could be traced; but about all other points there were controversies; and if he made use of Biblical names in speaking of places, he did so because they were generally-received names, and not because they were established as such. The explorers must be content, he feared, to be baffled and perplexed for a long time to come before they could bring out Jerusalem as it was; for, startling as it might appear, they had not yet a single fixed point from which to commence. For instance, though the Temple was known to be on a particular space (the Moriah Area), yet there was space there for three such sites; and Mount Zion was put to the north of Moriah by some and to the west by others of authority."

PAPAL ALLOCATION.—In case any readers might take the following as a joke, it is right to state that the extracts are really from the Papal allocation delivered in the secret consistory, held on the 22nd June. "On the 21st December last, the Austrian Government passed an odious law to be carried out and strictly observed in every district of the empire, even in those districts where the Catholic religion exclusively prevails. That law establishes free liberty for all opinions, liberty of the press, of all faith, and no matter what confession or doctrine; it grants to the members of every confession the right of establishing public schools and colleges, and members of every confession are allowed to be admitted on the same footing with the sanction of the State. The same government on the 25th of May of this present year, issued another law which compels all the subjects, even the Catholic ones of the empire, deciding that sons born of a mixed marriage must follow the religion of the father, and the daughters that of the mother; and that under seven years of age they must follow in the stray path of their parent from the true faith. Moreover, the same law suppresses entirely the validity of the promises which the Catholic church, with reason and with the greatest justice, exacts and prescribes absolutely before the celebration of mixed marriages. It makes apostasy itself a civil law both as regards the Catholic religion and the Christian religion generally; it suppresses all authority of the church over cemeteries, and Catholics are bound to allow the bodies of heretics to be buried in their churchyard if they have not any of their own. Moreover, the same government on the said 25th day of May of this present year did not hesitate to promulgate a law on marriage which admits, and even confirms, that form of marriage absolutely condemnable, called civil marriage, when the authority of any confession whatever refuses the celebration of the marriage on grounds which are not admitted as valid, as legal by the civil authorities. It has also promulgated a law on education, which suppresses all the influence of the church over education, decreeing that the whole superior supervision of education, literature, and science, as also the inspection of schools, appertains to the State, which finally decrees that religious teaching in the public schools must be placed in the hands of members of each separate confession, that any religious society may open private or special schools for the youth of its faith; that those schools shall also be subject to the supreme inspection of the State, and that the

school books shall be submitted to the approval of the civil authorities; with the exception, however, of such books as are meant for religious instruction, books which must be submitted to the approval of the competent authorities of each confession. You see, consequently, venerable brethren, how necessary it is strongly to reprove and condemn those abominable laws," etc., etc. [Poor old giant Pope!]

HOW THE MONKEYS BECAME MEN.—Some of the savages in south-eastern Africa believe that the souls of their ancestors return to earth clad in the forms of monkeys, which, on that account, are petted and revered. The notion that men are in some way related to monkeys is not to be wondered at in untaught nations, and hence we are not surprised to find a peculiar view of it among the natives of western India. In one of the Government reports of the district of Kolhapoor, we find the following curious example of what we refer to. The extract is a translated essay on the origin of the Europeans and some other nations, and was produced during his examination by one of the Kolhapoor aspirants for a Government situation:—"Pleased with the conduct of his followers, the monkeys, while at war with Rawun, King of Lunka (Ceylon), Ramas wished to give them a banquet; but as the monkeys possessed no taste to appreciate the feast, he created two lakes, one having power to transform the monkeys on bathing into human beings, and the other to restore them to their original shapes. Eighteen leaders or chiefs of the monkeys, however, after the change, objected to their original forms, as they preferred remaining human beings; and to elude Ramas' resentment they had recourse to Seeta, his wife, who left them afloat on the great sea on eighteen *drones* (leaves formed into round platters), and gave them her blessing, that they should be supreme lords of whatever coast they might reach. The descendants of twelve of these transformed monkeys are now enjoying great power in the lands they respectively reached, and the *drones* were formed by them into hats, which they now wear on their heads. Their names are—

| 1. The Seikhs. | 5. The Alle. | 9. The Portakésee. |
| 2. The Masooseo. | 6. The Dutch. | 10. The Moguls. |
| 3. The Puntikal. | 7. The Firungee. | 11. The Chinese, and |
| 4. The French. | 8. The English. | 12. The Mah Chinese." |

We commend this Hindoo legend to the notice of our modern advocates of "the development theory."

WILLS AND SUCCESSIONS.—A Parliamentary return shows that in the financial year 1866-67 duty was paid in the United Kingdom on 42,173 probates of wills, letters of administration, and testamentary inventories. The number of deaths in the year may be taken as approaching 700,000, but more than half would probably be deaths of minors. It would appear, then, that about one in eight of the adults dying must have left personal property worth at least £100, the point at which the duty commences; and as the tax produced £1,735,868, the duty would average more than £41 for each case. But this is the "gross sum produced," and must probably be understood as paid on an estimate of the property before deducting for debts. A stricter test is supplied by the legacy duty paid. Legacy and succession duty were paid in the year on property amounting to £106,277,134—legacy duty on £74,383,693, and succession duty on £31,893,431. Legacy duty is not paid on property bequeathed by husband to wife, or the converse; but still the amount of property paying legacy duty in the year exceeded an average of £100 for every death, reckoning the deaths of men, women, and children.

PARISH FIRE ENGINES.—The Poor Law Amendment Act, 1867 (30 and 31 Vict. c. 106), which was passed in August of that year, contains an important enactment with respect to the manner in which fire-engines for parishes may be provided. As the enactment in question deserves to be known far more generally than it at present appears to be, we give it here at length. The 29th section of the Act enacts that "If the vestry of any parish, where there is no town council, local board, or other authority competent to provide the same, after due notice, shall resolve that the overseers shall provide any fire-engine, ladder, or fire-escape for general use in the parish, the overseers shall provide the same, and pay out of the poor-rate the cost thereof, and of procuring a proper place wherein to keep the same, and of maintaining it, as well as any such engine, ladder, or escape acquired by the parish in any other manner for such use, in a fit state of repair, and the charges of such persons as may be necessary for the use thereof, and the cost of suitable implements and accoutrements."

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

ATTACKED BY THE FRENCH FLEET.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XI.

OUR friends on board the Indianman were thrown into high spirits on hearing of the prospect of being released. They advised us, however, to get on shore again as fast as we could, and hide ourselves, lest the soldiers, hoping to be ultimately successful, should ill-treat us for having run away from them. We told them that our intention had been to release all the English prisoners, and to overpower the Frenchmen.

"Blood will be shed if you do, to no purpose,"

observed the judge; "should the frigate be successful and come back here, as I have no doubt she will, we shall be released; if the *Mignonne* escapes and returns, her crew would quickly again overpower us and obtain what they wish, a good excuse for ill-treating us, of which they will not fail to avail themselves."

The judge's opinion carried the day, and we hurried on shore, and returned by a circuitous route to the spot whence we had witnessed the engagement between the two vessels. William eagerly swept the dark, well-defined line of the horizon with his telescope.

"Hurrah! there is one—yes, there are two sails!"

Here, O'Carroll, see what you can make out of them," he exclaimed, handing him the glass.

It was some time before O'Carroll would pronounce an opinion. He then declared positively that there were two ships, and that they were approaching the land. There was a strong breeze. We sat down on the ground watching anxiously. They came nearer and nearer. We had no longer any doubt that the *Phœbe* had captured the privateer. The midshipmen declared positively that the largest was their ship.

"We ought to know her, though, to be sure, it is more of the inside than the out we see of her," observed Toby.

All our doubts were set at rest at length, when the British ensign was seen flying proudly over that of the French.

Three cheers burst almost involuntarily from our throats, which could hardly have failed to have shown our whereabouts to the French soldiers; but if they guessed the cause, they thought it prudent to take no notice of our proceedings, but, as we supposed, hurried back to their abodes, to conceal any property of value which they might possess. William and Trundle meantime were unable to resist the temptation of going on board the Indiaman, to give our new friends the joyful news. They said that they should be back in plenty of time to see the ships enter the harbour. O'Carroll and I preferred waiting to watch proceedings. At length the frigate and privateer got close in with the land, when both hove to. What was now to happen; boats were seen passing between the two vessels, and then the *Mignonne's* head came slowly round toward the mouth of the harbour, and on she glided towards it. The flags remained as they were, and men, we saw, were stationed at the guns. Some opposition was probably expected. There was a fort at the entrance of the harbour—not a very formidable-looking affair—with five ship's guns mounted in it. Round them we saw the greater part of the mongrel garrison clustering, as if they were going to show fight, but if so, they thought better of it, for after a short consultation, they sneaked away, leaving the fort to take care of itself. The *Mignonne* came gliding on, bearing evident traces in her masts and rigging of the punishment she had received, and of the obstinacy—or what would have been valour—in a better cause—with which she had been defended. We met the midshipmen running down towards the landing-place, and jumping into the first boat we could find, we got alongside her directly she dropped anchor.

"Why, Braithwaite, Trundle! where have you come from?" exclaimed several voices, as the midshipmen clambered up the side.

They soon gave an account of themselves, and I need scarcely say that we were heartily welcomed by the officers of the *Phœbe* in charge of the prize, who were in high spirits at having captured a vessel which had proved one of the greatest pests to British commerce in the eastern seas. The Frenchmen had not yielded till more than a third of their number lay dead or desperately wounded on her decks. Among them were several of the seamen of the unfortunate *Kangaroo*, including her wretched captain and mate. The survivors of the Englishmen declared that they had been forced on board and compelled to fight. We declined to express any opinion on the subject. All we could say was that we had missed them from the encampment, and had every reason to suppose that they had fallen into the hands of the French. They thus escaped hanging, which I certainly believe they deserved. The chief offenders

had already paid the penalty of their crimes. I need scarcely describe the delight of the passengers of the Indiaman on finding that they could now proceed on their voyage, or of the prisoners who were released from the different hulks. They were the officers and seamen taken in different prizes by the *Mignonne*. The excuse the Frenchmen gave for treating them thus barbarously was that the French taken by English cruisers were shut up on board hulks in English harbours without good food or any exercise. They pretended not to understand that, in one instance, the prisoners would inevitably have escaped had they been left at liberty, while in the present they had had no opportunity of escaping. The mouth of the harbour having been surveyed, the frigate came in the next day, that her crew might assist in repairing the *Mignonne*, and getting the Indiaman and the other vessels ready for sea. I was curious to ascertain what O'Carroll would say to finding *La Roche* at length a prisoner. I asked him if he would go on board the frigate with me to see the French captain.

"I would not do so to triumph over a fallen foe, but perhaps if I was to set eyes on him again for a few times, I might get over the intense dislike, even more, the dread I feel for him," he answered; "I have reason to feel dislike. He ruined my prospects, he killed my companions, and he treated me with every indignity and cruelty he could devise, while I remained on board his ship. He made me serve him as a menial, wait behind his chair, clean his shoes, arrange his cabin, and if I displeased him, he ordered his men to flog me. Ay, I never told you that before; I was ashamed to do so. He well-nigh broke my spirit. Had I remained much longer with him, he would have done so, or I should have gone mad and jumped overboard. Still I will see him."

We went on board the frigate and inquired for the privateer captain. Having already, it appeared, broken his parole in England when he had once before been taken, Captain Young had refused to receive it, and he was therefore confined below in a cabin, with a sentry placed over him. It was naturally supposed that he would otherwise take some opportunity of getting on shore, and knowing the locality, might remain concealed till he could escape from the island altogether. Accompanied by the master-at-arms we entered the cabin. *La Roche* was seated in an easy-chair, reading a book, when the door opened. He did not rise, but looking up, nodded to O'Carroll, whom he seemed instantly to recognise.

"Ah, mon ami, it's the fortune of war, you see. Once I had you in my power, now your countrymen have me," he said, in a cool, unconcerned manner. "It is pleasant, is it not?—pleasanter for you than for me. However, my turn may come next, and then——"

"I hope not. I hope, while I live, that I may never again be in your hands," exclaimed O'Carroll, interrupting him. "You remember how you treated me?"

"Oh, well, and it is in your power to inform the captain of this frigate, and probably he will treat me in the same way."

"No, indeed; Englishmen never treat their prisoners as you treated me," answered O'Carroll; "Monsieur knows that well enough. I did not come here to insult you. I did not come to triumph over you. You had inspired me with a horror I could not get over. I came here to be cured. I am so thoroughly. You have done much injury to the commerce of my country, and the only ill I wish you is that you may be kept a close prisoner till the termina-

tion of the war, and never again be able to do an injury to Englishmen."

La Roche shrugged his shoulders at this address and smiled. "Well, you Irishmen are indeed curious. I should have thought that you would have liked to have seen me hung up to the yard-arm," he observed, in the same cool tone as before. "However, your moderate wishes may be gratified, or I may make my escape, and if I do, and ever capture you again, I promise you that I will remember your moderation, and treat you to the best of everything I have on board."

We soon after this brought our interview with the famous privateer captain to an end, and O'Carroll assured me that all his unpleasant monomaniacal feelings with regard to him had been, as he hoped, completely dissipated. As we were about to leave the ship Captain Young politely invited us to remain and dine with him. He showed much interest in O'Carroll's account of his misfortunes, and finally arranged that he should take the command of one of the vessels in the harbour to convey the emigrants to New South Wales. I, of course, received no direct communication from Captain Hassall, but from the information Captain Young gave me I had great hopes that the *Barbara*, instead of sailing immediately for the east, had gone to the coast of Madagascar, in which direction the *Phœbe* herself was bound. Captain Young offered me a passage, should I wish to rejoin my ship. The Indianan being refitted for sea by the united exertions of all the crews we all sailed out of the harbour in succession, the *Phœbe* leading. The *Mignonne*, with her prize crew and some of the prisoners on board, was bound for the Mauritius, to give information of the capture of the island; the emigrant ship was bound for New South Wales, the Indianan for Calcutta, we for Madagascar. I went on board the *Argo*, the ship commanded by O'Carroll. I found him well satisfied with his change of circumstances. There was only one thing about which he was concerned. La Roche, though still a captive, was alive, and might soon regain his liberty.

"If he does, I'm sure that he will cause me trouble again," he observed. "I don't know what causes it, but I even now cannot think of the venomous little man without a feeling of dread, a creeping sensation, Braithwaite. Do you know what it is?"

"Not exactly," said I. "But the remedy I suggest is not to think of him. Wherever his image appears, banish him with a kick. Or, let me be serious, O'Carroll. Is it not our own fault if we go on living in fear of death all our life long? Put your trust in God, and fear not what man can do to you."

"You are right, you are right," exclaimed O'Carroll, warmly. "It is just the want of doing that has made me—no coward, as you know—constantly tremble at unseen dangers. Henceforward I will try to follow your advice."

"Do," said I. "And, depend on it, your dread of the little Frenchman will completely and for ever vanish."

I parted from O'Carroll, as honest a man as ever broke a biscuit, with the sincere hope that we should meet again. The crews of our respective ships gave three hearty cheers as we separated on our respective courses. We accompanied the *Mignonne* for some distance towards the Mauritius, when several sails were reported in sight from the masthead.

"I hope that they are enemies," I heard Trundle thoughtlessly exclaim. "Glorious fun to have a fight. We, too, should soon give a good account of them."

Both ships were speedily got ready for action, for in those days it was difficult to sail far without meeting an

enemy. It might be one to be captured—snapped up in an instant; it might be one of equal or not of vastly superior size, to be fought bravely, and taken in the end; or, mayhap, one so much larger that it would be necessary to make all sail and run away, a proceeding not very often practised in those days by British naval commanders. It was rather doubtful, however, from the number and size of the ships in sight, whether we should not find it necessary to have recourse to the last expedient. We continued, however, steering as before, and rapidly nearing the strangers, when, to the relief of the less pugnaciously disposed, first one and then the others made their number, and we discovered, as we got sufficiently near to exchange telegraph signals, that they were three frigates, the *Galatea*, *Racehorse*, and *Astrea*, on their way to the coast of Madagascar to look after a French squadron which, having been driven away from the Mauritius, had gone in that direction. We should now be a fair match for the Frenchmen whenever we should meet them. Having put most of our prisoners well guarded on board the *Mignonne*, we parted from her, she to continue her passage to the Mauritius, we to accompany our consorts in search of the enemy.

Everybody on board was in the highest spirits. Strange that the prospect of a fight, when blood must be spilt, life lost, suffering undergone, should be so congenial to the taste of human nature. I have always considered this a strong evidence of our fallen condition, and of the folly, the dulness of perception, which that condition has produced on the mind of man. What can be more contrary to sound wisdom, I may say to ordinary good sense, than the desire to kill and hurt others, or to run the risk of being killed or hurt? A bright look-out was now kept for the enemy, and from sunrise to its setting the mastheads were adorned with eager watchers, each wishing to be the first one to espy the Frenchmen. However, the lofty mountain ridges of Madagascar hove in sight before any of them were seen. I had become very anxious about the fate of the *Barbara*. Had she prosecuted her voyage to this coast, and fallen in with the enemy? If so, she must have been captured, and too probably sent away to one of the settlements. In spite of my advice to O'Carroll, this idea took complete possession of my mind, and I felt convinced that the voyage from which so much had been expected would come to nought. Night closed in on us, and the usual answer was given to the watch below by those who had come off deck, "Not a sign of a sail in sight." The next morning the sun arose out of his ocean bed brighter even than is wont in that bright clime, first lighting up the topmost heights of the mountains with a roseate tinge, while a purple hue still lay spread over the calm ocean. As usual, officers and men were going aloft, with telescopes over their shoulders, to take a look round for the enemy, when, as the sun rose higher, a shout of satisfaction burst from many a throat, for there lay, well in with the land, their white canvas shining brightly in his beams, the French frigates of which we were in search. The wind came off the land, and we were far to leeward. They thus had greatly the advantage of us. We did our utmost, however, to beat up to them. Every sail that could draw was set, and we continued to tack and tack hour after hour, hoping to reach them, and that some fortunate shift of wind would give us the weathergauge and enable us to choose our own time for action. As I went along the decks I was struck by the bold and determined appearance of the men as they stood at their quarters, stripped to the waist, and mostly with handkerchiefs

of many colours tied round their heads. The costume was appropriate, for the heat was excessive, besides which, sailors know well that the suffering is much less should they be wounded if no pieces of cloth are carried into the body with the shot. They were chatting and laughing, and many of them were cutting all sorts of jokes. I had volunteered to serve as the captain's aid-de-camp, to carry messages for him to any part of the ship, or to assist the surgeons in the cockpit.

"You would do good service on deck, and I respect your feeling in offering to be there," he answered, "but you are a non-combatant. You have nothing to gain by exposing your life. You will therefore oblige me by performing the far more painful task of assisting the surgeons."

I bowed with a feeling of disappointment at my heart, which I probably exhibited.

He smiled and said, "It is possible, after all, that there may be very little employment for your talents."

There was a shout on the upper deck, taken speedily up by the men on the main deck. The enemy were seen bearing down on us. On they came, nearer and nearer. Where we lay it had fallen a perfect calm, and our sails kept flapping against the masts. Still the breeze favoured them. I felt very queer, I confess. I had no intention of going below till I was wanted, and it did not occur to me that I might be turned into a patient myself. The delight of the sailors at seeing the French thus boldly approaching was excessive, nor did they fail to praise them for their courage.

"Bravo, Johnny Crapaud. That's more than I thought of you. Come along. Don't leave us again. We won't hurt ye more than we can help. You are brave fellows, that you are; we always thought so. Now you show it. Bear a hand, though."

I heard such and similar expressions from most of the men as I passed along the decks. Suddenly there was a gloom from one end of the ship to the other. The breeze which had been bringing the Frenchmen along, suddenly dropped. It had served them, however, well enough to bring them pretty close up to us.

"Now," I thought to myself, "I shall see what a regular stand-up sea fight is like."

Still I could not help feeling all the time that my vocation was one of peace, and that I had no business to be where I was. That is not a pleasant sensation. The great thing for a man to feel in time of danger, is that he is at his post and doing his duty. As I was in for it, I determined to do my best to be of use, and to trust to the God of mercy for protection. The enemy soon showed us that they had no intention of being idle. A shot came whistling over our heads, and fell a considerable distance on the other side of us. This showed them that we were within gun-shot range of each other, and immediately they opened fire in earnest. Some of the shot flew over our heads, others on one side or the other, but hitherto none had struck us. I had a hope that, after all, there would be no bloodshed. We meantime had commenced firing, but either the Frenchmen's powder was better or their guns longer, for our shot mostly appeared to fall short, greatly to the vexation of our crew. The enemy also having had the last of the wind, while we were becalmed, were able to take up a better position than we had, and continued warmly engaging us, we often being scarcely able to return a shot. As I had nothing to do below, I remained on deck. More than once, however, I could not help ducking my head as a shot whistled above it. Possibly it might have been too high to have struck me. However, I soon got accustomed to that, and as no one had as

yet been hurt, I began to fancy that after all a sea fight was not so terrible an affair as I had supposed, and that possibly we and the Frenchmen might part without doing much harm to each other. I had been standing near a fine young fellow, Jem Martin by name, captain of a gun, who had for some time past been cutting, with more than ordinary humour, numbers of jokes on the enemy. I was struck by his bold attitude and thoroughly sailor-like look. His bright blue eye beamed with life and animation. I had turned my head away from him when a shot whistled by, and I heard a piercing shriek, such as a strong man utters but once, wrung from his bosom by mortal agony. I looked round, and on the deck lay the shattered body of a human being. There were a few spasmodic movements of the limbs, and all that remained of Jem Martin was the mangled corpse at my feet. I shuddered, for I could not help feeling that such as he was I might now have been. The event seemed to affect his shipmates but little; another seaman took his place, and the gun was loaded, run out, and fired. The fact was, that they had no time just then for thought or the indulgence of feeling. The enemy's shot now came thicker and thicker. Many went through the sails, others wounded the masts and spars and cut away the rigging, and several more of our men were hit. As soon as they were carried below, I followed, to assist the surgeon in attending to their wounds. I had long before this forgotten all about the danger to which I was myself exposed, but I could not forget that I had a young brother on board who might any moment be numbered among the killed or wounded. It seemed to me, indeed, that we were getting so much the worst of it, that I began to dread that the flag of England might have to strike to that of France. The idea was not a pleasant one. It was not, however, shared in by others on board.

After we had received a pretty severe battering for the space of two hours, the breeze got up and the Frenchmen hauled off to repair damages. On seeing this, the rage of our men became very great, and they cried out to the officers that they might be allowed to go after them. As the enemy were to windward, this was not easily to be done, and we had to wait patiently in the hope that the enemy would choose to renew the fight, while in the meantime our top-men were knotting and splicing rigging, and the carpenters' crew were strengthening the wounded yards and stopping shot-holes. At length the breeze reached us, and as it filled our sails the crew cheered in anticipation of being able soon to get to closer quarters with the enemy. After making numerous tacks, two of our squadron got up to two of the French ships, which seemed in no way disposed to refuse battle. While our gallant commodore closed with the *Renommé*, we engaged the *Clorinde*. The fight soon gave work for our surgeons, and I went below, as I had undertaken to do, to help them. As I left the deck I cast a glance at my young brother, who had charge of a division of the guns, and was standing on the deck cheering on the men, full of life and animation. The shots were thickly flying about his head. Any moment one might lay him low. I could but offer up a prayer for his safety.

The surgeon and his mates were already at work. I hung up my coat and tucked up my sleeves prepared to assist them. I will not describe the scene of suffering I witnessed. Most of the poor fellows bore their agony with wonderful fortitude. Two officers had been brought below wounded. I kept looking up anxiously every time I saw the feet of men descending the ladder, dreading that they might be bringing down my young

brother; still I kept praying for his safety while I followed the surgeon's directions. A young seaman had been brought down fearfully wounded. I had remarked him on several occasions among the most active and zealous of the crew. The surgeon examined him. He did not groan; indeed, he did not appear to suffer much pain.

The surgeon shook his head. "I can do nothing for him," he whispered to me. "You may be able, perhaps, to speak a word of comfort, and there is nothing just now for you to do."

I was rather surprised at the surgeon saying even thus much. Perhaps the light of the lantern, which at that moment fell on my countenance, revealed my thoughts, for he added—

"I was asked to look after the lad, whose mother is a widow, and, God help me! I have done little for him, and now it is too late."

The young seaman was placed on a hammock opened out on the deck of the cockpit. I knelt down by his side, and after repeating such passages out of the Word of Life as occurred to me, I engaged in prayer. He followed me in a low voice. Suddenly he was silent. I looked towards him. The immortal spirit had taken its flight from his frail body. Still the battle raged. More of our poor fellows were brought down, and I once more was called on to assist the surgeons in their painful task.

AN ALLEGED POEM BY MILTON.

THE announcement of the discovery of an unpublished poem by Milton has caused much interest and discussion. Professor Morley, of University College, found the lines, written on a blank page in the volume of Milton's "Poems both English and Latin," in the British Museum. Of this volume, which contains "Comus," "Lycidas," "L'Allegro," and "Il Penseroso," there are two copies in the Museum, one in the General Library, and the other in the King's Library. The poem is in the latter copy, which has been less frequently examined. Mr. Morley affirms that the poem is in Milton's handwriting, and maintains its genuineness also on internal evidence. Professor Masson, on the other hand, asserts that the poem, which he copied some years ago in preparing his "Life of Milton," is not in the poet's handwriting, and is unworthy of his pen. Manuscript experts, such as Mr. Bond, keeper of MSS. in the Museum, and Mr. Rye, assistant-keeper of printed books, have given adverse opinions. The genuineness of the poem itself has been much debated, but without satisfactory result as yet. Those who repudiate the poem as unworthy of Milton, have done so on grounds of faulty rhyme and minor details, to meet which parallel quotations have been given from other of Milton's minor poems. The reader must form his own judgment. Here is the poem, with the spelling modernised.

AN EPIGRAPH.

He whom Heaven did call away
Out of this Hermitage of clay,
Has left some reliques in this Urn
As a pledge of his return.

Meanwhile the Muses do deplore
The loss of this their paramour,
With whom he sported ere the day
Budded forth its tender ray.
And now Apollo leaves his bays
And puts on cypress for his bays;
The sacred sisters tune their quills
Only to the blubbering rills,

And while his doom they think upon
Make their own tears their Helicon;
Leaving the two-topt Mount divine
To turn votaries to his shrine.

Think not [reader] me less blest,
Sleeping in this narrow chest,
Than if my ashes did lie hid
Under some stately pyramid.
If a rich tomb makes happy, then
That bee was happier far than men,
Who, busy in the thymy wood,
Was fettered by the golden flood
Which from the Amber-weeping tree
Distilleth down so plenteously:
For so this little wanton elf
Most gloriously enshrined itself.
A tomb whose beauty might compare
With Cleopatra's sepulchre.

In this little bed my dust
Incurtained round I here intrust:
While my more pure and nobler part
Lies entomb'd in every heart.

Then pass on gently, ye that mourn,
Touch not this mine hollowed Urn;
These Ashes which do here remain
A vital tincture still retain;
A seminal form within the deeps
Of this little chaos sleeps;
The thread of life untwisted is
Into its first existencies;
Infant nature cradled here
In its principles appear;
This plant though caverned into dust
In its Ashes rest it must
Until sweet Psyche shall inspire
A softening and prolific fire,
And in her fostering arms enfold
This heavy and this earthly mould.
Then as I am I'll be no more
But bloom and blossom [as] b[e]fore
When this cold numbness shall retreat
By a more than chymick heat.

J.M., Ober., 1647.

A LADY'S JOURNEY THROUGH SPAIN.*

CHAPTER I. GERONA. BARCELONA.

HAVING spent the greater part of a year in Spain, I purpose in the following articles giving some notes of my travels. I had opportunities of observation not enjoyed by all travellers, through a family of high rank, whom I had known intimately at Naples. When my purpose of making a lengthened residence in their country became known to them, there was no possible assistance they did not procure for me in the way of introductions, advice, and facilities of all kinds.

We left England early in April, our party consisting of two ladies and two gentlemen. I pass over our journey through France, and begin the extracts from my note books at the time of our arrival at Perpignan. At this small fortified town, on the French side of the Pyrenees, we spent the night, and on the following morning we began the ascent of the not very frowning barrier that there separates France from Spain. A

* In the papers entitled "Two Months in Spain" (Leisure Hour for May, June, and July,) a brief record is given of a tour made in the months of November and December last. In the present series of papers another Spanish journey, of earlier date, but of wider range, is described. The reader will thus possess recent and accurate information about a country less visited by tourists than most other parts of the continent. The "Lady's Journey" having been made on muleback or by travelling carriage, more of the country was seen than in the two months' tour, which was chiefly determined by the great lines of railway. In the following articles, to avoid repetition, much must be omitted, especially in regard to the great towns described in the previous tour.

zigzag road ascends the mountain, smooth and well kept, with strongly-built walls on the side of the precipices. At certain distances there were white posts, having inscribed on them the distance both to the Spanish frontier and to Perpignan. Two white pillars on either side of the road mark the political division between the two countries; but it is no less singular than true, that the dwellers on one side of the pillars, not a hundred paces from the dwellers on the other side, are as different as though a wide sea rolled between them. On one side are active, chattering little men, and brisk Frenchwomen in mob caps of spotless purity; while on the other side there is the Spanish costume, the Spanish language: the very air is Spanish, the people moving about with the grave, almost dignified bearing of the Catalonians. At the very next stage, the horses brought out and harnessed to the carriage seemed of an entirely new race. They were bony ill-used creatures, chafed by the ill-made harness, and in all ways very inferior animals to the closely shaven mules, their companions, whose tinkling bells reminded us perpetually that we really were in Spain.

The scenery, though less wildly picturesque than that of the other passes into Spain, is pleasantly varied, the road winding in and out of narrow defiles, with many a recollection of robbers in bygone days. To the right is the splendid peaked outline of the Pyrenees, some of the snow-capped peaks standing out clear against the blue sky, while on the left we had an occasional glimpse of the beautiful Mediterranean. Scarcely an eminence is passed that has not some ruins of an old tower or massive keep, each with its own peculiar tale of dread and horror. The road crosses several mountain streams, the course of which is in summer only marked by the dry bed of the water, but in autumn and winter, in the time of the heavy rains, they increase to a great size, and are sometimes impassable.

The little villages, exposed for so many centuries to perpetual invasion, would have, at ordinary times, a most ruinous and desolate appearance; but the groves of almond-trees that surrounded most of them, now in spring all covered with their pale pink blossoms, with a profusion of other fruit-trees also in bloom, gave altogether quite a festive air to these otherwise melancholy hamlets. It was one of the numerous holidays occurring in a Roman Catholic country; and all the inhabitants seemed to be wending their way to Gerona dressed in festive attire. There were waggons drawn by patient sleek oxen, with their heads fastened together most uncomfortably; and under the wagon-cover might be seen a cluster of merry faces, with bright dark eyes and sunny complexions, all evidently bent upon enjoying themselves. Troops of sleek mules jingled along, each bearing two or more riders; and we passed hardy Catalanian peasants on foot, with the staff peculiar to the district in their hands, shouting out, in their fine sonorous language, wild national airs in chorus. The hills were thickly clothed with olive and cork trees, the silvery white of the one contrasting finely with the cinnamon-hued trunks of the others.

At last we were told we were approaching Gerona, our sleeping-place for the night, and as it was to be our first experience of a Spanish inn, it may be supposed that we felt a little nervous respecting what might be awaiting us. As our carriage rattled over the stones, going full gallop through the streets—a practice common to Italian and Spanish drivers—our wonder was great to see the lumbering diligence which preceded us getting along the streets at all, so very narrow did they appear to us; but on the great unwieldy machine went, and

on we went, till we pulled up at the entrance of a covered courtyard. It was so crowded that our carriage could not drive in, so we alighted and made our way into the inn. The mistress, a pretty bustling little woman, was voluble in her regrets that we should have arrived when every inn was full to overflowing; but still, she assured us, she could take us in, and, moreover, make us comfortable. On the faith of this assurance we followed her up-stairs and into a room with a red-tiled floor and a great paucity of furniture, but the spotless white window curtain gave some indication of cleanliness. I signified our approval so far, but on my putting the question to her where the other rooms were, she expressed the profoundest astonishment at our unreasonableness. What could the senores want with more than one room? and such a beautiful room! Was there not the image of the Virgin under a glass case? and were there not curtains? She could not comprehend our unreasonableness; but we meant to have our own way, notwithstanding, and at length, with great difficulty, we persuaded her to let the two gentlemen sleep in the corridor or *salle à manger*. Having settled that matter, as we thought, we sallied forth to look about us.

Gerona stands high, exposed to the north wind, but overlooking a bright sunny plain; it has often, from its importance as a frontier military position, been laid siege to, and its singularly wild and fierce inhabitants have always shown themselves ready for emergencies. This mountainous district has always sheltered bandits, contrabandistas, and guerilleros, from the earliest ages. The town traces its origin back to the most remote antiquity. It is a quaint old place, with a deserted look, as if it had just been evacuated by an enemy. A narrow winding lane led us to the summit of the hill, where stands the magnificent old cathedral. In the Spanish account of this fine edifice, it is stated that twelve architects of the greatest celebrity met in solemn deliberation, for many weeks, to consider what plans to adopt; this shows the serious consideration given to the elevation of these mighty structures in old times. The approach is very fine: a superb flight of eighty-six steps leads up to the front entrance. The see is said to have been founded as far back as 786, by Charlemagne. Service was over, but a faint smell of incense still lingered, an "odour of sanctity" particularly agreeable in Spain, where garlic pervades the very air one breathes. A side door leads to the beautiful old cloisters, built round a garden, which no doubt was once adorned by beautiful flowers, under the care of the departed monks. The abandoned monasteries throughout Spain are most sad to see, though certainly no country has gained more by the secularisation of the monks. Still the antiquarian cannot but mourn over many picturesque beautiful old buildings sinking gradually into decay.

Emerging again into the quiet streets, we saw peasant girls bringing home flocks of goats from the hillside, where they had browsed all day. Each goat seemed well acquainted with its own habitation, and quietly walked in on reaching the door. In the market-place there seemed congregated all the gaiety and animation in the place. As in most Spanish towns, the principal square had arcades all round. The women looked very picturesque in their white lace mantillas, though the black one, I think, is far more becoming; the men seemed all to have put on their new caps, so brilliant were their hues—brightest crimson, purple, and true Spanish brown. The proper arrangement of these caps, which in shape resemble an old-fashioned white cotton nightcap, seemed of the greatest importance, and to be

the true sign of a Catalonian dandy. There was a group surrounding a handsome lad, and arranging his brilliant carmine cap in half a dozen different fashions ere they were satisfied with the general effect. All sorts of cakes and fritters were cooking over the portable charcoal stoves, ears of the beautiful maize were roasting in odd black pots, while iced drinks of all kinds were in shrill voice offered to the gay throng.

The Catalonians are a robust, sturdy, fine-looking race, their appearance suiting well with their character. At one time, nearly the whole population belonged either to the smuggling or to the robbing part of the community; in more peaceful times they have retained their spirit of independence and their courage, but the progress of civilisation and the increase of honest employment for the working classes have brought about considerable improvement, and more may still be looked for in due time. Our first Spanish dinner was certainly not very attractive: *puchero* (bread floating in greasy soup), fish so stuffed with garlic as to be uneatable, very indifferent fowls, and omelette full of saffron, which is much used in Spanish cookery. When the hour for retiring arrived, our gentlemen, in spite of the landlady, spent the night in the draughty *salle à manger*; and a most unquiet night they had, as they were so near the street, that all night long they could hear the noises of the *fête* going on in full force; certainly they were not sorry when the daylight appeared.

Early in the day, we went to have a farewell sight of the grand old cathedral. A single priest was officiating at matins, crowds of working men, and women with picturesque white serge hoods on, were kneeling on the pavement, commencing their day with thanksgiving. It may be only outward seeming, but still it impressed us very much, to see such numerous attendance at the service. The prayers did not last long, and men and women, as they went away down the beautiful approach, stopped and gave friendly greeting as they passed to their acquaintances. Many of the women, as they went home, stopped at the bakers', and slung on their arms one or more large circular bracelets or armlets of loaves, for that is the form in which bread is made in this neighbourhood.

We only returned to our inn to pack up, and start for Barcelona by rail. The country we passed through was truly delightful, a constant interchange of hill and plain, well wooded, watered by rapid mountain torrents, whose banks are fringed with gigantic reeds, much used for thatching the houses, for fences, and other purposes. The railroad for some distance runs so close to the sea, that there is but just room for the road between it and the row of houses built along the shore. It was a sunny scene; the blue sea on one side, the rich maritime country on the other, with the beautiful gardens of orange and lemon trees, fenced round by the aloes, forming an impenetrable barrier. Here there is little to be seen of poverty. Everywhere the women are busy knitting, the men either working as labourers, or else, in their picturesque craft, fishing. Here and there the hills open out, and, embosomed among groves of fruit-trees in full blossom, are the luxurious villas of the wealthy merchants of Barcelona. Later on in the year the dryness of the air and soil must rather interfere with the verdure, but in the early spring, as we saw it, it was a scene of great loveliness.

Barcelona is a very fine town, one of the finest in Spain, and from its manufactures it has a more stirring air than most Spanish towns; and the port, crowded with shipping, adds to the general bustle and movement going on in the place. We went at once to the *Fonda*

del grande Oriente, by reputation the best inn in the place, and we had no reason to repent our decision. We were not here troubled by the *senora* or mistress insisting on packing us all into one room, but found excellent accommodation for all the party. Of course it was a saint's day. After some months' travelling in Spain, I came to the conclusion that the saints' days were the rule, and ordinary days the exception. The beautiful walk whither we at once bent our steps, the *Rambla*, was filled with gay crowds. The Catalonians are much more industrious than the enervated inhabitants of the country farther south; they are said to be the richest of the Spaniards, and they certainly deserve to be so, for even a traveller remaining any time in the country must be struck with admiration at the sight of all that their industry has effected. The rocky soil is improved, terraced gardens are made where one would not have supposed anything could have been produced, and the pursuit of fishing, for which their extent of sea-coast affords ample opportunity, is carried on with the greatest skill and success. The Catalonians live on the water, and are reckoned the best sailors in Spain.

One taste nearly all Spaniards share alike—their inordinate passion for lotteries: not a village does one pass through, but it has its lottery office. Young and old, men, women, and children, will resort to any possible expedient to obtain the money necessary for the purchase of these lottery-tickets. They are entirely under government direction; and it is supposed that they bring in considerable revenue. It has a very bad effect upon the lower orders, serving to keep up a perpetual state of excitement, and causing many of them to rely entirely upon fate, instead of on their own exertions. The most absurd trifles will serve to determine their selection of what they imagine will turn out a lucky number.

I was delighted with the town and its environs. There are countless villas buried among groves and gardens, in which grow the orange, the citron, the pomegranate, and other fruits of southern climates. To one of these enchanting retreats we were fortunate enough to pay a visit, one of my companions having an introduction to its hospitable owner, the Portuguese consul. It was situated between two and three miles from Barcelona toward the mountains. The saloon in which the dinner was laid out looked out upon a garden, sparkling with numerous fountains throwing their clear waters high up in the air; the view of the rich plain, and the city of Barcelona in the distance, with the blue Mediterranean, was enchanting. The sea was dotted with those picturesque lateen sails that are so associated with the Mediterranean.

"The Torres," as these country seats are called, situated on the slopes of the hills, overlooking such a prospect, certainly combine every possible attraction that can add to the enjoyment of their possessors. There would we sit on the lofty terraces overlooking the rich and varied plain, the distant city gilded by the setting sun, and the sea beyond, or at times we would linger on till the moon was risen, and see the same scene under the influence of that soft solemn light, the nightingales making the very air musical with their song. Nothing can be purer, and softer, and sweeter, than the evening air inhaled in these favoured retreats.

We had loitered long enough at Barcelona day after day, and we therefore made our arrangements for departure with great regret, in spite of all we had before us. We intended going to Zaragoza, as we much wished to see a city so full of interesting associations with the

past: we therefore hired a very fairly comfortable open carriage, and made arrangements with a good coachman to take us thither.

THE MIDNIGHT SKY AT LONDON.

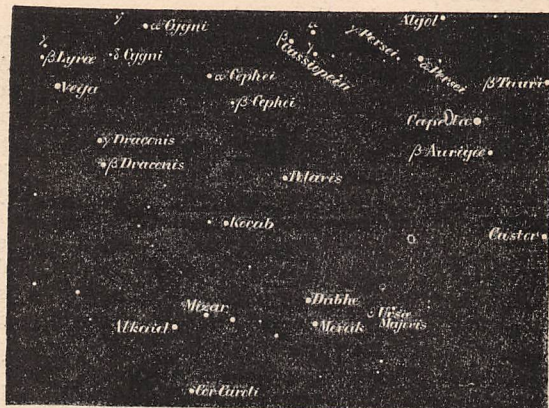

SEPTEMBER.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

DURING the last few years, many valuable additions to astronomical knowledge have been made by the telescopic observation of the spectra of the stars, and by the discovery of certain analogies, or coincidences, between these spectra and those found from the spectroscopic observation of the heated vapours produced by the combustion of metals and gases. A celebrated German physicist, M. Kirchhoff, was the first who drew particular attention to the subject, by the publication of an elaborate paper on the solar spectrum. In this paper, he gave the results of experiments, made by himself and M. Bunsen, on the spectra of vaporised metals, from which he concluded that the bright lines observed in the spectra of the intensely-heated vapours of copper, iron, magnesium, and other substances, coincided in their positions with some of the dark lines usually observed in the solar spectrum, known generally by the name of Fraunhofer's lines. From these experiments, M. Kirchhoff propounded a probable hypothesis, that these metals in a state of vapour are contained in the sun's photosphere. What the German *savans* did towards giving us some general idea of the chemical constituents of the solar envelopes, so Mr. Huggins and Dr. W. A. Miller in England, M. Secchi at Rome, and others, have, by similar research, added to our previous knowledge of the probable composition of the photospheres of the stars. When a ray of sunlight is made to pass through the prism of a spectroscope, it is decomposed into its primitive colours, forming the brilliant solar spectrum. Independently, however, of these colours, a series of dark lines are visible over the whole spectrum, numbering several hundreds, some being extremely fine, and others of a sensible breadth. For convenience of reference, the broad lines have been named after the letters of the alphabet, and their positions with respect to each other are invariable. In the observations of the bright lines in the spectra of vaporised metals, it has been found that one metal gives one series of lines, another a different series, each spectrum, in fact, having lines peculiar to the metal employed in the experiment. Kirchhoff and Bunsen having observed that the positions of the bright lines of the vaporised metals coincided with those of some of the principal lines of the solar spectrum, viewed the metallic spectra through less intensely heated vapours of the same metals, when the bright lines were observed to be changed into dark lines. From this it has been inferred that Fraunhofer's dark lines are produced by light emitted from a photosphere heated to incandescence, containing metals in a state of vapour, the bright lines being transformed into dark lines by absorption while the rays of light are passing through a less heated atmosphere or envelope of the sun.

The stars all give a continuous spectrum similar to that of the sun, but the distribution of the visible dark lines varies considerably. The order of the stellar spectrum depends, to a great extent, on the colour of the stars, and M. Secchi has classified his observations in this manner. For example, all the white stars, such as Sirius, Vega, and Spica, are marked by a broad line near the position of the line F in the solar spectrum, and

another at the violet end, while the red stars, such as Arcturus and Capella, have a spectrum covered with fine lines which occupy the place of the principal lines of the solar spectrum. In Sirius, near the extremity of the red part of the spectrum, there is also a very sharp and precise line similar to that near the position of the

INDEX-MAP, LOOKING NORTH, SEPTEMBER 15.

line F. Between it and the line D, or sodium line, which is easily perceived in the spectrum of Sirius, a tolerably broad but somewhat nebulous band can be seen. Several fine lines in the green have also been noticed. A few *bright* lines have been found in the spectra of a few stars, indicating the presence of hydrogen, or other gases, in a luminous condition (see page 379). Taking Aldebaran as a type of many others, it may be stated that the photosphere of that star probably contains among its constituents the following metals and gases, or their vapours: sodium, magnesium, hydrogen, calcium, iron, bismuth, tellurium, antimony, and mercury.

Mr. Huggins has analysed the light of several nebulae and stellar clusters. From his observations it has been found that these faint cloud-like objects can be divided into two classes, one which gives a continuous spectrum

INDEX-MAP, LOOKING SOUTH, SEPTEMBER 15.

like the sun and stars, and the other a spectrum of only a few bright lines, indicating the gaseous nature of the nebula. We have thus the means of distinguishing at once those nebulae which can be resolved into stars, from those which are unresolvable. The great nebula in the sword-handle of Orion is one of the latter, showing a spectrum of three bright lines, and it can

never therefore be converted into stars, however powerful the astronomical instrument employed may be.

We will now describe the lower diagram representing the midnight sky south of the zenith in the middle of September. The chief constellations above the horizon are Aquila, Vulpecula, Delphinus, Equuleus, Capricornus, Aquarius, Pisces, Aries, Pegasus, Andromeda, Cetus, Triangulum, and portions of Cygnus, Lacerta, Taurus, Orion, Eridanus, Sculptor, and Piscis Australis. The chief stars are Altair, Aldebaran, Fomalhaut, and the four stars composing the square of Pegasus.

Cassiopeia occupies the zenith, but south of that point there are no large stars for several degrees. Looking due south, we shall find that the stars in the square of Pegasus are now at their highest point, Beta Pegasi and Markab being slightly west, and Alpherat and Algenib east of the meridian. Jupiter is, at this time, a conspicuous object in Pisces below the square. West of the zenith, the stars in Lacerta, Cygnus, Vulpecula, and Aquila, can be noticed, the three chief stars in Aquila being in the W.S.W., and on the right-hand side of the diagram. In a south-westerly direction, beginning at the zenith, we pass over a part of Andromeda, Pegasus, Aquarius, and Capricornus, and very near the horizon in the S.S.W., the position of Piscis Australis, indicated by its principal star, Fomalhaut, can be found. The sky on this side of the meridian is not very brilliant at this time, although there are a large number of stars of the third and fourth magnitudes. If we now consider the eastern sky, which will soon be so rich in conspicuous objects, we shall find that the major part of Andromeda is east of the meridian, including all its principal stars. Alpha Andromedæ, or Alpherat, being the north-eastern star of the square of Pegasus, can readily be distinguished, Beta is a little to the north-east, and Gamma a short distance farther in the same direction. By prolonging a line drawn from Markab to Alpherat, it will pass through Beta and Gamma, and farther on it will meet Alpha Persei. If these three stars be joined on to the square of Pegasus, it will be found that their combined form bears some resemblance to Charles's Wain in Ursa Major. Gamma Pegasi, or Algenib, is the south-eastern star of the square, and points to Jupiter, which is the most conspicuous object now visible. South-east of Andromeda, and about half-way between the zenith and horizon, Aries, the first of the zodiacal signs, can be identified by a group of tolerably bright stars, of which Alpha and Beta, near together, are the principal. Beta is the nearer of the two to the meridian. Pisces cannot boast of any star greater than the third and a half magnitude; but it extends, nevertheless, over a considerable portion of the heavens, from near Beta Andromedæ to below Markab, the south-westerly star in the square of Pegasus. In the diagram the general form of the constellation can be seen by a kind of curve of small stars in the direction just indicated. Cetus also spreads over a large part of the south-eastern sky, and its position is pointed out by several stars of the second and third magnitudes. Menkar, or Alpha Ceti, is in the E.S.E., at some distance below Aries, while Beta Ceti is in the S.S.E., below Jupiter. Sculptor is below Cetus near the meridian, and Eridanus occupies the south-east horizon. East of Aries and Cetus, Taurus, the second zodiacal sign, can be recognised by its bright star Aldebaran, between which and the zenith, the well-known group of the Pleiades can be seen. Aldebaran is out of the range of the diagram, but the Pleiades are inserted almost due east of the zenith at the left hand. The

eastern horizon is occupied by Orion, but the principal stars by which this constellation is generally distinguished are still below the horizon on September 15. The small constellation Triangulum is situated between Andromeda and Aries, its principal star being nearly midway between Alpha Arietis, and Beta Andromedæ. Near Triangulum, a small portion of Perseus is now included in the south map, but all its chief stars are still contained in the upper diagram. The Milky Way now passes through the zenith, from almost due east to west.

Capricornus, the Goat, joins Sagittarius, and is the fourth of the southern signs, and tenth in the order of the zodiac. It is also one of the old forty-eight asterisms, which tradition says were first placed in the heavens by the Egyptians, and afterwards adopted by the Greeks. Capricornus is bounded by Sagittarius on the west, Aquila on the north, Aquarius on the north-west and west, and Piscis Australis, and Microscopium on the south. Alpha and Beta Capricorni are the two chief stars in this constellation, but they are rather below the third magnitude. They are situated near together, south of the three principal stars in Aquila. Like Sagittarius, the old astrologers always looked with favourable eyes on Capricornus as a lucky sign; for "whoso es borne in Capcorn schal be ryche and wel lufyd." On this subject, the late Admiral Smyth has remarked that "although Capricornus is not a striking object, it has been the very pet of all constellations with astrologers, having been the fortunate sign under which Augustus and Vespasian were born, who thereby were entitled to the tutelage of Vesta; and this Sabæan superstition was honoured by medals, marbles, poems, and what not. It was not only of happy influence in classic times, but was also mightily looked to by the Arabians, who termed Alpha and Beta the lucky stars of the slaughterer, and Gamma and Delta the fortunate stars bringing good tidings." The position of Capricornus can be determined by drawing a line from Vega to the horizon, through Altair, when it will pass between Alpha and Beta Capricorni in the head of the Goat. These stars are now near the horizon in the south-west, but they are more favourably seen at midnight in the three preceding months. But this and all other constellations of low altitude, even when on the meridian, can never be of great popular interest in this country in comparison with those situated in more elevated positions.

Aquarius, the Water-bearer, is not a conspicuous constellation, having no star greater than the third magnitude. It contains, however, its full average of double-stars, clusters, and nebulae. Aquarius is the eleventh of the zodiacal signs, and is situated south of Equuleus and Pegasus, east of Capricornus and Aquila, north of Piscis Australis and Sculptor, and west of Pisces and Cetus. Aquarius was another favourite sign with the old astrologers, who declared that its stars possessed so much influence, virtue, and efficacy, that the seasons were affected by them "in a wonderful, strange, and secret manner;" and according to an old manuscript almanack for the year 1386, "it es gode to byg castellis, and to wed, and to lat blode" when the sun is in this sign. The principal object in Aquarius is Alpha Aquarii, or Sadalmelik, the king's lucky star. A line drawn from Alpherat to Markab, and then continued towards the south-west, will pass near Alpha Aquarii.

"From Scorpio, to where Aries shines, you catch no brilliant ray,
Through twice two interjacent signs, to mark your trackless way;
Yet would you know where, from his urn, Aquarius pours the stream,
From fair Andromeda descend, o'er Markab's friendly beam,

Or from bright Vega cast your glance, and through the Dolphin's space,
Then just as far again you'll find the Water-bearer's place."

Pegasus, the Winged Horse, is a prominent constellation on the meridian at midnight at this time of the year. It contains several stars of the third magnitude, in addition to Markab, Scheat, and Algenib, in the square, and according to Bode, 393 stars. It is bounded on the north by Lacerta and Andromeda, south by Aquarius, east by Pisces, and west by Equuleus and Delphinus. Alpha Pegasi, or Markab, is a white star of the second magnitude, at the junction of the animal's wing and shoulder, while Beta Pegasi, or Scheat, is a deep yellow star of the second magnitude in the left fore leg. Algenib, or Gamma Pegasi, is situated on the extremity of the horse's wing. Epsilon, in the mouth, and Zeta, in the neck, are two conspicuous stars west of Markab and above Aquarius. Eta Pegasi is near Beta, a little to the north-west.

Pegasus, and the adjoining constellations nearer the pole, owe their position in the heavens to a mythological connection. To assuage the anger of Neptune, Andromeda, the daughter of Cepheus and Cassiopeia, was bound to a rock to be devoured by a sea monster. At the moment when her death appeared inevitable, Perseus, who was returning through the air from the conquest of the Gorgons, changed the sea monster into a rock, by showing him Medusa's head, released Andromeda, and subsequently married her as a reward for his trouble. Pegasus is said to have sprung from the blood of Medusa, after Perseus had cut off her head. These five constellations, representing the names of the principal characters in this fable, now occupy a considerable portion of the sky both north and south of the zenith. Andromeda and Pegasus are south, Cepheus and Cassiopeia north, and Perseus west of that point. Equuleus, the Little Horse, is situated between Pegasus and Delphinus. The observer ought to have but little difficulty in recognising most of the principal stars in the district occupied by Pegasus, from the directions previously given; the following lines will, however, still further assist him:—

"And on, from where the pinioned maid
Her cruel fate attends,
Wide o'er the heavens his fabled form
Winged Pegasus extends.
From Alpherat down to Markab's beams
Let a cross-line be sent,
Then will four stars upon the horse
A spacious square present."

The sky north of the zenith now contains the two bright stars Vega and Capella on opposite sides of the meridian. Vega can be recognised on the left side of the upper map, and Capella in a corresponding position on the right side. Cassiopeia is approaching the upper meridian near the zenith, followed by Perseus, whose principal stars are still strictly in the northern half of the sky. Auriga is in the E.N.E. under Perseus, its position being indicated by Capella and Beta Aurigæ. In the same direction, Castor and Pollux are shining near the horizon. Castor just appears in the diagram, but Pollux is not yet within its limits. Between Capella and Polaris nearly the whole space is occupied by Camelopardus. This part of the heavens is devoid of large stars. Turning our attention to the constellations west of the meridian, bright objects down to the third magnitude are profusely scattered about in all directions, most of them belonging to important asterisms. Let us commence our survey with Cygnus, most of whose stars have passed since last month from the

southern to the northern map. Deneb, or Alpha Cygni, is near the upper part of the map, or almost due west in the heavens. In the W.N.W., Vega points out the position of Lyra, below which, towards the horizon, the stars generally belong to Hercules. Again, starting from the zenith, but this time towards the north-west, the constellation Cepheus fills up the space for more than thirty degrees. All its principal stars, and even its general shape, can be recognised with very little trouble. The reader is referred to the description of the August midnight sky for the relative positions of the different members. Cepheus separates Cassiopeia from Ursa Minor and Draco. Below Cepheus, all the stars in the central north-west sky are constituents of Draco, which extends from Lyra to the eastern side of Ursa Minor. Kocab and Gamma Ursæ Minoris, in the breast of the Lesser Bear, are N.N.W. of Polaris. These stars are sometimes termed the guards or wardens of the pole. A few stars in Boötes may be seen very near the horizon under Draco.

Ursa Major is in a very attractive position, although its altitude is low. It is now exhibited in the natural form of a waggon or plough, and all its stars can be viewed in great perfection when that part of the heavens is free from haze. Our imaginative conceptions of the form and arrangement of this celebrated collection of stars have been gathered chiefly when Ursa Major is at a comparatively low altitude in the north-west, north, or north-east. When this group of stars is on the upper meridian, it passes so nearly overhead that, in ordinary cases, they are not included in the field of vision without looking upwards to the zenith, an act which is seldom performed without a special effort. Dubhe and Merak, the Pointers, have passed the lower meridian from west to east at midnight on September 15, Gamma Ursæ Majoris is on the meridian, and Alkaid, or Benetnasch, which marks the end of the bear's tail, is still considerably west of that point.

Draco, the Dragon, is usually represented as surrounding the north pole of the ecliptic, its tail dividing the two Bears, while its head reaches to the right foot of Hercules. It was one of the original forty-eight constellations, and contains, according to Bode's Atlas, 255 stars. Alpha Draconis, or Thuban, was formerly recorded as the brightest star in Draco: it is now, however, only between the third and fourth magnitude. Upwards of 4600 years ago, this star was situated very near to the pole of the heavens. In the times of the Chaldeans, when the birth of astronomical science is supposed to have taken place, Alpha Draconis, being at that time so near to the celestial pole, must have appeared even more stationary than the pole-star of the present age. It has now deviated from that position nearly twenty-five degrees. Beta and Gamma, of the second magnitude, are the two brightest stars in Draco. The zenith-distance of Gamma Draconis is daily observed at Greenwich, if the weather be favourable, owing to its passing across the upper meridian nearly in the zenith of the Royal Observatory. From observations of this kind made with a peculiar instrument, a zenith sector, Dr. Bradley, formerly Astronomer Royal, made the important discovery of the aberration of light. The observations of this standard Greenwich star are continued from year to year with the object of obtaining fresh data for the re-determination, with the greatest attainable accuracy, of the value of this and other astronomical constants. The advantages arising from these zenithal observations are very great, for when objects culminate in that point, the effects of refraction pro-

duced by the earth's atmosphere are reduced to a minimum. We have previously remarked that the pole of the ecliptic is situated in Draco, and that the nearest star to it greater than the fourth magnitude is Zeta Draconis. Some conception of the general extent of this constellation can be gathered from the following lines:—

"A line from Dubhe, in the Bear, sent right the Guards between,
The stars which form the Dragon's tail in midway will be seen.
Far to the east the body winds, where Lyra's lustres glow,
A ray from Vega to the Pole its lozenge-head will show."

The diagrams of the midnight sky of September also represent the appearance of the heavens at 2 A.M. on August 15th, at 10 P.M. on October 15th, at 8 P.M. on November 15th, and at 6 P.M. on December 15th.

NAPIER OF MAGDALA.

Napier of Magdala

THE name of Napier has been so frequently connected with military and naval triumphs, from the time of the first Napoleon down to the present day, that it has almost become to English ears a guarantee for whatever success could be desired. The idea of failure has been never connected with it, because it could never be said that a Napier had failed in any undertaking fairly confided to his charge. The race of daring brothers and cousins descended from the man of Merchiston who framed the *canon mirabilis logarithmorum*—men who were as dauntless of soul as he was subtle in brain—have left, each of them, a name and a fame that are historical. They have scarcely sunk below the horizon when the famous name is wreathed with fresh laurels by another Napier.

Whoever has studied the history of British rule in India will have been tolerably familiar with the deeds of the Napier who was destined to be the conqueror of Abyssinia. As Brigadier, and afterwards as General Napier, he fought in all the fierce wars that were waged on Indian soil, from the outbreak of the first war in the Punjab, in 1845, down to the final suppression of the

terrible Sepoy Mutiny in 1858-9. Sir Robert has earned his honours by severe soldierly work. He had his horse killed under him at Moodkee, and was himself severely wounded at Ferozeshah. He fought at Sobraon and Lahore; conducted the siege of the fortress of Kangra; and was chief engineer at Mooltan, where again he was seriously wounded. He commanded the scientific corps of the right wing at Goojerat; and he was with Sir Walter Gilbert in that famous pursuit of the Affghans across the territory of the Punjab to the gorges of the Khyber Pass. Subsequently, under Lord Dalhousie, he carried out, as chief engineer, various important works in the conquered province, and reduced the predatory hordes of the Suleiman and the Black Mountains to submission. During the mutiny of the Sepoy army, as chief of Sir James Outram's staff, he took part in the battles round Lucknow; he commanded a column in the rescue of the siege train at Charbagh; he rendered ready and most important service at Gwalior; at Jowra Alipore he dashed with the suddenness of a tempest on a body of rebels ten times as numerous as his own troops, and drove them in panic rout. In

August, 1858, he surprised Mann Singh in Paoree, stormed the place with shot and shell, put the rebels to flight, razed their stronghold to the ground, and after a brief rest was again in pursuit of their scattered bands. In the campaign in China, memorable for the disastrous loss of the British in the attack on the Taku forts, and which ended in the capture of Peking, General Napier served with his characteristic energy and vigour. Twice during his career of warfare in the East he earned the thanks of Parliament for his brilliant services.

When all peaceful attempts to recover our fellow-subjects held in captivity by King Theodore of Abyssinia had proved vain, and it became necessary to have recourse to arms for their deliverance, an expedition was determined on, and Sir Robert appointed commander-in-chief. Never, perhaps, was an expedition inaugurated under more lugubrious forebodings—never, certainly, has any warlike enterprise been concluded with a success so complete and satisfactory. Difficulties of so formidable a kind, it was said, would have to be encountered, that it were almost hopeless to expect to surmount them. The route of the advancing army would lie through a savage country practically inaccessible to numbers—the natives would rise against them and bar their progress—famine would mow them down, and pestilence dog their steps—and the tropical monsoons would overtake them before their work was half done; and they would disastrously succumb to the manifold obstacles that lay in their path. It is perfectly true that great difficulties had to be encountered, though they were not precisely of the kind which the croakers insisted on. What they were likely to be, Sir Robert, from his long Indian experience, extending over some quarter of a century, was exceedingly well qualified to judge, and he took the necessary precautions against them. People at home could not understand the real drift of the prudential measures he adopted; and it is amusing, now that all is done, to review the criticisms of the press as they were promulgated from time to time while the expedition was in its earlier stages. By degrees the prudence and foresight of the commander began to be recognised. It was seen that he was fully prepared for all emergencies. The natives, who were to have barred his way by their hostility, were transformed into friends and allies, because they were made to understand, by the magic of cash payments for everything, that it was to their interest to aid and not to hinder the advance of the British force. So thoroughly was the native mind subdued to this conviction, that the cardinal difficulty of the enterprise—the difficulty of the journey—was solved more by their assistance than by any other means. The four hundred miles of savage and mountainous wilds which lay between Magdala and the coast were bridged over by the good feeling engendered by ready-money and fair dealing, which made the whole line of march a profitable market for the native produces. The maxim that “honesty is the best policy” has rarely been illustrated in so forcible a manner, and the policy of honesty never produced more welcome results. The hardships of the route were endured with exemplary fortitude by the entire army; amidst excessive labours and fatigue, alternating with privations of a most trying kind, they pressed steadily forward. Had their advance been opposed by the forces of the chiefs whose districts they traversed, who can tell what the result might have been?

We may imagine the surprise of the cruel tyrant when, on that 10th day of April, the blow was struck which at once annihilated his sovereignty and taught

him what was the true strength of the distant island people whom he had insulted, and whose fellow-countrymen he had held in chains. But we need not dwell on that brief battle, where he saw his best and bravest mown down “like grass beneath the scythe”—nor on the events which so rapidly followed—the surrender of the captives, the storming of Magdala, and the death of the tyrant at the downfall of his rocky fortress. These events are too fresh in the memories of our readers to need recapitulation.

The object of the expedition being accomplished by the rescue of the captives and the destruction of Magdala, the invading host, without an hour of avoidable delay, retraced its steps, once more to contend with the difficulties and hardships of that weary route. After the success of their united endeavours, Sir Robert issued a manifesto to his troops characterised as much by its frank generosity as by its terseness and point. A brief extract from this document, will not be out of place:—

“Soldiers of the Army of Abyssinia,—The Queen and the people of England intrusted to you a very arduous and difficult expedition—to release our countrymen from a long and painful captivity, and to vindicate the honour of our country, which had been outraged by Theodore, King of Abyssinia. I congratulate you with all my heart on the noble way in which you have fulfilled the commands of our sovereign You have released not only the British captives, but those of other friendly nations. You have unloosed the chains of more than ninety of the principal chiefs of Abyssinia. Magdala, on which so many victims have been slaughtered, has been committed to the flames, and remains only a scorched rock. Our complete and rapid success is due, first, to the mercy of God, whose hand, I feel assured, has been over us in a just cause; secondly, to the high spirit with which you have been inspired. The remembrance of your privations will pass away quickly, but your gallant exploit will live in history. The Queen and the people of England will appreciate your services. On my part, as your commander, I thank you for your devotion to your duty and the good discipline you have maintained. Not a single complaint has been made against a soldier, of fields injured or villages wilfully molested in property or person. I shall watch over your safety to the moment of your re-embarkation, and to the end of my life remember with pride that I have commanded you.”

Falsifying all the gloomy predictions of the croakers, the expedition returned to the coast without loss, and thence re-embarked—leaving behind them only the remembrance of their stern deed, a lesson of retribution intelligible to other savage despots, and a memorial of the power of Britain to protect her sons and avenge their wrongs.

The conqueror of Abyssinia arrived in England at the end of June, and on the 3rd of July the thanks of both Houses of Parliament were, for the third time, awarded him. We shall quote only a few words from the speech of Mr. Gladstone, the leader of the Opposition, expressing the general feeling of the country. Mr. Gladstone said, “While we readily acknowledge that all have well done their part from first to last, it is impossible not to dwell upon the character of the man whose name first appears in the motion; without him it might have been possible that great things might have been achieved, but there has been a completeness in the work performed which we cannot do otherwise than connect in a special manner with the special qualifications of his mind and

capacity. Without him we scarcely could have hoped that this expedition would stand upon record as a rare example among those occasions when a nation resorts to the bloody arbitrament of war, of an occasion upon which not one drop has been added to the cup of human suffering that any forethought or humanity could have spared, and on which the severest critic, when he reviews the proceedings, will find nothing from first to last to except to, whether it be with respect to their military or political or moral aspect. No man can read the despatches of Sir R. Napier without seeing that, after we have given to him the praise of a commander apparently consummate in his means of meeting every demand that has been made upon him for military qualities, there is something which remains behind—that there is a mind firm of purpose, never losing for one moment its thorough balance, and amid all anxiety and excitement, keeping the eye steadily fixed upon moral aims, and remembering under all circumstances the duty of keeping and maintaining untainted and in virgin purity and honour the character of this country. Nor can any one become acquainted with Sir Robert Napier—as we must all feel that we are acquainted with him after we have read his interesting, his manly, his simple, and his modest account—without being conscious that we depart from the consideration of this subject not only with gratitude and admiration for the general, but with respect, with regard—I would almost say with affection—for the man.”

According to precedent in such cases, the thanks and encomiums of Lords and Commons are accompanied by a substantial token of the gratitude of the country. Sir Robert, raised to the peerage, will take rank with the first of his name and lineage, and will enjoy an accession of wealth honourably won. He has also received the freedom of the City of London, accompanied with a sword of the value of two hundred guineas. The page which tells his story to future times will exhibit a new phase in the history of war, inasmuch as it will treat of a dangerous enterprise on a costly scale prompted by humanity alone, and untarnished in its execution by a single act of cruelty or oppression. “A victory is twicet itself,” says Shakespeare, “when the achiever brings home full numbers.” Never has so valuable a triumph been gained at so small a cost of life as the triumph at Magdala; it has been well termed a tearless triumph,—seeing that the “achiever” brought away the whole of his force with their numbers all but undiminished.

Our portrait is from a photograph given by the General himself to an Indian friend, and the autograph is copied from his first signature as a British peer.

MY FIRST CURACY.

CHAPTER VII.—PAROCHIAL VISITS.

PERHAPS it is among the most difficult matters in a clergyman's administering rightly and profitably to the wants of his people, to know when to make his parochial visits.

Of course there are general rules which are always observed. To go at once when sent for, especially in sickness, is an obvious duty. But I refer to ordinary visitation. Here also some rules may be given, as, for instance, the avoidance of the dinner-hour, washing and rent days, or when their relations have arrived on a hasty visit, or other equally ill-timed seasons.

On the other hand, it is not politic to make our parochial visits on certain fixed days, at settled hours, always on the same people. I have had experience in these things. I bought my experience, and I paid rather

dearly for it too. The only occasions when pre-arranged times are necessary, are when groups of neighbours are invited to meet in one place. This system of visiting is now much carried out, under the name of “cottage meetings.” By catechising the children, and by various devices, these meetings may be made very profitable, both to young and old.

I think that the most convenient time in which to call upon farmers and tradespeople is invariably in the afternoon. And this period of the day generally suits most people, whether clergy or laity; the parishioners will have more leisure time to attend to your remarks, and be most likely in a better temper, after the earlier business part of the day has passed away. Moreover, it is a well-known rule among clergymen, never to ask for a donation, if possible, until after your expected benefactor has dined.

I think, however, that schools are best attended to in the morning; both master, children, and yourself, are fresher, and the boys and girls are more likely to give heed to what you teach them, than if you had stepped into the school during the last half-hour of the afternoon's work; but with visiting, and especially with the sick, the afternoon is, from my experience, the best time for parochial visits. When I entered into the ministry, an old clergyman put me upon my guard about laying too much stress on the arrangements of the room, the laying out of the family Bible, the tract you lent last carefully put by its side, the spectacles also, and I found that this caution was necessary.

I will give an instance or two in illustration. The event occurred in my first curacy, and I have since met with many similar cases.

I was called upon to visit and relieve an old woman, who was reported as being dangerously ill. I made no delay, but hastily told the messenger that I should be at the house in the course of an hour; accordingly, upon my arrival, I found that I was expected, and was shown up at once into the patient's room. I found the sick woman cleanly dressed, and prepared to receive me; she was engaged in diligently reading her Bible, and several other devotional books and religious publications lay scattered around her on the bed.

With this visit I was rather pleased; in the first place, I was exceedingly glad to find the old lady so happily employed in what she took great pains to impress upon me was her greatest delight in life.

After a few general observations upon sickness, its trials and its blessings, and brief prayer, I left, promising to call again in the course of a couple of days.

This I did, and again I found the woman similarly engaged in reading her Bible; but upon my making a pointed remark or two upon the holiness of daily life required in us by God, I was rather shocked by the replies she made, and perhaps more so by the tone in which she uttered the words, than by the words themselves; she plainly told me that she was very sure of going to heaven, and that I need not trouble about the safety of her soul.

The next visit I paid was quite unexpected either by mother or daughter, so much so, that the latter, with whom the old woman lived, rushed up-stairs as I approached the door, evidently to tell her mother of my arrival.

My knock was quite unheeded, though the door was standing open, and the sound could be most distinctly heard up-stairs. I heard a good deal of tramping about overhead, and presently, in answer to my repeated knocks, the daughter came smiling down the stairs, but looking slightly flurried.

I took no notice, but proceeded at once to the sick room; as I entered, the old woman gave a perfectly theatrical start, exclaiming, "I was so deeply interested in this blessed book, that I did not hear you enter."

Now I felt instantly that this was a most barefaced lie, for the daughter had certainly seen me approaching the door, so without making further reply, I went swiftly to the bedside, and took the Bible from her hands and said, as I did so, "Let me see in what you are so very deeply interested."

She was evidently wholly unprepared for my manœuvre, from the painful result of my action. I very gravely said, "You are indeed a clever woman to read your Bible upside down," as was the fact.

Of course she was utterly confused.

I felt so much disgust, that I left the room and the house without saying another word; as I passed I could not help noticing, in my hurried exit, the haphazard way in which the numerous tracts, evidently kept for the purpose, had been profusely scattered over the bed by the daughter the moment before I was allowed to enter; and, without the least doubt, the Bible also had hastily been thrust into the sick woman's hand, only unluckily this time the wrong side upwards. I regret to add that this old woman actually died on the following day.

This true anecdote is very shocking, very repulsive, and very hardening. I had gone away from my first few visits rejoicing at finding apparently such a good Christian woman, and yet how painfully and rudely had I been wakened from my dream.

These things seldom happen singly, for take another case, which very shortly afterwards came under my notice. I was in the habit of visiting an old woman suffering most dreadfully from ulcerated legs. The pain she constantly endured really made her a true object of pity. Old as she was, and she was turned seventy-seven, she could see to read pretty well, and was better educated than most of her neighbours in her own standing of life. But I fear, from her subsequent conduct, her only religion consisted in the fact upon which she prided herself, namely, that she had "kept her church," that is, attended pretty regularly when well the services of the church on the Sunday afternoon. This woman, whom I will call Nancy White, lived in a small house with only one window down-stairs and one entrance. I am particular as to these details, because they are necessary to the understanding of the incident I am relating. A person wishing to call upon her was obliged to pass close under the sitting-room window, and then to turn down a passage, before the door of her room could be reached.

Now, as I was passing along one day, I saw Nancy White standing up before the window busily engaged in ironing some articles placed on a table before her (I ought to say that this was not the hour in which I usually paid my parochial visits). Being rejoiced at such an improvement in Nancy's health as to allow her to carry on such a useful occupation, I went up the passage, on purpose to congratulate her.

When I reached the door, I knocked, as is my unvarying custom when I make parochial visits, as also to take off my hat before entering. I have known the observance of these little civilities win the hearts of the people, and the breach of them do just the reverse. Upon receiving the customary "Come in," I did as I was bid and entered, when, to my perfect astonishment, there sat Nancy, some way removed from the table, intently reading a book I had lent her, and rubbing, meanwhile, her sore legs as if that was her sole business in life.

All the ironing things had been hastily thrown into a corner and covered with a cloth, so that not a vestige of wet linen remained visible to tell a tale.

Now, as there was no other window, and the road by which I had come was close under the casement, and commanded a good view of the room and its contents, and no door by which a person could escape unseen by myself, I was quite certain that Nancy had been the only occupant of the room, and that I had not been mistaken in my recognition of herself.

This was a sad case of hypocrisy, but I could, I am sorry to add, relate several more, similar in many respects to the two I have already mentioned; but I have merely selected them as true specimens of the deceit practised upon us in making our parochial visits among the poorer classes, teaching us that we should not trust too much in these matters to outward appearances only.

I have found from experience that a clergyman of a parish, if indeed he would truly know the real character of the people entrusted to his charge, should go out at all hours among them; although it is painful that practically he should thus become a policeman in plain clothes.

The unmasking of these deceitful actions is a very disheartening, but, I am convinced, a necessary work; for their success, of course, finds imitators on the one hand, and on the other, honest, striving, painstaking poor, who are above such deceit, are rendered discontented and often soured by the passing over unrelieved of their needs and wants, which sometimes are greater than those of the successful hypocrite.

Of course these actions are to be most strongly reprehended; but I know that the clergy and district visitors generally have brought this state of things upon themselves in a great degree. And this, by relieving the temporal wants of the sick and poor, at the same time that they have called with the object of making a visit upon spiritual matters. The patient is quite aware of this, and consequently wishes to appear as good as possible, in order to obtain the expected shilling or half-crown.

Now when it can be done without great inconvenience, the two objects of temporal and spiritual relief in a visit to a sick person should be kept perfectly distinct; seldom or never, in my opinion, should the relieving of the body be coupled with the ministering to the soul.

It is certainly a very pressing temptation to a sick person, entirely subsisting upon parish allowance, to shake his head solemnly and to turn up his eyes heavenward, when he really feels no true emotion, if he expects thereby at the close of your visit that you will the more freely open your purse.

I think that parochial visits to the poorer classes are much more easily made than those paid to the well-to-do tradesman or farmer. It is so difficult a matter in these latter cases, not to allow the time of one's visit to be frittered away in useless commonplaces, which will serve only to lower the clergyman in the estimation of the persons upon whom he is calling; though at the particular moment they may consider him a pleasant companion, and his visit an agreeable relaxation from the routine of daily life.

I shall not pretend to lay down rules for such visits as these; I know they are the most difficult to render profitable which occur in our ministrations. I only remark that too much watchfulness cannot be observed, lest, in accepting these hospitalities, we should be tempted to forget that we are the messengers of Christ, and ministers of the Gospel.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Couper.*

TAMATAVE HARBOUR, MADAGASCAR.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XII.

I BEGAN seriously to fear that we were getting the worst of it. Shot after shot came crashing on board, and several more men were brought down. I expressed my fears aloud to the surgeon. A poor fellow already on the table about to undergo amputation overheard me. "Don't think of that sir," he exclaimed, "they are tough ones, those mounseers, but we'll go down with our colours flying sooner than strike them."

At that instant our ears were saluted by loud

cheers, which burst from the crew on deck. Still the firing was kept up, and it was evident that our ship continued in action. At last, another wounded man being brought down, we heard that the *Renommé*, the French commodore's frigate, had struck.

In a few minutes another cheer was heard, the firing ceased, and we had the satisfaction of finding that the *Clorinde* had also struck her colours to us. My heart felt intense relief when I found that the action was over, and that my young brother had escaped without a wound. Then I recollected that those who had been killed had not been brought below. I wondered that he

had not come below to relieve my anxiety. Those of whom I inquired could not tell me what officers had been killed. The instant, therefore, I could leave the poor suffering fellows I had undertaken to assist, I hurried on deck. When I went below the frigate had presented a trim and orderly appearance. Now her sails were torn and full of shot-holes, her running rigging hung in loose festoons, with blocks swaying here and there, her bulwarks were shattered, her lately clean deck ploughed up with round shot covered with blood and gore, and blackened by powder. The thickening shades of evening threw a peculiar gloom over the whole scene. I looked anxiously round for William. I could not see him. My heart sunk within me. Could he be among the slain? A midshipman hurried past me.

"Where is Braithwaite, my brother?" I asked, in a trembling voice.

"There, don't you see him on the fore-castle?"

I looked in the direction to which he pointed. My heart bounded up again as I saw him directing the men engaged in bending a fresh foresail, which had before concealed him from my sight. My voice trembled with emotion as I ran forward, and shaking him by the hand congratulated him on our victory and his safety. He seemed scarcely to understand my agitation.

"Yes, I am thankful to say we have thrashed the enemy, and I wish there were a few more to treat in the same way. There is one fellow making off, and I am afraid the *Astrea* will not be able to work up to bring her to action."

I looked out as he spoke. One of our frigates, to which he pointed, was a long way to leeward, while a French frigate was standing under all sail to the north-west. Our two antagonists appeared fearfully shattered, both the French commodore's ship and the *Clorinde*, which was even in a worse condition than we were. All our boats had been so injured by shot, that we were unable to send one to take possession of our prize, and as the night was now rapidly coming on, we could not hope to do much to repair damages till the morning. As long, however, as the men could work, the carpenter's crew continued putting the ship to rights. The rest of the already overworked crew were then piped below, that they might be able to renew their labours on the morrow. I had plenty to do in assisting the surgeons in attending on the wounded, till at last, well wearied out, I turned into my hammock, thankful that my dear brother and I had escaped the perils of the fight, and sincerely hoping that, as it was my first battle, so it might be the last in which I should be engaged. Before going below I took a look towards our prize, whose light I saw burning brightly at no great distance from us. I had now time to think of my own affairs, and of course was not a little anxious about the fate of the *Barbara*, for it was too probable that she had fallen into the hands of the Frenchmen. If so, they would probably have sent her to France, as she was well provisioned for a long voyage, or to one of their settlements, where she could be disposed of to advantage. My sleep was sadly disturbed with these thoughts and with the scenes of pain and suffering I had witnessed. I awoke soon after it was light, and dressing quickly, went on deck. It was to find everybody there in a state of no small anger and vexation.

"She is off, gone clean out of sight," I heard people saying.

I inquired what was the matter.

"Why it is enough to vex a man, Mr. Braithwaite," observed the first lieutenant; "as we could not send on board last night to take possession of our prize, she

has managed to slip away during the darkness. She left a light burning astern on a cask to deceive us. If we ever come up with her we'll make her pay dearly. The other fellow, too, has got clear away; however, we will find him out, wherever he has hid himself."

Soon after this the commodore signalled to us to send our boats to assist in removing the prisoners from the *Renommé*. Thanks to the exertions of the carpenter and his crew, three were already made capable of floating. I asked to take an oar, as I wished to go on board the prize. No sooner did I step on board than I regretted having come. Terrible was the scene of slaughter I witnessed. The frigate had been crowded with troops, nearly one-half of whom had been cut down by the *Galatea's* shot which she had poured into the Frenchman's hull. The crew were only now beginning to throw the dead bodies of their shipmates overboard. The French commodore, a gallant officer, and many others, were killed. But the wounded nearly doubled the killed, and they chiefly excited our sympathy. Their own surgeons were already almost worn out with attending to them, and of course we could not spare any of ours to render them assistance. The more of the effects of war I saw, even on this small scale, the more I longed for the time when wars are to cease and nations to live at peace with each other. It was not, however, the fashion to speak on that subject in those days, nor do the nations of the world, alas! appear more inclined now than then to bring about that happy state of things.

When taking some of the prisoners on board the *Galatea*, I found she also had suffered severely, though not at all in proportion to the *Renommé*. Captain Schomberg ordered us, as soon as our damages were repaired, to make sail for the port of Tamatave, on the east coast of Madagascar, where he suspected the other French frigate had taken refuge, her captain supposing probably that we should return at once with our prizes to the Mauritius. The *Astrea* coming up, her crew went on board the *Renommé*, to put her to rights, and this being done, all four frigates made sail together for Tamatave. It is merely a reef-formed harbour, and by no means a secure or good one. The English had sent a force of about fifty men there after the reduction of the Mauritius, and they had, we understood, built a fort, or taken possession of an old one. It was a question whether they had been able to hold it against the French, or had been compelled to surrender. As we approached the coast, all our glasses were in requisition, to ascertain whether any ships were at anchor off the place. There were two, certainly, one larger than the other. The wind was light, but we at length got in close enough to see that the French flag flew at their mastheads, as also over the fort, and that there were several smaller vessels. I thought that there would be more fighting, but instead of proceeding to that extremity, the commodore sent in a boat with a flag of truce, pointing out the overpowering force he had under him, and demanding the instant surrender of the ships and fort.

We anxiously watched for the return of the boat, for if the demand was not acceded to, we should have, it was understood, to go in and cut out the ships with our boats. Many liked the thought of such an exploit, in spite of its dangerous character. It was very possible that the French captain might hope, with the support of the fort, to be able to beat off the boats, and to hold out until the squadron should be driven off by a storm. At last the boat was seen returning. The frigate was the one which had escaped from us. Her captain wisely agreed to yield to the fortune of war, and to give her up with all her prizes, and the fort into the bargain.

"And what is the name of the other ship?" I asked.

"The *Barbara* merchantman," answered the lieutenant. "She was on the point of sailing with a French crew when we appeared, so that her owners have had a narrow chance of losing their property."

This was, indeed, satisfactory news. I was, of course, very eager to go on board and hear from Captain Hassall what he intended doing. The account brought off as to the state of the English garrison was melancholy. The fort was built in an especially unhealthy spot, with marshy undrained land close round it. The consequence was, that of the fifty men who had been sent there, when the French appeared not a dozen were alive, and that sad remainder were scarcely able to lift their muskets. They had therefore at once yielded to the enemy. Several others had since died, but the sickly season being now over, it was hoped that the remainder would live on till the next year, when, in all probability, during the same season they would share the fate of their comrades. I got a passage in one of the next boats which pulled in. Captain Hassall had been allowed by the French to return to his ship, and he was taking a turn on deck when I went alongside. He looked at me curiously two or three times when I stepped on deck, and raising his hat, inquired what I wanted. Suddenly he stopped when he got close up to me, exclaiming, "What! James Braithwaite, my dear boy, is it really you? I am delighted to see you, for, to say the truth, I had given you up as lost. I never supposed that cockle-shell of a boat in which you left the ship would have survived the hurricane which came on directly afterwards."

There was one question above all others I wished to ask him, "Have you written home to tell my friends of my loss?"

"No," he answered; "I have so often found people turn up whom I thought had been lost, that I am very unwilling to send home bad news till it is absolutely necessary, and as I did not require your signature, I was able to avoid mentioning that you were not on board."

This answer greatly relieved my mind, and I was in a short time able to talk over our arrangements for the future. The capture of the *Barbara* would, of course, be a heavy expense to the owners; but if the voyage should prove as successful as we still hoped it might be, a handsome profit might yet be realised. To that object we had now to bend all our energies. We were therefore anxious as soon as we could to proceed on our voyage. I had heard from the captain of the *Phoebe* that an expedition was fitting out in India for the capture of Batavia, the chief town in Java, of which the French now held possession; and we had great hopes, if we could reach it soon after the English had gained the place, which of course we expected they would do, that we should sell a large portion of our cargo to great advantage. Before sailing, however, we determined to see what trade could be carried on with the natives. Fortunately, the French had not touched our cargo for that purpose. Though they have made frequent attempts to form settlements in Madagascar, they have never succeeded in gaining the confidence and goodwill of the natives. Had the plans of the Count Benyowsky been carried out when he offered his services to France, they might possibly have obtained a powerful influence in the affairs of the country, if not entire possession of it. His plans were, however, completely defeated by the governor of the Mauritius, who, looking on Madagascar as a dependency of that island, was jealous of his—the Count's—proceedings, and finally drove him to make

common cause with the native against the French Government. I heard some details of the life of that extraordinary adventurer. The Count Benyowsky was a Polish nobleman, who for some political reason was banished by the Russian Government to one of its settlements in the extreme eastern part of Siberia, whence it seemed impossible for him ever to find his way back to Europe. The governor of the town in which the Count was compelled to reside had a daughter, young and lovely, who had conceived a warm affection for him, which appears to have been fully returned. Through the means of this young lady he was able to gain information as to everything which was taking place. He heard, among other things, that two large Russian ships were expected at the neighbouring port. He had long been looking out for the means of making his escape from Siberia. Here was an opportunity. None but a man of great boldness and energy would, however, have considered it one. He was a prisoner in a fortified town. It contained a considerable number of his countrymen, but they were prisoners strictly watched. Still he was determined to make the attempt. He set to work and gained over a hundred men to assist in his dangerous undertaking. By some means they were able to provide themselves with arms. The governor's fair daughter undertook to obtain the keys of the fortress, provided her father's life was spared. The adventurers found it impossible to make their escape without first mastering the garrison. The conspirators were mustered, and were ready for the enterprise. The young lady brought her lover the keys. Her last words were, "Do not injure my father."

"Of course not, if he makes no resistance," was the Count's answer.

The gates were opened, the conspirators rushed in. The old governor was, however, not a man to yield without a struggle. Putting himself at the head of some of his men, he endeavoured to keep back the assailants. Again and again he charged them, calling on the troops to rally round him. It was evident to the Count and his companions that, if he was allowed to live, their undertaking would fail. He, therefore, pressed on by numbers, was killed, with all who stood by him.

The adventurers now putting all who opposed them to the sword, became complete masters of the place, and without difficulty obtained possession also of the two ships which had just arrived. A sufficient number of officers and seamen were found to navigate the ships, and having provisioned them for a long voyage, the Count, taking the daughter of the governor with him, went on board them, with a hundred companions, and made sail to the southward. The Count had taken precautions against pursuit: indeed, there were probably no Russian men-of-war in those waters at the time, and thus he made good his escape. He touched at a variety of places. He reached Canton in safety. Here he wisely sold his ships, as, had he fallen in with any Russian men-of-war, his destruction would have been certain. At Canton he and his companions embarked on board two French vessels, in which they proceeded to the Isle of France. Here he announced his intention of forming a colony in Madagascar, or perhaps of conquering the country for France. His plans, as I have said, excited the jealousy of the governor of the Mauritius, and of other people of authority in that island, who determined to oppose him. Notwithstanding, he proceeded to France, where he so completely gained the good opinion of the French minister, that he was appointed to take command of an expedition to found the proposed settlement,

with the title of governor-general. He had married the daughter of the Russian governor, and she accompanied him in all his travels, but what was her ultimate fate I do not remember having heard. After returning to the Isle of France, where the governor still kept up his hostility and opposed him by every means in his power, he set sail with about three hundred men for Madagascar. He landed at Antongil Bay, where he was well received by the chiefs, but he at first was subject to a good deal of opposition from the natives generally. He did his best to conciliate them, but as he had often to employ force, and to keep up a strict military rule at the same time, it must have been difficult to persuade them that his intentions were pacific and philanthropic. He seems to have met with heroic courage all the innumerable difficulties by which he was beset. He lost many of his officers and men by sickness, as the position where he attempted to found his first settlement, from being surrounded by marshes, was very unhealthy. Among others, his only boy lost his life by fever. He was left without the necessary supplies he expected from the Isle of France, the governor purposely neglecting to send them. The natives also were incited by emissaries of the governor to oppose him, while of the officers sent to him, some were incapable, and others came with the express purpose of betraying him. Notwithstanding all these difficulties, by the middle of 1775 the settlers had built a fort in a more healthy situation, which was called Fort Louis, had constructed all the necessary buildings for the town of Louisbourg, and had formed a road twenty-one miles in length, and twenty-four feet in breadth. The Count had also done something towards civilising the people, and among other important measures had persuaded the women to give up their practice of infanticide, which had been terribly prevalent. They, however, refused to ratify the engagement without the presence of the Count's wife, who was residing at the Isle of France. She was accordingly sent for, and on her arrival, the women of the different provinces, assembling before her, bound themselves by an oath never to sacrifice any of their children. They agreed that any who should break this oath should be made slaves, while they were to send all deformed children to an institution which had been founded by the Count in the settlement for that purpose. He had by this time formed alliances with many of the surrounding chiefs, who ever afterwards remained faithful to him. In other parts of the island combinations were formed against him. He accordingly mustered his forces, and marching against his enemies, who had brought forty thousand men into the field, put them to flight. Those who fell into his hands he treated with so much leniency and kindness, that he ultimately attached them to his cause. A curious superstition of the natives was the cause of his being at length raised to the dignity of the principal chief of the island. It appears that the hereditary successor to the title was missing, when some of the natives took it into their heads that the Count Benyowsky was the lost heir. The idea gained ground, at the very time that the affairs of the Count were in a very precarious condition. His own health was failing, the more faithful among his European officers were dead, his enemies in the Mauritius had succeeded in prejudicing the minds of the members of the French Government against him, and two if not more vessels bringing out supplies had been lost. Under these circumstances, it is not surprising that he should have accepted the proffered dignity, which shortly led to his being recognised as the principal chief and supreme ruler of the whole island.

Commissioners had been sent out from France

to investigate the affairs of the settlement. While they were there he took the opportunity of giving up the command of the settlement to another officer, and entirely dissolved his connection with it and with France, though he at the same time, with the other chiefs, expressed his desire to live on friendly terms with the inhabitants, and to support the settlement to the best of his ability. He employed some time after this in consolidating his power and in improving the condition of the people. He also drew up a constitution which for those days was of the most liberal character. Having done all he could to civilise the people, he resolved to go to Europe to establish mercantile relations with different countries for the improvement of the commerce of his adopted country.

In France, though he had some friends who welcomed him cordially, he was coldly received by those in power, though his course was supported by the celebrated Dr. Franklin, who was at that time in Paris. At length quitting the country, he went to England; but though he offered to place the country under the protection of the English Government, no encouragement was afforded him. All his hopes in Europe having failed, he set sail for the United States, in a vessel he chartered with a cargo of goods suited to the markets of Madagascar. After remaining for some time in the United States and obtaining another ship and cargo, he reached Antongil Bay in July, 1785. He was here cordially welcomed by the chiefs, but instead of going into the interior and assuming the reins of government, he remained on the coast, for the purpose of establishing trading-posts where his goods might be disposed of. He had captured one port from the French, and was engaged in repairing a fort built by them, when a body of troops landing from a French frigate attacked him. He retired with some few Europeans and natives into the fort, where he attempted to defend himself. The French advanced, he was shot through the body, and being ignominiously dragged out, directly afterwards expired. Poor Count Benyowsky! I could not help feeling sorrow when I heard of his sad fate.

The climate of the low lands near the seashore was, from what we heard, very unhealthy, but in the hill country of the interior it is as healthy as any part of the world. We heard a good deal of the English and French pirates, who had formed, a century before, some flourishing settlements on the northern coasts. The name of a bay we visited (Antongil) was derived from one of the most celebrated, Anthony Gill. Several other places also obtained their names from members of the fraternity of freebooters. While the pirates continued their depredations on the ocean, they in general behaved well to the natives, but when being hotly pressed by the men-of-war of the people they had been accustomed to rob, they entered upon the most nefarious of all traffics, that of slaves, and to obtain them instigated the people of one tribe to make war on those of another. This traffic has ever since been carried on, greatly contributing to retard the progress of civilisation.

VILLAGE CLUBS AND READING-ROOMS.

For comparison with other similar institutions, we give the following statement from the Rev. Dr. Tristram, of Greatham, Stockton-on-Tees:—

"Several of the working men in my parish seeing the evils inseparably connected with public-house clubs, of which there are three in this village, resolved to

form themselves into a sick club, the fundamental rule of which should be that the meeting should not be held at a public-house. The movement was spontaneous on their part, and originated several years before I entered upon the charge of the parish. The only extraneous assistance they receive is the use of the boys' school-room for their meetings, the kind co-operation of the schoolmaster as their accountant, and the proceeds of an annual lecture given by myself or some other friend. The subscription is 1s. 3d. per month for the sick fund, 3d. for the medical officer, and 1s. for each funeral of a member, or 6d. for the funeral of a member's child. The benefits are—an allowance of 7s. per week in sickness, medical attendance for cash subscribing members, £4 for the funeral of a member, £3 for that of his wife, and 30s. for the funeral of a member's child. The club is more than self-supporting, and a larger sum has been funded than has been received from all the donations and lectures since the commencement.

"Our Parochial Institute and Working Men's Club is not six years old, but is self-supporting. It consists of a reading-room and library, with conveniences for letter-writing (a most useful accommodation for a working man), a smoking and conversation room, well supplied with draught and chess boards, dominoes, etc., and a quoit-ground behind. With a population of seven hundred we suffer from the diversified attraction of seven public-houses, more than sufficient to demoralise the place. It was our object to make the institute a successful counter attraction, and though it has not reclaimed many of the confirmed sots (though even here it has been by no means without results), yet it has withdrawn from the public-house many young men who were beginning to resort to them, and has become decidedly a popular institution. After working hours both rooms, especially on washing nights, are crowded, and every newspaper and draught-board occupied.

"We raised nearly £20 for furniture and outfit, and do not scruple to solicit contributions for our library, consisting already of about 300 volumes, many of them costly works; but for our current expenditure—rent, lights, papers, etc.—we rely entirely upon the members' subscriptions. The subscription is 1s. 6d. per quarter, and we have three daily and six weekly papers. The average number of members is fifty. Last year our ordinary receipts were £14 4s. 4d.

EXPENDITURE.

	£	s.	d.
Rent and Taxes	5	13	6
Attendance	2	12	0
Coals and firing	2	5	8
Oil	2	8	4
Newspapers (less sales)	3	17	1
	£16	16	7

"Our extraordinary receipts were £16 1s. 6d., arising from profits of lectures, donations, and the surplus from the dinner tickets; and of this £12 was available for the purchase of books for the library, after defraying the deficit on the subscription account.

"Our annual new year's supper has proved a most valuable cement in binding together the members. Each pays 1s. 6d., and, as many farmers and other friends contribute a piece of beef, a hare, a gallon of beer, or some such substantial assistance to the feast, there is a large cash balance to carry to the credit of our funds. The institute is managed by an elected

committee, but the property is vested in the vicar and churchwardens."

The Greatham Club is a fair representative of a well-managed institution on a small scale. In many rural districts an immense benefit would be conferred on the working classes by the establishment of similar clubs, independent of the influence of publicans and other interested persons.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

JOHN GIBSON LOCKHART.

I AM much gratified by having it in my power to leave a brief tribute to the memory of John Gibson Lockhart. As far as I am aware, from the reading of contemporary publications of fifty years, even to the present day, few characters have ever been less understood or more misrepresented. But mine is a simple statement: neither an apology nor a defence, and the leading facts in the story of his life will best serve my purpose.

After a liberal education in the Glasgow and Oxford schools, he was called to the Bar in Edinburgh at the age of twenty-two, in the year 1816. He had distinguished himself by his talents, and Blackwood's Magazine, started in the following year, offered a fair field for their exercise. The pursuit of law was then a blank, and scarcely anything else at any future time. At once he plunged into the literary and political arena with a will. His pen was sharp, his ridicule biting, his opinions energetic, and party spirit raged fiercely throughout the country. He, like Sir Walter Scott, was a high Tory; and no wonder that writers on the other side accused him of many misdemeanours, of want of generosity, and of unsparing criticism. But were his adversaries mealy-mouthed? Were the "Edinburgh Review," the "Monthly Magazine," and other organs of his Whig opponents, gentle lambs to bleat and be barked to death by a cur like this, or by articles in the "Quarterly," or elsewhere? No. *Audi alteram partem*; it was the temper of the times. Both sides fought in earnest, with swords as sharp as they could make them, and Lockhart was neither more nor less than an exceedingly clever and skilful volunteer in the ranks in which he served. If I durst venture an observation, I would say that the style of criticism at the period referred to was less envenomed than it had previously been, and less dictatorial and domineeringly offensive than it is generally at the present day. But be that as it may, the censors of Lockhart are ready to allow that, however objectionable they considered him as a critic, he was "most loved by those who knew him best." In short, he was disliked and abused by those whom he politically disliked and abused; and he was warmly regarded and esteemed by those intimate with him, and who best knew the man himself.

On the most confidential footing with him for twenty years, during which both were anxiously devoted to the active business of literature, I can bear the truest testimony to his ardent feeling on behalf of our literary brotherhood, and the interest he was ever ready to take in their cause. Many a time and oft has he called on me to subserve his exertions, and if all the world could have proved him the sternest of critics, I must still have sought refuge in the conviction that a kinder hearted man did not exist.

The following letter from another hand brings the first and last occupation of Lockhart in London into

curious notice, and has besides, I hope, a sufficient recommendation in itself as the history of a literary enterprise :—

Whitehall Place, December 12, 1825.

MY DEAR SIR,—I cannot allow a moment to pass without thanking you for your very kind and valuable letter. Some of your hints arrest my intention and others confirm it, and none will, I assure you, be thrown away. Few things of this kind have, I believe, commenced with more enlarged views or more honourable intentions, or, perhaps, with more extensive and powerful means of giving them effect; but I am not less sensible to the risque of so complicated an enterprise, however well imagined, from the difficulty of its execution. I have never attempted anything with more considerate circumspection, or with more satisfactory hopes of success, but no one can form an estimate of a publication of this kind until it is published, so accept my best thanks for your good wishes.

Mr. Lockhart becomes the editor of the "Quarterly Review" after the publication of the next number. Mr. Coleridge's engagements at the Bar have nearly doubled during the last twelve months, and he merely held the appointment until I could make-up my mind as to a successor. Mr. Coleridge is without exception one of the most truly amiable men I ever met with.

Believe me, my dear Sir,

Very truly yours,

JOHN MURRAY.

Such were the foundations and hopes on which "The Representative," a daily newspaper, appeared; and besides, the present Prime Minister of England, Benjamin Disraeli, was engaged as one of its staff! Nevertheless it failed, as my excellent friend John Murray experienced to his cost.

The subscription to save Abbotsford, with its library and antiquities, in the line of Sir Walter Scott's descendants, I may briefly allude to, as I was one of the thirty persons chosen to be on the committee of management, with Lord Montagu at its head. This sad consequence of the loss of £170,000 was not easily averted, and I can only say I worked hard in my humble sphere. Among other steps, I wrote to Lockhart—the measure was rather unpleasant to his proud heart—and I received the subjoined answer :—

MY DEAR SIR,—As this affair was set afoot without consulting any member of the late Sir Walter's family, and as the present baronet has not thought fit to interfere either one way or other, I am not aware that I can have any title to say a word to you or to any one else thereupon. I shall, however, be most happy to forgoth with you, and shall be at the Athenæum to-morrow at half-past four, in case that hour should suit you.

Ever very sincerely yours,

J. G. LOCKHART.

For eighteen years, from 1825, Mr. Lockhart was the able editor of the "Quarterly Review," and much augmented his fame as an original author. The list of his works is larger than is commonly thought. "Valerius," "Adam Blair," "Reginald Dalton," and "Matthew Wold"—interesting works of fiction—"Peter's Letters to his Kinsfolk," of political interest, the Lives of Burns and of Napoleon, and the admirable one of his father-in-law Sir Walter Scott, and his heroic Spanish Ballads, unsurpassed by any production of the kind in the English language, are abundant and sterling proofs of the versatility and extent of his genius. I possess much of his familiar correspondence, but no letters I think suited to my design, or worthy of publishing, except one, a sad one, which foreshadows the close of an eminent career in the world of literature :—

Milton Suburb, Lanark,
Aug. 20, 1853.

DEAR MR. JERDAN,—I am very sorry to learn that you also have been suffering in health, and hope the affliction may prove transitory.

I struggled as long as I could, but the stream was at last too strong, and now I must, like many elders and betters,

submit to the usual consequences of quitting a regular profession for the chances of another career. But in my case, as I have now no family to care for, all this is of trifling concern. I am to pass the winter at Rome, and the time of return is at least very uncertain.

Yours truly,

J. G. LOCKHART.

He returned only to die in the following November, at Abbotsford.

JOHN MURRAY.

It is not easy to move away from this melancholy vein to another of a lighter nature; but before I mention a different characteristic of Lockhart (having casually brought in the name of his friend) I take leave to devote a few lines to one who was, not without just reason, hailed by contemporaries as a prince of publishers. I had many transactions with him, and can bear witness how well he deserved the title. In many instances I found him liberal, generous: liberal to authors whose productions he published (not always with success); and generous to the distressed relatives of those who were unfortunately ambitious of literary distinction. I could instance well-known names of persons indebted for succour to this munificent disposition. There were other gentlemen in "the trade" (who I dare say have also their successors) well entitled to the praise of distinguishing judgment in the conduct of their important affairs. But John Murray, while clear-headed as a man of business, was ever heartily ready for social intercourse and enjoyment.* How shrewdly he could mingle the two, one little anecdote may illustrate. When Shiel's first tragedy came out he was much struck with its beauties, and the next morning sought the author and gave him (I state the amount from memory) £600 for the copyright. What profit it produced I cannot say; but on Shiel's second tragedy being performed, when he came to Murray next day for the expected (at least) £600, the humorous publisher advised him to go to another great house, which was more likely to meet his views and honour his aspirations.

I once invited Mr. Murray to join me in a large undertaking. He gave very convincing reasons for declining, and one of them was, "secondly, from recurring to my temper, I should, I know, make a restless and fretful partner, which is the reason I have hitherto kept myself to myself." In another letter he repeats, in an equally characteristic tone, "I decline joining, from the thorough knowledge of myself. But I should be a restless and teasing partner; and indeed I can absolutely do nothing when I am obliged to act with others." I never heard a complaint beyond a hasty word of Mr. Murray's temper. He raised himself to an equality with the most important publishing firms, and became a great literary power, and was much esteemed in the class of society to which he belonged.

But to conclude my theme. The meetings of distinguished travellers, authors, and literary men at Mr. Murray's hospitable board, was an enjoyment of no ordinary description. His mention of Mr. Henry Ellis in the following letter reminds me of other pleasant social meetings. Even this short note suffices to show the kind, intelligent, and friendly man :—

Albemarle St., March 26, 1834.

MY DEAR JERDAN,—I am really yearning to see you, and would have backed my constant enquiries after you by calling, had not the absence of my son upon a business travelling excursion through England and Scotland caused all the business to fall upon me, at the busiest time. Pray let me

* His opinion, frankly pronounced, of many works, both of his own and other publishers, showed great judgment and critical skill.

know, as soon as possible, when you can do me the favour of dining with us, that I may get some of our old friends together. John returned on Saturday for a few days, and desires me to offer his kindest remembrances to you.

The Bavarian minister has just sent me the plans and elevation of the magnificent picture-gallery now erecting and nearly completed at Munich, and for which the Bavarian senate voted £50,000. If I could induce him to lend them for a few days, do you think they would be of any use to you to make an article out of?

I dine at our friend's, Henry Ellis, to day. Pray accept the assurance of my kindest regard, and believe me,

My dear Jerdan,

Faithfully yours,

JOHN MURRAY.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER II.—LERIDA, ZARAGOZA, TARRAGONA.

CERTAINLY Spain is a country of most singular contrasts, and in many respects it was very different from all my preconceived notions. I had pictured to myself a soft southern land with all the luxuriant charms of voluptuous Italy: This certainly is not the case as to the greater part of the country, though some of the southern provinces bordering the seashore have all the charms that those favoured latitudes can boast; but much of Spain is indescribably stern and melancholy, with rugged mountains and long sweeping plains, destitute of trees, and silent and lonely so as quite to oppress the spirits.

On first leaving Barcelona, nothing can be richer than the aspect of the scene. Vineyards and cornfields on all sides display the bright tender green dress of the early spring. At Igualada, where we slept the first night, high hills and deep wooded clefts varied the scene. The weather was so exquisitely lovely, that we saw it to the greatest advantage; but between Cervera and Lerida the dreariness of the country is most wearisome and monotonous: not a tree to be seen, not a living thing, not even the note of a bird, to enliven the spirits or break the profound solitude. This utter absence of all small birds is one of the singular features of Spanish rural scenery. The eagle is seen wheeling about the mountain cliffs, or soaring over these endless plains, or the grim vulture swoops down upon his food—even the queer solemn bustard frequents these solitudes; but these birds can only be seen at rare intervals, while the myriads of smaller birds which animate the scene in other countries, are met with in but few provinces, and in those chiefly among orchards and gardens, in the immediate vicinity of men's habitations. After leagues and leagues of this dreary country, we quite rejoiced to see Lerida appear in the distance, its lines of fortifications gilded by the setting sun, the river Sègre running beneath the hill on which the old cathedral and the mass of fortified buildings are placed. Fully 3000 feet above the river is the fine old tower, and those who are not afraid of the ascent will be rewarded by a very fine prospect from the summit. The number of sieges that this town has sustained seems almost incredible; but its position, of course, always rendered its possession very important to both the invader and the invaded. We made Lerida our second sleeping-place, hoping to reach Zaragoza the third day. The inn, La Posada del Hospital, was really far better than we expected. The greatest trial to all the party was the impossibility of getting any food at all unflavoured with garlic: meat, fish, and fowl, nay vegetables, were all strongly impregnated with the powerful taste. So we did the best we could, and lived principally upon eggs, bread, chocolate, and fruit. Spanish

confectionary is generally very good. The love of sweetmeats is so universal amongst the Spanish women, that they are sure to be excellent everywhere. The pastry is most admirably made: perhaps the extreme beauty and purity of the flour may help to cause the excellence of everything that is made of it.

Again did we experience the same alternations of country as we had seen before Lerida. Ravines and small oddly-shaped hills extend for miles and miles, to be succeeded by a fertile valley abounding in pomegranates and various fruit-trees; and then again an arid desert with neither trees, nor crops, nor living creatures!

Our first impressions of Aragon were sombre. The province is entirely surrounded by mountains, is very thinly peopled, and a great deal of the land is uncultivated that might be rendered fertile and productive. The people are not more attractive than their country, they are wholly wanting in the gaiety and light-heartedness of the Andalusians and Valencians; but they have their merits, notwithstanding; the men are vigorous and active, and very brave. The peasantry are wonderfully fond of bright colours, blue, red, crimson, and purple, and their silken sashes are generally chosen with a view to gratifying this taste. Their obstinacy is most remarkable: nothing can change an Aragonese when once he has got an idea into his head.

Zaragoza, or Saragossa, the capital of Aragon, is a singular, gloomy-looking old town: the frightful damage caused by the French is more visible here than in many of the other towns in Spain. Hospitals, palaces, churches, all fell beneath their destroying hosts. The bridge over the Ebro is very fine, and the view of the two cathedrals is most striking and uncommon. The worship of the Virgin Mary is here carried to a height most unusual, even in a Roman Catholic country. It is very singular that there should be two cathedrals in Zaragoza, and not one in the capital town, Madrid; but Spain is a land of contrasts! There is much that is interesting to be seen in the first cathedral, as it is called; the second one should be visited, but there is much bad taste displayed in the decorations, both interior and exterior.

Zaragoza is the great resort of pilgrims from all parts of Spain. The legend runs thus:—"Santiago, or St. James (patron of Spain), soon after the crucifixion, applied to the Virgin for her permission to preach the gospel in Spain. Having obtained her consent and kissed her hand, he came to Zaragoza, converted eight pagans, and fell asleep. Then, A.D. 40, the angels brought her alive to him from Palestine on a jasper pillar, and carried her back again after she had desired him to build a chapel upon the spot." And this Chapel of the Pillar is raised in the centre of the cathedral, and lights are kept burning there day and night. The floor is paved with the richest marbles. The pillar is partially concealed and nailed round, and only royal personages are allowed to enter the sacred inclosure. The anniversary of the descent, October 12, is the time of the great concourse of pilgrims; upwards of 50,000 have been known to be in the town at the same time.

There are some very curious and beautiful specimens of ancient houses in this quaint town. The spiral pillars and the delicately-carved open work in the inner courts of the house called "The Infanta" are exquisite, and the beautiful decorations in other parts of the dwelling are most admirable. It has been taken very little care of, and there are many signs of decay; but even in its present state the splendid staircase, the delicate twisted pillars round the patio, or inner court, are very greatly to be admired; and architects of the present day

might take many a useful lesson from them. All the finest libraries, some of the most valuable in Spain, were utterly destroyed by the French invading armies.

Zaragoza has been in all ages subjected to the chances of war. The number of sieges is almost beyond count; and the whole place is full of interest in connection with

were told, between thirty-five and forty pounds each! As we approached Villa Franca de Parrades, the earliest Carthaginian settlement in Catalonia, the fertility increased, and the delicious aromatic scent of the under-wood was most agreeable. The magnificent bridge called De Lledones is a very fine structure, though it

RUINS AT TARRAGONA.

bygone days. The streets are narrow, steep, and gloomy; how they ever contain the vast numbers that throng them during the time of the concourse of pilgrims it is difficult to imagine.

We intended to return to Barcelona so as to be there on the 23rd of April, as that day is the day of St. George, the patron saint of the Catalonians, and in consequence a day of great festivity. A great market or fair of flowers is held in Barcelona on that day; and right glad were we that we had taken the advice of our Spanish friends, and remained to witness so beautiful a sight. I have frequently been in Italy at the most flowery time of year, but anything like the gorgeous display of the flower fair at Barcelona I certainly never witnessed. The fair is greatly resorted to by all the young and pretty ladies in Barcelona. Their gay dresses and the picturesque costumes of the peasants add to the beauty and animation of the scene.

From Barcelona we were to take the road to Tarragona, where we intended to remain two or three days. There is nothing of any particular interest between Barcelona and Tarragona. The road passes through a fertile country, vines and olives abounding everywhere, and at that cheerful time of year the busy women were all sitting in the open air making lace. The size of the loaves of bread struck us as something prodigious: they sometimes weighed, we

only crosses a ravine between two hills, and the views either way looking from the centre are very striking.

The situation of Tarragona is commanding, standing on a rock between seven and eight hundred feet high. It has many historical associations. English visitors will remember the capture of the place by the celebrated Lord Peterborough, in the War of the Succession; and here, as elsewhere, the horrors that took place when it was taken by the French exceed everything one can imagine. We never were tired of rambling along the walks round the ramparts, the views are so fine, and the Roman remains that everywhere meet the eye add to the interest. The Roman aqueduct is splendid: the highest arches are between 90 and 100 feet in height, and the length is very great. We found our inn so comfortable, and there was so much we wished to see at Tarragona, that our few days became a week, during which we passed our time most agreeably. There are some delightful expeditions to be made in the neighbourhood: one through pine woods sloping down to the shore, the road following the windings of the beautiful little bays where the craft of the fishermen lie at anchor, or float smoothly on the brilliant sea.

It is very striking in Spain that all the cathedrals, with few exceptions, as far as I have seen, stand on an

eminence; and in the interior, the high altar is also raised, and the priests ascend the steps to the elevated | them is most powerful. There are some painted windows in the cathedral, that are as fine as any I have

BRIDGE AT SARAGOSA.

eyes of the Spanish people, both literally and figura- | tural beauty. We made an interesting excursion to the
tively, and the influence the clergy still exercise over | now ruined monastery at Poblet: it is situated in a beau-

tiful valley, as are most monkish establishments that I have seen. The name of this valley is very poetical, "La Conca de Barbara" (the shell of Barbara), and in many former accounts of the monastery it was spoken of as the pearl of "the shell"; but now all is the picture of desolation, as far as the buildings are concerned. It is an interesting spot as having for long been the burial-place of the kings of the Aragonese line: here, as elsewhere, the French troops did much damage rifling the royal graves of their contents in the most ruthless manner.

The road from Tarragona is charming, and the scenery nearly all the way to Valencia as varied as possible. Our carriage really was very comfortable, and our driver and horses much more obliging and easy to manage than is generally the case with that fraternity. Vineyards extend for miles and miles without intermission, covering the country with the most brilliant green foliage. The vintage, we were told, was managed in such a rude and untidy manner, that during the season everything was dyed deep red, from the juice of the grapes. Men, women, and children, carts, even the very streets and roads, partook of the universal colour. The famous Muscatel wines are made from these grapes; and also very celebrated brandy. The vineyards extend down to the coast, and palm-trees raise their lofty heads in token of the tropical heat of this district. Were it not for the freshness of the sea breezes, the heat in summer would be tremendous. Even on the 1st of May, when we left Tarragona, we found it quite sufficiently warm to make us gladly choose the early morning hours, and the beautiful later time after sunset, for our travelling, generally making a considerable pause towards the middle of the day. As we wound along this coast road the sea was of the deepest cerulean blue. Nothing can exceed the brilliancy of this southern colouring. The eye would weary of its sameness were it not for the repose of the rocky gorges that the road occasionally traverses. Nothing could be more striking than the view both of land and sea just before our entrance into a ravine with a most ill-omened name, Barnauco de la Horta, or ravine of the gibbet. To carry on the unpleasing association, we had to pass another mountain gorge, called the Col de Balaguer, the haunt of notorious bandits and bandoleros.

The plague of mosquitoes was most terrible, we were told, especially later on in the year. The women protect their arms by long mittens that look like Valencian stockings with the feet off. Their earrings are very remarkable, and very African in their appearance: they are so heavy that they have the additional support of a string passed over the top of the ear. They prize them greatly, and I found much difficulty in procuring a pair to bring home as a specimen. Nothing pleased them more than any appearance of admiration for their costume, and they readily entered into conversation with those who spoke their language. The villages were very bright and pleasant to look at in the lovely blooming spring. The Catalan hamlets are reckoned very good specimens of Spanish villages, the inhabitants being, generally speaking, more industrious than is usually the case with the Spanish peasantry. The cottages are rather curious, and somewhat unlike what we are used to. They are very narrow and of considerable length. The hearth is the first object that strikes you, with the bright crackling logs of wood on it, and on either side are recesses where the family sleep, and on beyond in the background are the stalls for the oxen and mules. Over head are roosting places for the fowls, and hay, and straw, and other provender are piled up

ready for use. One entrance serves alike for all, human beings and animals. The cleanly appearance that these cottages have is therefore extraordinary, and does no small credit to the Spanish housewife, though of course, as in our own country, there are the tidy and the untidy. One thing to be said is, that in such a climate as the one they are blessed with, the whole family of a Spanish peasant lives out of doors, very seldom entering the house but to sleep, or in the rainy season. In consequence of this universal habit, there are no windows, though occasionally there is a sort of apology for them. It is very amusing watching the proceedings in one of these hamlets. Lacemaking is universal in the neighbourhood of Barcelona and Tarragona; and very picturesque the pretty young girls look, with their pillows on their knees, and the bobbins passing rapidly through their slender fingers. The mothers are busy over all the household work, making clothes, cleaning vegetables, etc., etc., while the old women bask in the sun busy with the maize, or Indian corn, pulling off the long dried leaves, which serve admirably to stuff their mattresses, while the ears themselves are laid aside till required for use. The distaff is still constantly seen, and it is generally the oldest women who are employed in spinning, long after they would seem to be past all work. Fruit and vegetables make the greater part of their food; pumpkins are grown everywhere, even in the tiniest bit of ground belonging to a peasant, and they are very universally liked. Slices of pumpkin roasted, or frizzled rather, over their charcoal fires, is a favourite dish amongst the poorer classes. They grow to an immense size. The labour of watering these small gardens is very great; but absolutely all chance of produce depends on the ground obtaining a good supply of water. At all the inns in this part of the country, the attendants held in their hands fans covered with bright paintings, to drive away the flies. In private dwellings these fans were very beautiful, with bright silver filagree handles, and the greatest taste was shown in the paintings and ornaments with which they were decorated. These are the real eastern fans, the *Manâsheh*, as they were called by the Moors. Even where the people are too poor to use fans, they make the palmetto leaf serve the same purpose. The plague of flies is so great that it would be impossible to exist without some precaution of the kind. But I must go on with my journey.

It was getting late—later than we usually travelled—and we had been told so many fearful stories connected with the road we were travelling, that two ladies began to feel a little anxious to arrive at Vimaroz—I can answer, at least, for myself—where we were to sleep. The road from Amposta (a town we had passed not long ago) to that place was famous, or rather infamous, for the tragedies that had there taken place. We passed by two rude stone crosses, marking the spot (as our coachman told us) where two fearful murders had been committed.

Our fears, however, were soon dissipated on crossing the fine bridge built by Charles I over the river Cenia, and we were greatly amused at the same time by our coachman taking off his hat and waving it vehemently in the air. On asking for an explanation, he told us that he was a Valencian, and that it was to show his delight at re-entering his own beloved province. After crossing this bridge we were in Valencia.

Vimaroz seemed to consist chiefly of a fishing population. Had it not been for the excellent fish they gave us, and the contents of our well-stored hamper, our plight as regards eating would have been a very sorry

one. The inn was the most primitive house of entertainment that some of the party had ever seen. My knowledge of the language did us some good, and the people were perfectly obliging, and very anxious to comply with our demands as far as they were practicable; and so the night was passed somehow or another, and the delicious weather in the morning, and the charming drive to Valencia, soon obliterated all recollection of its inconveniences. Our road wound in and out of different gorges, passed the Pena Gelosa Hills—the whole air was scented with the different aromatic herbs that grew so luxuriantly everywhere—and gradually brought us more and more into the lovely fertile land of Valencia—a very land of plenty amidst all the beautiful produce of those southern regions—till we reached Burjasot, a most charming spot, embosomed in gardens, which cover the gentle slopes on which it stands. Here all the wealthy Valencians retire to enjoy the soft refreshing breezes. There are most curious caves dug in the hill, of Moorish origin, and these are used for preserving corn. The figs that grow in this sunny spot are said to be superior to any that can be produced elsewhere; plants have been sent both to Italy and France, but the Burjasotes fondly flatter themselves that their produce does not equal that from the parent trees. The view of Valencia from the esplanade is beyond everything charming, surrounded, as it seems to be, by those most picturesque trees, the oriental palm and the beautiful cypress. The moon was shining on the deep blue sea, and lighting up all heaven and earth with its soft and solemn light, as we entered Valencia, and took possession of the comfortable rooms ordered for us by our kind friends.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

" 'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."
COWPER.

NO. IX.—COUNTRY LETTER-CARRIERS.

THE country letter-carrier and village postman is always a noteworthy person in a rural community. Expected alike by gentle and simple, known to every one in the neighbourhood, from the squire to his humblest tenant, from the farmer to the day-labourer, from the parson and doctor to the sexton and shopman, the country letter-carrier is welcomed in his coming and bidden God-speed in his going. Other men might come and other men might go, and their going and coming might not attract the special attention of a neighbourhood; but a week's absence of the letter-carrier from his accustomed round would be little short of a calamity to the whole district. Nowadays, when half-a-dozen deliveries *per diem* are deemed barely sufficient for the transaction of the domestic and mercantile needs and necessities of the mighty million "of the great Babel," it requires some mental exertion to endeavour to realise that former state of things in the United Kingdom, when the sending of a letter was as grave a business as the sending of an embassy; and when, till comparatively modern days, the country letter-carrier, with his tin horn, was a being as unknown as the unicorn, and equally as useless to society. But, while that heraldic quadruped still remains in the realms of myth and fiction, and only emerges from them to dance attendance on the royal arms, the country letter-carrier has become an established fact and a necessity of our social existence. What

should we do without him, we country folk and rural people, "remote, unfriended, solitary, slow," in the nooks and corners of the land, in villages like our *Minima Parva*? As it is, we are frequently accused of stagnation by our friends from town, but that stagnation would assume a deeper degree of quiescent immobility, if we were cut off from all communication with our letter-carrier. He is a daily link between us and the outer world of distant friends and relatives, a medium through whose agency we can obtain peeps through the loopholes of the press; a "messenger of grief, perhaps, to thousands, and of joy to some," and "the herald of a noisy world," who, even now, often ushers in his budget of news "with heart-shaking music."

A personage so important is worthy of special treatment, particularly from the pen of one who, for many years, has been so dependent upon his services. Let the country letter-carriers, then, be my theme, in this September month, when the scattered unity of our population will, in their home tours and foreign travels, make acquaintance with so many specimens of this widespread class. We will not, then, here trouble ourselves with any search into the recondite history of the conveyance of letters in earlier times. The horse-posts of Cyrus are dead and gone, and the doves of Anacreon but rarely have their modern counterparts, unless it be in the pigeons tossed in the air from the Epsom downs. In the twenty-three centuries that have elapsed since Mordecai, at the bidding of King Ahasuerus, "sent letters by post on horseback," with other "posts that rode upon mules and camels" (Esther ix. 10, 14), the world's history will tell of numerous schemes and varying methods that have been devised and employed to ensure the safe and speedy transmission of intelligence. It would require many pages merely to give an abstract of such schemes and methods of which the Oriental nations were the chief originators; and it would demand a still larger space to trace the rise of our own great central establishment at St. Martin's-le-Grand, and the gradual development of its wonderful machinery of management, from the royal liveried postmen of Henry the Third's day to Mr. Ralph Allen's establishment of cross-posts in 1720, from Mr. Palmer's mail-coach system of 1784, to the development, by Rowland Hill, of that penny postage system, introduced on January 10, 1840, which, nearly a century before, had been established in Edinburgh by Peter Williamson, and which had been purchased of him by the government in 1760. Leaving, therefore, this larger portion of this great subject, with its various branches, such as the introduction of the book post in 1848, the pattern post, the money orders, the savings' bank, and the various beneficial ways in which the Post-office system is worked, and which have already been noticed in these pages,* I would here restrict myself to a mention of those humble officials of the Post-office who so largely assist in carrying out its efficiency in the remotest nooks and corners of the land, by tramping their weary rounds, day after day, through sunshine and storm, mud and dust, heat and cold, at one time moist with July heat, at another with "spattered boots" and "frozen locks," like the Olney letter-carrier who brought Cowper's newspaper as the dusk of the winter evening was gathering round.

For, the gentle poet and the good people at Olney would appear to have been obliged to wait for their letters and papers until late in the afternoon, being in the condition of those described by Crabbe,

* See the Leisure Hour, "Post-office Progress," No. 692; "Post-office Annual Report," No. 766, and other articles.

"Who, far from town,
Wait till the postman brings the packet down."

And this is a condition that still obtains in many rural spots where the letter-carrier does not deliver up his bag to the keeper of the receiving-house until nearly midday. And the worst of it is, that the later the post is in coming in, the earlier it is in going out; so that, to answer letters by return of post is a business that entirely breaks into the whole day. If we are expecting to receive an important letter we cannot stir from home until it has been delivered; and then we are unduly hurried in replying to it. In the days of Cowper and Crabbe, correspondents did not expect to receive such speedy replies to their communications as they look for in this present day of railways, telegraphs, and penny postage; though, to be sure, Cowper, in 1765, wrote from Huntingdon to his cousin, Lady Hesketh, "If I was to measure your obligation to write by my own desire to hear from you, I should call you an idle correspondent if a post went by without bringing me a letter." But then (as Southey said) Cowper was one of the best letter-writers of the century, and he was not "so unreasonable" as to expect his cousin to write to him when it was not convenient for her to do so. The transmission of correspondence, slow and tedious as it then was, when compared with our own day, had been greatly accelerated since Taylor, the water poet, described the postmaster of that same county-town of Huntingdon, as he found him in 1618. The name of this worthy was Riggs, and he kept the Crown Inn in the High Street of "the gloomy brewer's" town; for the postmasters of that day were usually innkeepers. "He was informed who I was," says Taylor, "and wherefore I undertook this my penniless progress; wherefore he came up to our chamber and supped with us, and very bountifully called for three quarts of wine and sugar, and four jugs of beer. He did drink and begin healths like a horse-leech, and swallowed down his cups without feeling as if he had had the dropsy or nine pound of sponge in his maw. In a word, as he is a post, he drank post, striving and calling by all means to make the reckoning great, or to make us men of great reckoning. But in his payment he was tired like a jade, leaving the gentleman that was with me to discharge the terrible shot, or else one of my horses must have lain in pawn for his superfluous calling and unmannerly intrusion." Such is the poet's portraiture of the Huntingdon postmaster forty-two years before the General Post-office was established by Act of Parliament, and deprived innkeepers and private persons of the privilege to "provide and prepare horses and furniture to let to hire unto all through posts and persons riding in post, by commission or without, to and from all and every the places of England, Scotland, and Ireland, where any post-roads are." From 1660 such persons were to be appointed only by the Postmaster-General and his deputies; and they were not only to supply horses at half-an-hour's notice, but also to provide a guide with a horn to such as rode post.

This horn was the customary badge of office of the country letter-carrier; and, when Cowper removed from Huntingdon to Olney—still keeping to the banks of that river whose scenery he loved, and in whose "noble stream," as he called it, he loved, while at Huntingdon, to bathe three times a week—the approach of the letter-carrier, as he came over the long straggling bridge (the forerunner of the present structure) "that with its wearisome but needful length" spanned the waters of the Ouse, widened to a "wintry flood," was heralded to the poet and the people of Olney by the

sound of his "twanging horn." Indeed, the long tin horn was not the peculiar badge of the country letter-carrier, for it also was used by the town distributor of correspondence and news: and it will probably be within the personal recollection of many of our readers, that the delivery of letters in London and other large cities, was accompanied by a hideous fanfaronade of tin horns, each postman performing a wild solo with a power equal to the "blast of that dread horn" borne on those Fontarabian echoes that came to the ears of King Charles. The arrival of the mail-coach was announced by a similar tin-horn solo, except in those cases where the red-coated guard was a sufficient musician to play upon the key-bugle. Such a musician was the "Charley James" of my younger days, the celebrated guard of that most celebrated coach the "Hirondelle" (the word was always pronounced as spelt), which, with the "Hibernia," conveyed the mails from Worcester to Shrewsbury. On May-day they raced to see which coach could accomplish the journey in the briefest time; the coaches were gay with May-boughs, the horses with ribbons and resplendent harness, and the guards with new redcoats, and Charley James "qui scarletum coatum habebat," as the comic Latin grammar says, played spirit-stirring melodies on the silver key-bugle which had been presented to him by admirers of his musical talent. But that was an exceptional case, and the common tin-horn was the normal instrument and badge of office of the mail-guards and letter-carriers.

It was with such tin-horns that the "Mercuries" and "hawkers," as the newsvendors of Cowper's day were called, announced the publication of "The Spectator," "The Flying Post," and other papers of the period; and it was with similar twanging horns that the victories of the British arms by land and sea, under the great captains of the age, Nelson and Wellington, were first heralded to a noisy world. "Glorious news!" "Great victory!" "A thousand prisoners!" and such like cries, were shouted by them in stentorian tones in the brief intervals when their horns were silent, and these cries took the place of those sensational advertisements of the penny press, which we are daily accustomed to see in railway-stations and in newsagents' windows. A roll of the "Extraordinary Gazette" in one hand, and a copy of the same tied round their hat, proclaimed their calling, even if any one had been so deaf as not to hear the noise of their horns and clamour. At length these tin-horns became a nuisance so intolerable, that, in the early part of the reign of George IV, they were forbidden by law to be used in the London streets. A fine of ten shillings was to be the penalty for a first conviction of the offender, and twenty shillings for a second conviction. Thus in towns the tin-horn was put down, together with muffin-bells, dustmen's-bells, and other similar disagreeables, although the two last-named are still permitted at London-super-Mare, much to the annoyance of Brighton visitors, especially those who are invalids, and have been recommended to lodgings in a quiet street, where, as is always the case with "quiet streets," the fish-sellers, the nigger vocalists, the acrobats, the Punch shows, the stray musicians, and the other flotsam and jetsam of a fashionable seaside town, most do congregate, making the street as "full of noises" as Prospero's island, and giving the modern Hogarth a subject for a companion picture to his "Enraged Musician."

The urban letter-carrier has vanished, together with his tin-horn; and the town postman has changed to a smart-liveried person whose sharp rat-tat and hurried walk are heard several times in the course of the day.

"Every day, as sure as the clock, somebody hears the postman's knock," is the not very recondite remark of a song, whose popularity is due to the liveliness of the air to which it has been wedded; which air, by the way, strongly recalls the melody of "The Witches' Dance," in Locke's music to "Macbeth." But, though "somebody hears the postman's knock," it is highly satisfactory to the inhabitants of "the great Babel" that nobody hears the postman's horn. Yet, as fashions survive in the country long after they have gone out of date in town, so the postman's horn is still to be heard "twanging" as it did eighty years ago at Olney. In rural districts, the letter-carriers, as they plod their round from village to village, still, in numerous instances, continue to herald their approach with that "heart-shaking music" in which they indulged in Cowper's day. Here, for example, in *Minima Parva*, I hear the sound of such a twanging horn from such a country letter-carrier nearly every day in the year; and experienced ears will detect its peculiar twang from the like tin-horn performance of the rag and bone collector, as he also makes his rounds from cottage to cottage, and announces his coming with horn-blowing. Indeed, those lines of Cowper's—the seven first in the fourth book of "The Task"—would still aptly describe the country letter-carrier of the present day, as he may be found in many rural districts. And dear to artists is the country letter-carrier! Painters of the English *genre* class delight in him; and very rarely is there an exhibition of modern paintings without a picture of the country letter-carrier depicted under some one of the many varieties that he presents. And it may not be out of place to say that those seven lines from "The Task" descriptive of the Olney postman appeared in the catalogue of "The Exhibition of Drawings and Sketches by Amateur Artists," held at 121, Pall Mall, in the year 1853, appended to drawing No. 394, the amateur artist of which was the present writer, who had long loved the poet of Olney and all his works, and who, in that drawing, endeavoured to realise his idea of Cowper's country letter-carrier.

But, to come to real artists—to such men as Mr. Frederick Goodall, and those who have limned the country letter-carrier in his many aspects and diverse surroundings. Some have represented him, as Mr. Goodall has done, lounging in the yard of the village inn while its inmates and frequenters discussed the news in the opened paper or looked at their letters. Others have shown him turning away with a pitying expression from the widow to whom he has given the black-edged envelope, whose contents will inform her of the death of her only son. "Sad news from India" was the title of this picture, produced at the time of the mutiny. Again, too, has he been shown, handing to a pleased recipient the white-enamelled envelope with its wedding-cards. "It'll be your turn next, miss!" was the suggestive title. For it is a pleasing characteristic of the country letter-carrier, that he has a word for every one. The town postman is too hurried in his duties to allow him to converse even with the policeman; and he is little more than a human machine performing its work at a regularly-sustained speed, and marking its rapid progress by a sharp rat-tat, as the letters are slipped into the box, and the postman is rat-tatting at the next house before the servant can answer the door. If the town postman has occasion to pause for a talk, his conversation is of the most business-like character, to ask for a signature for the receipt of a registered letter, or something equally official. But the country letter-carrier has a word for every one he meets, from the

stone-breaker on the road to the squire in "the high hall-garden." Sometimes he has to read to the recipient the letter that he delivers, spelling out the crabbed handwriting of the ill-written scrawl that would tax even the powers of that so-called "blind man" at the General Post-office, whose peculiar province it is to decipher those postal addresses that seem to other persons as difficult as cuneiform inscriptions; and this is one phase of his varied character which has been represented by artists. Others have depicted his increased importance on St. Valentine's Day, which is a day that always adds largely to the letter-carrier's labours both in country and town. Charles Lamb wrote of it, that, on this day, "the weary and all forspent twopenny postman sinks beneath a load of delicate embarrassments not his own." And Elia thus speaks of the postman's knock:—"Not many sounds in life, and I include all urban and all rural sounds, exceed in interest a knock at the door. It 'gives a very echo to the throne where Hope is seated.' But, its issues seldom answer to this oracle within. It is so seldom that just the person we want to see comes. But of all the clamorous visitations, the welcome in expectation is the sound that ushers in, or seems to usher in, a valentine. As the raven himself was hoarse that announced the fatal entrance of Duncan, so the knock of the postman on this day is light, airy, and confident." And so, the letter-carrier on Valentine's Day is a subject of which Mr. G. Thomas and other artists have taken advantage. Last year, in the Suffolk Street Exhibition, there was a very clever picture by Mr. W. Hemsley, called "The Village Postman, 'nothing, I'm afraid, this morning, miss.'" To which title were appended these lines from the passage in "The Task":

"Messenger of grief,
Perhaps, to thousands, and of joy to some;
To him indifferent whether grief or joy."

The expected message in this instance would appear to have been a joyous one, to judge from the expression of the bright-faced and brightly-dressed young lady who looked anxiously over the old postman's shoulder, as, with spectacles on nose, he turned over the letters in his hand. The pastoral landscape behind these well-drawn figures made the picture a pleasing and characteristic representation of the modern country letter-carrier in England. What he is in Ireland, Mr. Erskine Nicol has shown us in his important picture of "The Cross Roads," in this year's exhibition of the Royal Academy, where "Shaun the Post" is seen getting his bags in readiness for the expected car.

A primitive country letter-carrier will be seen in this sportsman's month, by many an English deer-stalker, grouse-shooter, fisherman, or tourist, in the wild and pleasant places of Scotland and the West Highlands. When the blessings of the post had been spread far and wide, and every town in the United Kingdom could boast of its post-office, it necessarily happened that, in thinly-populated districts, the mail carts had to be supplemented by letter-carriers; and this was especially the case in the Scottish Highlands. But when the universal penny had penetrated into the remotest regions, and the number of letters and letter-writers had increased, proportionate facilities were granted for the spread and interchange of their communications; and, at the present day, there are few villages in the Scottish Highlands that cannot show to their Gaelic-speaking inhabitants some one heather thatched cottage, marked out from its neighbours by being dignified with a board on which is painted the magic English legend "Post-office." This cottage is

commonly the village shop, wherein all the necessaries of life can be obtained, from candles and bacon to linen and broad-cloth. If the village is not on one of those famous turnpikeless roads that are daily traversed by dashing mail-carts, the letter-bag is taken to the nearest point at which the mail-cart will pass. Of course, too, it happens, as in many rural districts in England, that there are people who are so locally situated as to be cut off from the nearest receiving-house by some miles of hill and dale; and such persons are necessarily compelled to establish for postal purposes their own letter-carrier—the *gille-ruithe*—to give him his proper Gaelic designation. These gillies, whose daily duty it is to carry the laird's letter-bag to and from the mail-cart, are usually lads; for the word *Gillie* (or rather *gille*) is not strictly confined to the age of boyhood, any more than our English postboy is prevented by his boyish appellation from being a wizened man of sixty; and *gille* is any servant, whether he be the *gille-ruithe* or "running footman," or the *gille-cois* or "footman," or the *gille-each* or "groom." And *Gillie Callum*, who gave his name to the tune to which the sword dance (hence called after him) is performed, was a servant named *Calum*. The modern *gille-ruithe*, then, the running footman, or letter-carrier *gillie*, is usually a lad, and more frequently accomplishes his to and fro journeys in the normal West Highland manner of children and women, that is, with bare legs and feet. But the *gillie* from whom I, one September, made a sketch, was somewhat of a swell, and had been endued by his laird with stout boots and a velvet coat, around which was slung the deerskin letter-bag. As he had to traverse the ground between his master's house and the post-office four times a day, and as the distance, though only three miles by the crow's flight, was "over brake, brook, and scaur," and down into the heart of a deep glen and "squinting" (the Queen herself has adopted this expressive word in her "Journal") the shoulder of a precipitous hill, we may fairly admit that this Highland specimen of a letter-carrier did a fair amount of walking ere the Sabbath brought him that rest which its very name implies, but which is denied to so many country letter-carriers in England.

Such a *gille-ruithe* as I then saw, was once an important member in the establishment of every Highland laird. His duties compelled him to be continually on the move, and frequently to undertake long and perilous journeys in the delivery of his master's missive. The crossing of a river when it was "in spate" or swollen, was an ordinary circumstance required in the duties of the *gille-ruithe*, whose inventive powers were often severely taxed to devise an expedient for keeping his laird's letter safe from wet, while he stemmed the torrent or swam the river. And when the abilities for letter-writing increased, and the facilities for intercommunication of ideas were heightened and developed, the office of the *gille-ruithe* was not discarded in the Western Highlands, the running footman being retained for postal services, and not for attendance upon carriages and state coaches—a custom preserved to the present century, and recorded in the sign of "The Running Footman," in Charles Street, Berkeley Square, London. Some Highland families of distinction—like the Duke of Gordon at the end of the seventeenth century—were accustomed to supply their lack of postal news by sending their *gille-ruithe* on a month's tour, with instructions to store up in his mind as large a budget of information as he could diligently acquire and carefully remember. So that a letter-carrier who adequately filled such an occupation, must have had much of that

talent which distinguished Mr. William Woodfall, who, when the "Morning Chronicle" was started in 1769, and the reporting of parliamentary debates was forbidden by the standing orders of both Houses, was accustomed to listen to the speeches and write a report of them from memory. Previous to that, the pen of Dr. Johnson had been employed to write such allegorical or imaginary debates as should escape the penalty of the act; a circumstance thus referred to by Dr. W. H. Russell, in his speech at the Newspaper Press Fund dinner, on the 6th of last June:—

"Since the days when it was difficult for Dr. Johnson to write imaginary debates, in which he conferred, no doubt, a great deal of eloquence on what he dared say were very dull and stupid men, down to the present day, when the debates were enlivened by the speeches of a Gladstone and a Disraeli, the press had been growing with the growth of liberal institutions, and had been recognised more and more by the Parliament of this country."

The distance daily walked by a country letter-carrier, irrespective of weather and the state of the roads, is frequently very great. The Braemar letter-carrier, who died at the close of George the Third's reign, had, during the thirty-six years that he held the office, walked 260,000 miles in the execution of his duties, which would give an average of rather more than twenty-three miles a day for the six days of the week. I was personally acquainted with a similar case in a midland county, where the distance accomplished by the letter-carrier each working day of the week was twenty-two miles from point to point, though often more than this, especially on the day when the local newspaper had to be delivered at various farmhouses. The effort that had been made to obtain him a day of rest on the Sunday was only partially successful; and on Sundays he had to walk sixteen miles, the greater portion of his route lying over a wild, hilly, and heavy country. The man was an old soldier who had served in India; he stood six feet two, was as upright as "a post," and gave the military salute when he passed any one, walking with a steady, long, swinging step. He had two enforced holidays every year, on the days when he drew out his small pension, but on these days he had to pay a substitute. During the five years of my acquaintance with him, I never knew him to have but one other "holiday," and that was on the day of his wife's funeral; she was a black woman, and they had a large family of various gradations of hue between black and white. When I tried to speak a word of comfort to him on his loss, he expressed his grief somewhat oddly:—"To think," said this old soldier letter-carrier, "that she should die and leave me after I had taken the trouble to bring her so many thousand miles." Great as were the pedestrian feats of this country letter-carrier, they were exceeded by those of William Brockbank, "the walking post" from Manchester to Glossop, in 1808, and previous to that, the letter-carrier from Whitehouse to Ulverstone. If we may credit the published statements of this man's walking powers, "his daily task was not less than forty-seven miles." When Mr. Edmund Capern was the letter-carrier at Bideford, Devon, he made good and profitable use of his long walks by his poetical compositions.

The poet Coleridge was once walking in the Lake district, when he saw a young girl who was servant at the village inn, reluctantly giving back to the letter-carrier the letter he had brought for her, because she was unable to pay for its postage. Coleridge paid the shilling, and gave her the letter; and when the postman

had gone, received her explanation, that his kindly-meant payment was useless, as there was no writing in the letter, but merely certain marks on its outside, which let her know that her mother was well. They were too poor to correspond at the cost of a shilling a letter. Another person, similarly circumstanced, used to address a newspaper to her mother, addressed "Mrs. Campbell" if she was well, and Mrs. "Campbell" if she was ill; which was, certainly, in the latter case, a very unsatisfactory communication. But we may judge from the existence of such cases, what a widespread blessing it must have been, when the penny-stamped letters were first distributed by the country letter-carriers.

MY FIRST CURACY.

CHAPTER VIII.—SOME PAROCHIAL EXPERIENCES—PREACHING—LECTURES.

I MUST confess that my first curacy was no sinecure; for, as I have before observed, during the last few years of the late vicar's life the parish had been much neglected. Accordingly we found that many things wanted setting on foot, and maintaining in efficiency when fairly floated. Under the zealous guidance of my fellow-workman—for my vicar was really a fellow-labourer—we originated, and in several instances carried out successfully, various different schemes for the temporal and, I hope I may add, the spiritual welfare of the inhabitants of the parish.

Our first aim was to endeavour to draw the parishioners more frequently and regularly to their church. I think that the new choir, about which I have already spoken, was one great means to this end. It gradually grew into popularity, and the pains taken by the vicar's wife and the other ladies I have mentioned, in regularly attending to and superintending the different practices of the choir, regardless of weather, reacted upon the attendance of the choir members and their friends.

The next change my vicar and myself set about was to greatly simplify our sermons. We tried to make them as plain and practical as possible, and enlivened them with as many illustrations as we could from scripture, and from nature and life. I am persuaded that, in general, preachers take far too much for granted as to the knowledge of their hearers in regard to religious truths. Next we also shortened our discourses, making them seldom to exceed twenty minutes in their delivery. For occasional services, or for audiences in towns, who can congregate round a chosen preacher, this time is, of course, short; but for an ordinary mixed audience, especially in the country, I think it enough.

My vicar was no advocate for extempore addresses, and I myself fully agreed with him in this respect, not having "the gift": but though we did not preach extempore, we both made a point of studying our sermons well, so that we really *preached* them, and not *read* them, in the pulpit.

I remember that when I preached my first sermon, nervousness made me elevate my voice too much for the size of the church. I heard two or three remarks upon this first sermon of mine. One of the farmers said "he should like his farm boys to have such a voice to scare away the birds from the young wheat." Another labourer thought "it was not bad for a journeyman parson." Not at all a misnomer for a curate, I thought, when I had this remark repeated to me afterwards. Such hints were useful, both as regards overcoming nervousness and managing the voice.

The first time that I baptized a child, also, my gravity

and fortitude received a somewhat violent shock. The infant in question was more than two years old, and in its struggles to free itself from my arms, it seized my spectacles and dashed them into the font, exclaiming, "I won't, I won't." Now this font was rather a deep one, and as, on account of my deficiency in sight, I could not see to finish the ceremony without them, nothing remained to be done, after I had baptized the crying and struggling child, and gladly returned him to his mother's arms, than to strip up my sleeve and fish for my spectacles until I found them, which happily I quickly did, and having wiped and adjusted them, resumed the service, which I concluded without further accident; but my composure was slightly ruffled, as the affair happened in the presence of a large congregation of grinning rustics, and the squire's pew was full of magnates from a neighbouring hall.

Another and more important accident once made me exceedingly uncomfortable for a time. I was going to preach in the evening at a town about ten miles off from my parish, and in a church where the service was "strictly rubrical," and where the attendance was exceedingly large. This same church had been entirely restored by the resident parishioners themselves, without any assistance from outside. The vicar was popular, but just at this time in a bad state of health; accordingly, as I was well acquainted with him, I volunteered to assist him occasionally in the evening.

On this particular night I had to set off rather hurriedly, having been detained at home by unexpected extra work. When I arrived at the vestry I felt in my pocket for my sermon-case, but, alas! it was not there, nor in the pocket of my great-coat. Now I knew that the vicar was an exceedingly nervous man, and of course totally unprepared to preach, as he naturally expected that I had everything ready. Being late, the choir were already robed when I entered; so, as it was time for service to commence, I just asked for a Bible, which was given me, and I saw the vicar stare at my unusual request, because I had always arranged that I should read the lessons whenever I preached. I made no reply to his inquiring gaze, but silently followed him out of the vestry, and as I did so I could feel the cold chill down my back; but I resolved that I would brave out the matter, and that the vicar should be put to no inconvenience.

Although I read the lessons, as I have stated was my allotted task, yet I managed to find a text and arrange an outline of a sermon. The season was Advent. I took for my text, "He shall judge the world in righteousness." The suddenness of Christ's return, the signs of that coming, the events, as far as scripture tells of that day, the judgment itself, the effects of the judgment, the necessity of preparation for it, and that now, because none can tell how soon it may begin, these topics formed the subject of my discourse. I certainly trembled as I knelt in the pulpit, but I did earnestly pray for assistance from on high, that the congregation (and it was a vast one) might not suffer through my carelessness in losing my manuscript. I feel sure that the prayer was heard. All fear left me after I read the words of my text; and then, remembering whose message I had to deliver, I was able to proceed, and for twenty minutes never faltered or hesitated for a moment. I had preached in that church several times before, but never previously extempore, so perhaps it was from this fact, added to the solemnity of the subject, and the earnestness of the preacher, that the congregation was fixed in deepest attention.

Although my vicar and myself did not deliver strictly

extempore addresses in the pulpit of the church, yet he wished me to give a sermon of this kind once a week, in a building which had been an old chapel in a distant hamlet of the parish. This sort of "irregular" service I am sure produced a good effect among the people; at least outwardly, for I know that the attendance was numerous, and the chapel always full.

From my own observation, I have come to the conclusion, that if the same clergyman, in a country village church, has to preach twice every Sunday, that a written sermon in the morning, and an address without notes in the afternoon, would be found to produce most efficient good among his parishioners. The circumstances of each man's parish must determine his arrangements, but if I ever am the incumbent of a parish, I shall certainly try the plan I here advocate.

Passing from sacred to secular addresses, I stated a few chapters back, that, with the consent of the vicar, I started some lectures, in order to counteract the silly superstitions of the people. Though the first which I delivered, upon the subject of the Reformation, was not so clearly understood by my audience as I could have wished, yet I am happy to say that the majority of those delivered by myself and other friends were generally successful. During the six winters I was in the parish, I myself wrote and delivered forty-seven lectures upon popular subjects. I will not weary the reader with a list of them, but I may add that the subjects included a wide range. In addition to these, others were delivered by several of the surrounding clergy, and by two of our resident farmers. But in case of a failure, such as the carriage conveying the lecturer being upset in our narrow lanes, I was always prepared to act as a kind of stop-gap. Lecturing upon secular subjects was not our worthy vicar's especial *forte*, but he very kindly and ably assisted us by his constant presence in the chair, and by his purse also, in hiring the various diagrams used to illustrate the different subjects of the lectures.

We generally wound up the evening's entertainment with a hymn and the National Anthem, the clergyman's wife presiding at her harmonium. Now the mentioning of this instrument reminds me of a very noble act of heroism performed by the vicar's wife herself. For a few Sundays, while the organ was undergoing repair, her private harmonium was removed from the vicarage and placed in the organ gallery. At this instrument she herself presided. One afternoon there was an unusually large congregation, the occasion being three funerals from one family. The people found great difficulty in finding a sufficient number of seats; the vicar's wife perceiving this, went down from the gallery to assist in obtaining the desired extra accommodation; just as she re-ascended the stairs, she slipped, and her leg was broken. This accident, happening at the top of the stairs, was not perceived by scarcely any one. In some way or other, with the greatest presence of mind, she managed to regain her seat at the harmonium; and my readers will hardly credit my veracity when I tell them, that after this painful accident, the vicar's wife actually not only played the whole of the appointed music on the instrument, using the remaining unbroken foot to move the bellows, but also led the singing in addition. The first intimation to her husband of the accident, was the sight of his wife's pony carriage at the church door, and herself being carried down the gallery stairs at the conclusion of the service. She withheld the knowledge of her fall from her husband, for she felt that, had he known it, he might have been so unnerved as not to have been able to perform his duty (I was away at the time). All honour be to such a wife!

Varieties.

THE AUTHOR OF "JAMES BRAITHWAITE, OR THE STORY OF A SUPERCARGO."—The Queen has contributed £100 towards the Kingston Testimonial Fund, which is promoted by the Duke of Manchester and other admirers of Mr. Kingston, the excellent writer of boys' books.—*Athenæum*.

GEOGRAPHICAL PRIZES AT PUBLIC SCHOOLS.—The Royal Geographical Society, on the suggestion of Mr. Francis Galton, Author of "The Art of Travel," have announced a series of prizes to be competed for in the chief schools of England, Scotland, Ireland. The first competition will take place in May, 1869, by examination papers sent down to the several schools, thirty-seven in number, as follows:—*English Schools*: Birmingham, King Edward's School; Brighton College; Cheltenham College; Clifton College; Dulwich College; Eton College; Greenwich, Royal Naval School; Haileybury College; Harrow; Hurstpierpoint; Liverpool College; *London*, Charter House, Christ's Hospital, City of London School, King's College School, Merchant Taylors', St. Paul's, University College School, and Westminster;—*Manchester School*; Marlborough College; Repton; Rossall; Rugby; Shoreham; Shrewsbury; Uppingham; Wellington College; Winchester.—*Scotch Schools*: Aberdeen Grammar School; Edinburgh Academy; Edinburgh High School; Glasgow High School.—*Irish Schools*: Ennis College; Enniskillen Royal School; Dungannon Royal School; Rathfarnham, St. Columba's College.

POST-OFFICE NEWSPAPER DEPARTMENT AT BERLIN.—In the convenient and economical transmission of newspapers and periodical publications, Prussia is superior to England and France. By sending an order to any post-office in Germany, newspapers, &c., are obtained promptly and for the publishing price. There are ninety clerks and porters employed in the office at Berlin. Paper and string cost annually £1,500; a bale of paper being used every day, as the newspapers are sent out entirely covered. The work of the evening dispatch begins at four o'clock, and lasts till ten; that of the morning begins at one a.m., and closes at seven a.m., for which there are two different sets of clerks. During the day there are all the alterations in the registers of the orders to be made. In one room of the large building, German newspapers are received; in another, German periodicals of all sizes; in a third, newspapers and periodicals from Switzerland, Holland, Belgium, Denmark, Sweden and Prussia are received, whether destined for the interior, or sent from any one to any other of those countries; in a fourth, parliamentary despatches are wrapped up and addressed to the deputies.

BEER FOR FOREIGN PARTS.—British beer finds its way to almost every part of the known world. The export list for the year ending with October last shows that it was shipped from this kingdom for all parts of Europe and America, for South Africa and Western Africa, for Morocco, Syria, and Palestine, China, Persia, Java, Madagascar, Cape Verde Islands, and various islands in the Pacific. To India were shipped in the year 170,504 barrels, of the declared value of £499,033; to Australasia 111,839 barrels, of the value of £461,029; to the British West Indies 27,377 barrels, to the United States 19,856 barrels, to British North America 7,588 barrels, to Brazil 19,727 barrels, to the Argentine Confederation 13,964 barrels, to Chili 12,551 barrels, to Uruguay 11,578 barrels, to Peru 7,392 barrels. The largest export for Europe was to France, 14,418 barrels. The total export of the year, though not equal to that of 1865 or 1866, amounted to 525,619 barrels, of the declared value of £1,960,053.

CROSS PURPOSES.—Many years ago a man named Cameron, who was employed at the George Hotel, Kilmarnock, Scotland, left for Australia. For many years he did not hear from, or had not written punctually home. At last, when he did so, it seems that his wife, instead of replying by letter, at once set off for Gladstone, Queensland, from which place he had written. The steamer in which she came to Gladstone passed a steamer in which he was leaving Gladstone for Sydney. From Sydney she followed her husband to Melbourne. Not hearing from his wife, Cameron went home to find his daughter in the hands of their friends, a grown-up child of twelve years. He at once returned to Australia in search of his wife, Jane Murdoch Cameron, but they had not met since. We insert this at Cameron's urgent request, and in the hope that it will meet the eye of somebody who may know something of Mrs. Cameron's fate.—*Queenslander* (Brisbane).

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper*.

TRADING IN JAVA.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XIII.

I WAS very sorry to have to part from my brother William, and not a little so from that merriest of merry midshipmen, Toby Trundle.

"We shall meet again one of these days, Trundle," I said, as I warmly shook hands with him. "I hope it will be in smooth water too, we have had enough of the rough together."

I did my best to express to the captain and officers of the *Phoebe* my sense of the kindness with which they

had treated me from the first moment I had stepped on board their frigate to the last. We all sailed together, the men-of-war and their prizes to proceed to the Mauritius, then to refit and get ready for the expedition to Java. We also were bound for Java, but intended first to visit Antongil Bay for the purpose of trading with the natives. I was pleased to find myself among my old shipmates again. They had had no sickness on board, and not a man had been lost. The officers were the same in character, while their individual peculiarities seemed to stand out more prominently than before. We found the natives at Antongil Bay very honourable

in their dealings. Many of the chiefs spoke French perfectly well, and looked like Frenchmen. They were, we found, indeed, descendants of some of the Count Benyowsky's followers who had married native women. The children of such marriages were generally highly esteemed by the natives, who had raised them to the rank of chiefs. From what I saw of all classes of the natives of Madagascar, but especially of the upper ranks, I should say that they were capable of a high state of civilisation, and I see no reason why they should not some day take their place among the civilised nations of the east. When that time will come it is impossible to say. Neither adventurers, like the brave and talented Benyowsky, nor French settlements will bring it about. One thing, indeed, only can produce it—that is, the spread and the firm establishment of true Christianity among the people. Some days after our departure we had a distant view of the island of Rodriguez. In about a fortnight afterwards we were glad to put on warm clothing instead of the light dress suitable to the tropics; yet we were only in the same parallel of latitude as Madeira. It showed us how much keener is the air of the southern hemisphere than that of the northern. We soon after fell in with the monsoon, or trade wind, which sent us flying along at a good rate, till early in August, on a bright morning, the look-out at the masthead shouted at the top of his voice, "Land ho! Land ahead!" It was the north-west cape of New Holland, or Australia, a region then, as even to the present day, almost a terra incognita to Europeans. As we neared it, we curiously looked out with our glasses for some signs of the habitations of men, but nothing could be seen to lead us to suppose that human beings were to be found there. The shore was low, sandy, and desolate, without the least intermixture of trees or verdure. A chain of rocks, over which the sea broke furiously, lined the coast. We continued in sight of this most inhospitable-looking land till the next morning. I could not help thinking of the vast extent of country which intervened between the shore at which we were gazing, and the British settlement at Port Jackson, of which we had lately heard such flattering accounts. Was it a region flowing with milk and honey? one of lakes and streams, or of lofty mountains? did it contain one vast inland sea, or was it a sandy desert of burning sands, impassable for man?

This was a problem some of my emigrant friends had been discussing, and which I longed to see solved. After losing sight of the coast of New Holland, we had to keep a bright look-out, as we were in the supposed neighbourhood of certain islands which some navigators, it was reported, had seen; but no land appeared. One clear night we found ourselves suddenly, it seemed, floating in an ocean of milk, or more properly, perhaps, a thick solution of chalk in water. The surface was quite unruffled, nor was there the slightest mixture of that phosphoric appearance often seen on a dark night when the sea is agitated. The air was still, though it was not quite a calm, and the sky was perfectly clear. It took us some hours to slip through it. We drew up some in buckets, and found it to contain a small, scarcely perceptible, portion of a fine filamentous substance, quite transparent, such as I have occasionally seen where seaweed is abundant. Whether this was the cause of the milky appearance of the sea or not, we could not determine. We were now sailing almost due north, for the Straits of Bally, as the passage is called between that small island and the east end of the magnificent island of Java. About the middle of August, early in the morning, again land was seen from the masthead, and

in a few hours we entered the straits I have just mentioned. We could see the shores on both sides, that of Bally somewhat abrupt, while the Java shore, agreeably diversified by clumps of cocoa-nut trees and hills clothed with verdure, looked green and smiling, contrasting agreeably with that of New Holland, which we had so lately left. A large number of small boats or canoes were moving about in all directions, those under sail going at great speed. They were painted white, had one sail, and were fitted with outriggers. We had to keep a bright look-out lest we should run suddenly into the jaws of any French or Dutch man-of-war, which, escaping from our cruisers, might be pleased to snap up a richly-laden merchantman like the *Barbara*. We could not tell at the time whether the proposed expedition had arrived, or, if it had, whether it had been successful. As we were coasting along, a hill appeared in sight, early in the morning, the summit thickly surrounded by clouds. As this nightcap of vapours cleared away, a remarkable cone was exposed to view, the base covered with the richest vegetation. Soon after this we got so entangled among clusters of rocky islands and coral reefs, that we were very much afraid we should be unable to extricate ourselves, and that our ship would get on shore. Though there was not much risk of our losing our lives, the dread of having our ship and cargo destroyed was enough to make us anxious. Fortunately the wind fell, and by keeping look-outs at each fore yardarm and at the masthead, we were able to perceive the dangers with which we were surrounded before we ran on any of them. At length we got into seemingly more clear water, but there being still several reefs and islands outside of us, Captain Hassall thought it prudent to anchor for the night. The shore off which we lay was lined with cocoa-nut and other palm trees, rivulets were seen flowing down the sides of the hills, which were clothed with spice-bearing and other shrubs, the whole landscape presenting a scene of great tropical beauty.

"If I ever had to cast anchor anywhere on shore, that's the sort of country I should choose, now," observed Benjie Stubbs, our second officer, who had been examining the coast for some time through his glass.

"I wouldn't change one half-acre of any part of our principality for a thousand of its richest acres," said David Gwynne, our surgeon, to whom he spoke. "Poets talk of the spicy gales of these islands; in most cases they come laden with miasma-bearing fevers and agues on their wings; while if a fellow has to live on shore, he gets roasted by day with a good chance of a sunstroke, and he is stewed at night, and bitten by mosquitoes and other winged and crawling things, and wakes to find a cobra de capella or green snake gliding over his face."

"Oh, a man would soon get accustomed to those trifling inconveniences as the natives must do; and money goes a long way in these regions for all the necessities of life," answered Stubbs.

I must confess that lovely as I had heard are many parts of those eastern isles, I was inclined to agree with the surgeon.

It was discovered this evening that in consequence of the heat, or from careless cooping, our water-casks had let out their contents, and that we had scarcely any fresh water in the ship. At Batavia it was very bad, and it might be some days before we should get there, or we could not tell when, should the expedition not have succeeded. It was therefore necessary to get water without delay, and as a river was marked on the chart near to where we lay, we agreed the next morning to go up, and, should we see no fort, to run in and obtain water

and any fresh provisions we might require. Accordingly we weighed by sunrise, and, standing in, ran along the coast till we arrived off the mouth of the river we hoped to find. Some native houses were seen, but no fortifications and no buildings of an European character. We therefore thought that we should be perfectly safe in going ashore. On dropping our anchor, several canoes came off laden with turtles, ducks, fowls, cockatoos, monkeys, and other small animals and birds; besides sweet potatoes, yams, and other vegetables, grown by the natives for the supply of the ships passing along the coast. They found plenty of customers among our men, and the ship was soon turned into a perfect menagerie. We without difficulty made the people in the canoes understand that we wanted to replenish our water-casks, and we understood them to say that they would gladly help us. Two boats were therefore lowered and filled with casks; Stubbs took charge of one of them, and I went in the other, accompanied by little Jack Hobs, intending to exchange a few articles which I took with me suitable to the taste of the natives for some of the productions of their country. As we pulled up the river we saw the low shores on either side lined with houses built on high piles, by which they were raised a considerable distance above the ground, some, I should think, fully twenty feet. The only means of entering them was by a ladder, which we found it was the custom of the inhabitants to lift up at night to prevent the intrusion of strangers, but more especially, I should think, of wild beasts. The chief object, however, of their being built in this way is to raise them above the miasma of the marshy ground, which often rises only two or three feet. They were all on one floor, but had numerous partitions or rooms. The roofs, which were covered with palm leaves, projected some distance beyond the walls, so as to form a wide balcony all round. The ground beneath was also in many instances railed in, and thus served for the habitation of ducks, poultry, and cattle.

At the landing-place some way up a number of natives were collected who received us in a very friendly way. We saw no Dutchmen nor other Europeans; as we could not make ourselves understood by the natives, we were unable to ascertain what had occurred at the other end of the island. The men in the canoes had for clothing only a cloth round their waists, but the people who now received us were habited in a much more complete fashion. They wore the *sarung*, a piece of coloured cloth about eight feet long and four wide, part of which was thrown over the shoulder like a Highlander's plaid, the rest bound round the waist serving as a kilt. They all had on drawers secured by a sash, and several wore a short frock coat with buttons in front, called a *baju*. All had daggers, and several, who were evidently people of some consequence, had two in copper or silver sheaths. The latter had their teeth blackened, which was evidently looked on as a mark of gentility. They also wore turbans, while the lower orders only had little caps on their heads. The watering-place was some little way up the river, and while the mates proceeded there with the boats, I landed at the village or town. I had not proceeded far when I was given to understand that a chief or some person of consequence wished to see me for the purpose, I supposed, of trading. His habitation was pointed out to me on the summit of some high ground at a distance from the river. It appeared to be far larger than the houses of the village. Without hesitation I set off, followed by Jack, and accompanied by several of my first acquaintance, towards it. I now more than ever regretted having lost O'Carroll, for understanding as he did the languages of the people of the

Archipelago, he would greatly have facilitated our proceedings. The house or palace of the great man was surrounded, as are all the island habitations of every degree which I saw in Java, with gardens. We entered on the north side into a large square court, on either side of which were rows of Indian fig-trees, with two large fig-trees nearly in the centre. Passing through this we found ourselves in a smaller court, surrounded by pillars and covered in by a light roof. Here most of my companions remained, but I was conducted up a flight of steps to a handsome terrace in front of a building of considerable size, in the centre of which was a spacious hall, the roof richly painted with red and gold. This hall of audience was on the top of the hill, steps from it led down to other houses which composed the dwelling of the chief and his family.

As I looked down from the terrace, I could see the tops of the houses of the poorer class of people, which surrounded the palace of the chief. They were all in the midst of gardens, and had walls round them. I found indeed that I was in the centre of a town, or large village, though in coming along I had scarcely seen any habitations, so completely shut in were they by trees and shrubs. I had thus an example of the fertility of Java, and of the industry of its inhabitants. With regard to the habitations of the barbarians whose lands I visited, I must observe that, though there were exceptions to the rule, they were generally far superior in respect to the wants of the occupants, than are the dwellings of a large number of the poorer classes in Scotland, and especially in Ireland, and in some districts even in England. They are in good condition, clean, sufficiently furnished, and well ventilated. Granted that the materials of which they are built are cheap, that from the fertility of the land a man by labouring three days in the week can supply all his wants for the remaining four, and has time to repair his house and furniture, and that he has no rates and taxes to pay, still I cannot help believing that there is something wrong somewhere, that God never intended it to be so, and that it is a matter it behoves us to look to more than we have done. Though distance seemed to increase my love for Old England, it did not blind me to her faults, and I often blushed when I found myself among heathen savages, and saw the superiority of some of their ways to ours. These or similar thoughts occupied me while I stood on the terrace gazing on the fine prospect around and waiting for the appearance of the chief. After some time the chief appeared at the entrance of the hall of audience, with a gay coloured umbrella borne over his head, a slave carrying the indispensable betel-box by his side, a handsome turban on his head, and his sash stuck full of jewel-hilted daggers with golden scabbards, while all his attendants stood round with their bodies bent forward and their eyes cast to the ground, as a sign of reverence. I thus knew that I was in the presence of a very important person. I was rather puzzled to discover who he took me for, that he treated me with so much state. How we were to understand each other and I was to ascertain the truth I could not tell. I think I mentioned that I learned a little Dutch, which I had practised occasionally with Peter Kloops, my old cousin's butler.

I tried the chief with some complimentary phrases in that language, but he shook his head; I then tried him with French. He shook his head still more vehemently, and from the signs he made, I thought that he was annoyed that I had not brought an interpreter with me. After a time, however, finding that he could get nothing out of me, he said something to one of his attendants,

who, raising his hands with his palms closed till his thumbs touched his nose in rather a curious fashion, uttered a few words in reply, and then hurried off by the way I had come. I was after this conducted into the hall, where on a raised platform the chief took his seat, making signs to me to sit near him, his attendants having done the same. Slaves then brought in some basins of water, in one of which the chief washed his hands, I following his example. Trays were then brought in with meat and rice, and fish, and certain vegetables cut up into small fragments. There were no knives, or forks, or spoons. The chief set an example which I was obliged to follow, of dipping his fingers into the mess before him, and, as it were, clawing up a mouthful and transferring it to his mouth. Had his hands not first been washed, I certainly should not have liked the proceeding, but as I was by this time very hungry, and the dishes were pleasant tasted and well cooked, I did ample justice to the repast.

The chief and his attendants having eaten as much as they well could, my young attendant Jack, who sat somewhat behind me, having done the same, water was again brought in that everybody might wash their hands.

I heard Jack Hobs in low tone give rough colloquial expressions of his satisfaction. "They don't seem much given to talking though," he added to himself. "I wonder whether it is that they think we don't understand their lingo, or that they don't understand ours; I'll just try them though."

Whereon in a half whisper he addressed the person sitting next to him, who bowed and salaamed very politely in return, but made no reply.

"What I axes you, mounseer, is, whether you feels comfortable after your dinner," continued Jack in a louder whisper. "And, I say, will you tell us who the gentleman in the fine clothes is, for I can't make out nohow? Does he know that my master here is a great merchant, and that if he wishes to do a bit of trade, he is the man to do it with him?"

The same dumb show on the part of the Javanese went on as before. Jack's attempt at opening up a conversation was put a stop to by the return of the servant with dishes containing a variety of vegetables and fruits, which were as welcome, probably, to him as to me. One dish contained a sweet potato cooked. It must have weighed from twelve to fifteen pounds. I have heard of one weighing thirty pounds. The natives appeared very fond of it. We had peas and artichokes and a dish of sago, the mode of obtaining which I afterwards saw, and will describe presently. I heard Jack cry out when he saw one of the dishes of fruit. It was I found the *durian*, a fruit of which the natives are very fond, and which I got to like, though its peculiarly offensive odour at first gave me a dislike to it. It is nearly of the size of a man's head, and is of a spherical form. It consists of five cells, each containing from one to four large seeds enveloped in a rich white pulp, itself covered with a thin pellicle which prevents the seed from adhering to it. This pulp is the edible portion of the fruit. However, a dish of *mangostins* was more to my taste. It is one of the most exquisite of Indian fruits. It is mildly acid, and has an extreme delicacy of flavour without being luscious or cloying. In external appearance it resembles a ripe pomegranate, but is smaller and more completely globular. A rather tough rind, brown without, and of a deep crimson within, incloses three or four black seeds surrounded by a soft, semi-transparent, snow-white pulp, having occasionally a very slight crimson blush. The pulp is eaten. We had also the well-known Jack-fruit, a great

favourite with the natives; and the *champadak*, a much smaller fruit of more slender form and more oblong shape. It has a slightly farinaceous consistency, and has very delicate and sweet flavour. I remember several other fruits; indeed, the chief seemed anxious to show to me, a stranger, the various productions of his country. There were mangoes, shaddocks, and pine-apples in profusion, and several other small fruits, some too luscious for my palate, but others having an agreeable sub-acid taste.

We sat and sat on waiting for the return of the messenger. I observed that whereas a calabash of water stood near the guests, from which they drank sparingly, a jug was placed close to the chief, and that as he continued to sip from it his eyes began to roll and his head to turn from side to side in a curious manner. Suddenly, as if seized with a generous impulse, or rather having overcome a selfish one, he passed the jug with a sigh over to me, and made signs that if I was so inclined I was to drink from it. I did so without hesitation, but my breath was almost taken away. It was the strongest arrack. I could not ascertain how the chief, who was a Mohammedan, could allow himself to do what is so contrary to the law of the prophet. I observed that his attendants looked away when he drank, as they did when I put the cup to my lips; so I conclude that they knew well enough that it was not quite the right thing to do. All the inhabitants of Java are nominally Mohammedans, but in the interior especially, a number of gross and idolatrous practices are mixed up with the performance of its ceremonies, while the upper orders especially are very lax in their principles. Most of them, in spite of the law of their prophet prohibiting the use of wine and spirits, drink them whenever they can be procured. The rich have as many wives as they can support, but the poor are obliged to content themselves with one. I should say that my host, when I returned him the jar of arrack, deprived of very little of its contents, gave a grunt of satisfaction, from which I inferred that his supply had run short, and that he was thankful that I had not taken more. I kept anxiously waiting all the time for the arrival of an interpreter, for whom I was convinced the chief had sent. After we lost Captain O'Carroll we returned to our original intention of procuring one at Batavia. This must account for my being at present without one. I had come on shore in the hope that I might make myself sufficiently understood to carry on a trade by means of signs, as I knew was often done. As, however, my new friends would not make the attempt to talk by signs or in any other way, I had to wait patiently till somebody should arrive to help us out of our dilemma.

MOTHER'S WORK;

OR, THE EDUCATION OF THE HEART.

BY MRS. ELLIS, AUTHOR OF THE "WOMEN OF ENGLAND."

CHAPTER IV.—COURAGE, MORAL AND PHYSICAL.

LOOKING at the prevailing tone of society, it would appear, on a superficial view, that never was courage, or rather *daring*, more fashionable than in the present day. Many of the outward characteristics of absolute *boldness* are now stamped even upon the young and the fair of the gentler sex—upon their dress, their mode of speech, their amusements, and their habits of life; while in accordance with this manifestation of taste, the *éclat* of having accomplished a daring exploit would seem to be a crowning glory with others.

It is of little use for those who think and act more

rationally to speak with contempt of the folly of any particular course which fashion or public taste may be taking. While they sit apart, exempt from the folly themselves, the tide sweeps past them, gathering its thousands as it goes, and they are left alone, or left, perhaps, to the brotherhood of a few moralising sages, whose voices of reproof are unheeded by the hurrying throng.

The setting in of this tide of public taste—for one cannot call it opinion—has, doubtless, some origin deeper and more serious than its outward manifestation would seem to indicate.

No one item of that which goes to make up the prevailing tone of public taste in these matters has sprung up of itself, or is now existing alone. A single specimen of any extreme of fashion struck off in a moment by individual fancy would excite ridicule, and sometimes horror. But these things grow, combine and swell, and flow in one direction until a certain uniformity of character is produced, such as in the present day, I think, may be fairly designated the bold.

Much, then, might be supposed to be gained on the side of moral as well as physical courage by this tone of public taste, only that boldness does not always spring from courage. There is a boldness which arises from absence of feeling, from ignorance of how much is risked, from weakness rather than strength of intellect; just as a child, or a very ignorant person, might mount a vicious horse. This would be boldness, but there would be no real courage in the act, because the rider would be ignorant of the skill required in managing such a horse, and of the almost certain disaster that would ensue. Courage only deserves the name when the danger is seen and understood, the risk appreciated, and when the object to be gained is considered worth what both are estimated at.

A bold look and manner have become almost as proverbial as the mask worn by cowardice. Such are the signals hung out by the bravado. Real courage makes no sign. It hides its time; but the occasion finds it always prompt and willing.

The extremes of fashion and of public taste are subject to the general law of excess and reaction. Within the recollection of many of us, the fashion for women was to be delicate and sentimental, while a dandyism displayed itself in the other sex which might assume any extreme except that of being too manly. We have certainly a great advantage in having got rid of these, and with them a large amount of affectation not very likely to find a place in public favour for some time to come. Indeed it would be ungrateful not to recognise, in the tone of social feeling and manner in the present day, the absence of affectation both in literature and conversation.

This present extreme of boldness may, no doubt, be in some measure attributed to reaction; but there is another cause working at the root of our social tendencies of a much more serious nature. It is that hunger and thirst for emotional sensation which, I believe, has much to do with the dashing air, and the general readiness for action, especially for enterprise, which the bold look of our youth would seem to indicate. That sensational writing which is so often and so justly complained of is, I think, the result rather than the cause of this tone of mind and habit, though both work together in producing the manifest effects.

It requires but little acquaintance with the youth of the present day to see that sensation is the thing most desired. Respectable society does not afford the excitement of base and hideous crime, consequently those who pine for this luxury must seek it in books; and the fre-

quent reading of such books not only produces an unhealthy appetite for more, and for worse, but it naturally produces also a general indifference to the heinousness of crime, and a boldness in discussing topics of this kind without a shudder, such as can scarcely fail to produce boldness in general—boldness in conversation, looks, and manner.

So far as boldness can be made to do good service, the mother has certainly this instrument ready to her hand in the training of her child. But, as already said, boldness is not courage; and besides this, there are two kinds of courage—courage in acting, and courage in enduring. It is for the latter that moral courage is most needed; and it is under circumstances requiring this kind of courage that we find the truest heroism.

The extent to which modern civilisation has reached in providing indulgences for the body, and amusements for the mind under every condition of life, would seem to have left but little need for the exercise of our powers of endurance, only when aroused by those calamities which not unfrequently cross the path of luxury, and make shipwreck of abundance; and these are indeed such as make strong demands upon the moral courage of all classes of society.

That peculiarity of character which gives the stamp of indomitable energy to the English as a nation gives also to individuals a large amount of restlessness, and even discontent, under circumstances of continued inaction. Excess of luxury does not operate as a sedative; rather the contrary, as the history of nations or peoples far gone in a state of personal indulgence sufficiently proves. Hence, out of an extreme amount of bodily ease and convenience, where the means of enjoyment without effort are more than abundant, there arises an unsatisfied want which nothing but action can really supply.

On the other hand, excessive work, or strain of one particular kind, as certainly excites a desire to rush off, during the moments of relaxation, to something entirely different in its nature from that which constitutes the daily employment of the hard worker. It may be that the powers of calculation alone have been exercised during many hours of the day, or the attention may have been fixed upon some fine or difficult mechanism from morning till night, and from day to day. But this is not enough for the human worker. He has other faculties living and throbbing within him, and all demanding food and exercise. Man is not a machine, nor yet a horse or a mule, that he can be driven to his daily task, and kept for ever within a narrow round of unchanging toil without some rebellion of the heart, some outburst of those feelings which make up the natural life of man. Long habit, or the weariness of a life of constant toil, may bring him to this; but youth, especially educated youth, must have something, either in real life or in fictitious representation, to excite emotion, to touch the dormant affections, and to stir the stagnant blood.

Hence, whether in a condition of inaction, or in one of overstrained action—the two extremes into which society may now for the most part be divided—there is the same want. To the idle and luxurious there is that which Byron so well described as his own case, the “want of something craggy to break upon;” to the busy and over-worked class there is the want of scenes and events, whether real or imaginary, in which passion is displayed in rapid, forcible, and even tremendous action.

How to prepare a child, whether boy or girl, for this state of society is, indeed, a serious question; and yet it

must be done, and done by the parents or those who act for them. Other educators will think they do well if they sharpen and excite to the highest working pitch those faculties which will be wanted in after-life, in order to help forward this system of rapid progression. Or they will think they do well with the non-working class if they go on with the old routine method which has so long been considered the best, indeed the only kind of education for ladies and gentlemen. But the satisfaction which such teachers may derive from a faithful performance of their task after this fashion can have nothing to do with the parents' duty—the parents' higher, holier, happier task—in educating the heart of the child, in making the home a school for the education of the heart, so that it shall receive impressions day by day, and hour by hour, which will insensibly strengthen into principles of conduct. In this way the teaching of the parents will make the real character, while the teaching of others will only sharpen the faculties of that character for action.

Out of all this apparent confusion arises a distinct need for moral courage. How many a miserable defaulter would never have laid his hand upon the money that was not his own if he had not been living beyond his means, from want of moral courage to let his friends, his neighbours, and the world know that he was poor. How many a family has been brought into disgrace, and covered with reproach, in consequence of the father not having sufficient moral courage to tell his wife and children that he was a bankrupt. Nay, how large a portion of the severest calamities of life are attributable to this want: the ruined confidence—the broken trust—affection alienated, and wounds inflicted, which nothing in after-life can ever heal.

On the other hand, how much of that which we esteem as most noble in human character and conduct, upon which we most rely as safe and sure, arises out of the right exercise of moral courage. Christian life especially demands this—to stand and to stand fast—to fear nothing that man can do—to be established on a rock, and amid all the billows and storms of this uncertain world, to have the unshaken confidence which hears only the prevailing voice—"It is I, be not afraid."

In the whole course of human life, with its insidious temptations, its startling changes, and its disastrous events, there is nothing more needed by youth than moral courage. This can only be attained through the concurrence of various causes, and the application of various means. I am not speaking of a constitutional courage, which may be either moral, or physical, or both. In many cases this courage is the natural result of a small degree of sensibility to pain. The child who is extremely sensitive to pain may have quite as much natural courage as the other, but he does so dread the pain that would be likely to follow his courageous act, that he hesitates, and perhaps shrinks from doing it.

In this way lamentable mistakes are sometimes made in the treatment of the young, especially at school, where there is little time or opportunity for personal acquaintance with individual character, or for the application of a different kind of discipline to any peculiar case. The sensitive child, under terror of consequences, is sometimes tempted to deceive—it may be to tell a lie, though at the same time hating deception and falsehood as much, perhaps more, than the boy who has not the same amount of natural sensitiveness to suffering and pain.

Even as regards bodily pain, there is reason to believe that certain constitutions suffer much less from the same cause than others. It is not always because of

greater fortitude that an operation is borne with less appearance of distress by one person than by another. The weaker cases, both of mental and bodily conformation, are peculiarly those which demand early and judicious management in the education of the heart, as carried on at home.

But the excessive devotion of a tender-spirited mother not unfrequently defeats her own purpose, by substituting the ease or enjoyment of the present moment for the ultimate welfare of her children. It requires, indeed, a considerable amount of moral courage, on the part of the mother, to cultivate moral courage in her child. If the courage of endurance be the object to be attained, the child must learn to wait—perhaps to suffer—that is, to suffer a smaller evil for the present, for the sake of a greater good in the future. How can the tender mother bear to see such suffering, especially when the means of alleviation are so abundant, and when a thousand amusements or inventions for the distraction of thought are within her reach?

Physical courage, as already said, belongs chiefly to the animal part of our nature, and depends very much upon bodily structure, or upon certain physical conditions—such as health or disease. To feel habitually the want of physical power, will naturally and reasonably produce a want of physical courage; while, on the other hand, robust health, and a strong muscular frame, will as naturally produce courageous action. Where this kind of courage exists in a high degree, the work of the educator will be that of directing to its proper and to noble uses. It is a powerful engine, and may do great harm, or it may do great good. In the common uses which occur in ordinary life, it may relieve in distress, assist in difficulty, rescue from oppression, and, in short, render many of those acts of service to humanity for which opportunities are continually offering to those who are both able and willing to be useful. It will also, on behalf of its possessor, give strength to his arm, certainty to his tread, and energy to his action, wherever a great enterprise has to be undertaken, or a work of difficulty and danger steadily carried out. When this great agent, combining bodily strength and physical courage, has never been disciplined, or directed to laudable purposes, it degenerates into audacity, insolence, or worse.

This useful instrument, the animal courage of her child, the mother may cultivate where it is deficient, by many combining means. Open-air exercises, especially riding—being entrusted with the care of animals, so as to take part in tending and managing them—being often placed in new circumstances, and called upon to help others, rather than made the receiver of help; but especially, being taught, in all cases of extraordinary venture, that the end is worth the risk: these, and a thousand other means, all tending to the accomplishment of her purpose, will occur to the mother who is bent upon making her children brave, and who is herself convinced that the personal ease or comfort of the passing moment is of very little value in comparison with the gaining of that great good; for it is a great good, both to men and women, to be truly brave—brave in a right cause.

After all, it is just the keeping of some desirable end in view, which will prove the surest means of promoting both moral and physical courage. A brave man does not stop to remove all the obstacles that lie in his way. He marches over them—tramples them down as dust beneath his feet. He does not even see them as a coward would, because his eye is fixed upon the point which he is bent on gaining. Even the delicate woman

knows no fear when her affections bear her on, through otherwise appalling dangers, towards some object dearer to her than life. It is the point to be gained—the object—the end which makes the true courage; and in this direction the mother's work lies open to her hand.

It is not an easy work. Perhaps no truly great work is easy; but it is a glorious work, because it consists in forming a true estimate in her own mind of what is really worth doing and daring. The education of the head must help here, as indeed it must always, otherwise the daring of the child may grow into a vague or wild enthusiasm. It may rush upon impossibilities, and so make shipwreck of power. The head must make the necessary calculations as to time and means, relative circumstances, and probable results; but the heart must be at work as well. It must be forcibly impressed, nay, absolutely filled, with desire after the object to be attained. It must admire it—love it—live for it.

No mere instruction in the way of what we understand by learning or intelligence can ever awaken this intense feeling. It arises out of quite a different portion of human character—out of that which I have called the heart, because of its vital warmth, its fervour in the contemplation of a good action, or in the conception of a grand idea. It is that which answers, "Let me go," when there is a proposal for rescuing the oppressed; or, "I will come and help," when there is a cry of suffering; or it acts and makes no sign, except by flashing eye and firmer tread, when there is a gulf of danger to be passed, and a chance, a hope, that safety for many may be secured by the risk of one.

It seems to me that all the greatness of which our nature is capable arises out of a proper estimate of what is great, and what is little, in human life. And what a glorious lesson is this for the mother to employ herself in teaching!—most glorious when it embraces eternity as well as time.

A moral courage formed upon this basis, even though imperfect in itself and in its operations, because of our imperfect perception of what is essentially best, would be the greatest boon which parental teaching, enforced by home influence, could bestow upon a child—a courage that would strengthen him to do right, and to dare the consequences, esteeming them as nothing in comparison with the doing the will of his Father in heaven. This is the martyr's courage. Only with us it is wanted for the common grovelling, unostentatious affairs of daily life, that we may be as brave when called upon for an act of simple honesty—for standing by the down-trodden and despised—for denying ourselves that we may help those who are more needy—for speaking the truth before God and man—for upholding the right, and doing it—as brave as if we were led forth a public spectacle to perish at the stake.

There are many martyrdoms in this life besides that of burning. There are martyrdoms alike unpitied and unseen. No memorial marks the spot where the heart alone has bled, where the spirit, not the body, has rendered up the sacrifice. For such, there must be a preparation, and not less so for walking silently and unobtrusively amongst mankind after the ministry of suffering has been sealed.

These, however, are things for the mother to ponder in her own heart. It would not only be unwise, but cruel, to begin the education of a child otherwise than with bright and happy prospects. Living in a moral atmosphere of healthy enjoyment is one of the surest means of promoting the growth of a healthy moral courage. A diseased mind is seldom consistently

courageous. It has its seasons of misgiving—of suspicion—of uncertainty; but a happy youth, knowing no fear but that of doing wrong—enlivened by hope—cherished by kindness—always encouraged—this is the kind of nurture most likely to promote the growth of a steady, consistent, and noble courage.

As the bodily frame is made strong and vigorous by healthy exercise under general circumstances, by boisterous and exultant play, by laughter and merriment, and by ten thousand happy means of deriving enjoyment from familiar and wholesome sources, so it is being prepared in the sunshine for meeting the storm without flinching whenever it may come. Thus the heart of youth should be kept cheerful, the feelings buoyant, and hope ever on the wing. The world will do the work of repelling and repressing. The opposite work should be done at home, and if possible it should also be done at school. In education generally, there should be less repression, and more incitement, than we often find—less *don't*, and more *do*.

Indeed, the moral training of the young is almost universally regarded too much in a negative point of view—too much as a system of avoidance. Intellectual training is conducted in a positive manner. The intellect is stimulated—helped forward—tested in its progress and attainments—practised over and over again in doing what has to be done well, until a higher degree of excellence is attained—conducted onward, step by step, as strength and capability increase, and then openly rewarded.

If the training of the heart, with all its treasury of motives and desires, were conducted upon this plan, who shall say what beneficial results might not ensue? especially from holding always before the eyes of youth great and glorious purposes—purposes of moral worth, instead of those of merely material value. The world is perpetually holding up the latter, with every enticement which worldly wisdom, society, fashion, and public taste can devise. The world is ever holding out its promise of wealth, of personal indulgence, of influence, honour, and fame. There is this vast and widespread power to work against, when we try to set before the eye of youth a higher standard of excellence—a class of objects and purposes more worthy of pursuit. We have then to speak of the unseen—the immaterial; and to some extent the unregarded, such as kindness, generosity, truth, honesty, and we have to invest these with a certain kind of glory, in order to make them supremely attractive.

No single individual striving ever so faithfully can do this to the extent which the necessity now existing for a higher standard of morals so urgently demands; because the force of public opinion, when not only spoken, but acted out in all the transactions of daily life, is the greatest of all human forces, and this, as already said, is engaged on the side of material good as the highest, or rather the most to be desired.

But if no single individual working alone can do this, each can do their part. A combination of mothers, parents, enlightened educators—enlightened in the highest sense—might surely bring about a happy change by working at the root of the whole matter—the true foundation of character.

And that such work will be owned and blessed of God, there can be no cause to doubt, because it is not only in accordance with his will, but, in the hands of Christian parents, it is guided by continual reference to that will. It is a blessed thing to work expressly with means which he has himself put into the parent's hand for the holiest uses and the highest ends. To

this work we do not bring any instrument which is unfit for Christian service after conversion of the heart to God. Kindness will be wanted then, and love, to exemplify that union which Christ has made the test of discipleship with him, and obedience to his commands. Truth will be wanted then, to keep inviolate the majesty and purity of God's holy law; and courage will be wanted then, to fight the Christian warfare with unflinching faith, and to walk with steady purpose of soul through all the trials and temptations of this mortal life.

ASTRONOMICAL NOTES FOR SEPTEMBER.

IN September, 1868, the principal planets are all favourable objects for observation, some in the evening, others in the morning hours. At midnight Mars and Jupiter are the only two above the horizon, Jupiter being conspicuous near the meridian, and Mars just rising in the north-east. Mercury is too near the sun this month to be observed with the naked eye, or even with a telescope, unless under very favourable circumstances. On the 1st he sets about a quarter of an hour after the sun, this interval being increased to a half an hour on the 31st.—Venus is a splendid morning planet in the north-east before sunrise. She is at the beginning of the month in Cancer and afterwards in Leo. She rises on the 1st at 1.33 A.M., and on the 31st at 1.42 A.M. On the 13th, at 6 A.M., she will be in conjunction with the moon, the planet being rather more than a degree south, and on the morning of the 26th she will be at her extreme westerly elongation. During the month Venus will be on the meridian, or due south, about 9 A.M., when she can be seen in strong sunlight by the naked eye, if the observer knows her exact position.—Mars is gradually increasing in lustre, and, with Venus, adds considerably to the brilliancy of the eastern morning sky. He can be easily recognised below Castor and Pollux by his red and steady light. Mars rises shortly before midnight throughout the month, but he is too near the horizon at that hour to be clearly visible. He will, however, be conspicuous till shortly before sunrise. On the 31st he rises at 11.23 P.M., and will be near the moon on the morning of the 12th.—Jupiter is both an evening and morning star in the constellation Pisces. He rises on the 1st at 7.41 P.M., on the 15th at 6.44 P.M., and on the 31st at 5.38 P.M., and is on the meridian on the 15th, about an hour after midnight. He is therefore in the east and south-east during the evening, and in the south and south-west in the morning hours.—Saturn is an early evening planet in the south-west. His altitude above the horizon is not great, but he may be still recognised among the stars in Scorpio. He sets on the 1st at 9.32 P.M., and on the 31st at 7.40 P.M.—Uranus can be observed as a telescopic object at and after midnight.

In 1868, Jupiter will be the evening star of September and following months, and, excepting the moon, he will be the most conspicuous object after sunset. He will remain tolerably stationary among the stars in Pisces throughout the remainder of the year. Jupiter is the largest planet of the solar system, and, omitting the minor planets, the fifth in order from the sun. His diameter is about 85,000 miles, and his bulk is nearly 1250 times that of the earth. He is accompanied in his orbit by four moons visible with slight optical aid, and his system bears a complete analogy to that of which he is a member, obeying the same laws, and exhibiting in the most attractive manner the prevalence of the law of

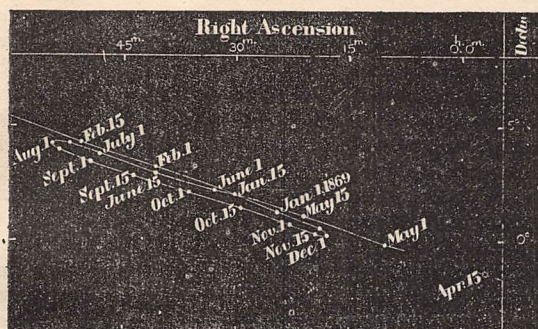

gravitation as the guiding principle of the motion of the satellites around their primary. The time occupied by a complete revolution of Jupiter round the sun is nearly twelve years. His average distance from the sun is 476 millions of miles. Some idea of the extent of this interval of celestial space may be gathered from the fact that a cannon-ball going at the rate of 500 miles an hour, would take more than ninety years to perform its journey between Jupiter and the earth; or a railway steam-engine travelling fifty miles an hour, would require nine centuries to pass over a like distance.

Jupiter revolves on his axis in about nine hours and fifty-five minutes; a Jovian day is therefore less than ten of our hours. His mass, or weight, is 300 times greater than that of the earth, but as his bulk, or volume, is nearly 1250 times greater, it follows that his density can only be one-quarter that of the earth. He is passing through space at the rate of 28,743 miles an hour, and is also performing his equatorial revolution on his own axis at the rate of 27,726 miles an hour. As seen from the earth, Jupiter does not present any sensible phase in ordinary telescopes, owing to his great distance from the sun; but when observed through a powerful telescope the right or left edge of his disk shows occasionally considerable signs of want of illumination.

When viewed with the naked eye, Jupiter shares with Venus that universal attention which is always given to the evening and morning stars; but sometimes Jupiter shines with even greater splendour than Venus, especially when he is due south at midnight in the winter months. At these times, he passes the meridian at an altitude equal to that of the sun in summer, while the light of Venus is frequently partially eclipsed by the twilight, or by the hazy nature of the atmosphere near the horizon. But when Venus is at her greatest brilliancy, the greater intensity of her reflected light makes her invariably the brighter planet of the two, although her diameter is much smaller than that of Jupiter. It is, however, as a telescopic object that Jupiter has become so popular and valuable to the astronomer, for by the application to the eye of a very ordinary telescope, the four attendant satellites or moons, and the distinctive lineaments of light and shade on his surface, become distinctly visible. The motions of the satellites around Jupiter are very soon perceptible, as they are continually changing their positions with respect to the body of the planet. Sometimes they are seen to disappear into the shadow of Jupiter, and thus become totally eclipsed, similar to our own moon; at other times they are observed to pass behind the planet, and then reappear on the opposite side; and again at other times they may be noticed on the disk of the planet. This last appearance is a very interesting phenomenon, as not only the image of the satellite is projected on the disk, but its shadow also is generally seen at the same time as a small round black spot. On some occasions, Jupiter is seen apparently without satellites, but this occurrence is very rare. The last phenomenon of this kind took place on August 21st, 1867, when, notwithstanding the general unfavourable state of the weather, some very interesting observations were made. The most curious was the appearance of the fourth satellite on the disk of Jupiter as a dark object, nearly as black as its shadow. From this observation, it has been inferred that the reflective power of this satellite, which is the most distant from Jupiter, must be greatly inferior to the other three, and that it is also of less intrinsic brightness than the body of the planet. The telescope also reveals to us that the surface

of Jupiter is partially covered with brownish-grey streaks parallel to the equator. Two of these are very conspicuous, one north, the other south of the equator. They extend completely around the ball of the planet, for no great deviation in their form can be observed on opposite sides. These streaks, or belts, resemble in some measure the lines of stratus cloud often seen on calm evenings near the horizon about the time of sunset. Between the two principal belts, a more brilliant ground marks the equatorial region of the planet. Towards the poles, a continuation of parallel belts of different intensities can be observed. The illumination of the disk near the poles is evidently more feeble than near the equator. Occasionally dark round spots have been seen on the principal belts, which have afforded a good means for the determination of the time of rotation of the planet. Some excellent drawings of Jupiter have been made by Mr. De La Rue, Sir John Herschel, M. Mädler, and others.

The following diagram exhibits the apparent path of Jupiter from April 15th, 1868, to the end of February, 1869:—

The phases of the moon take place as follows:— Full moon on the morning of the 2nd, at 3.57 A.M.; last quarter on the 9th, at 10.4 P.M.; new moon on the 16th, at 1.20 P.M.; and first quarter on the 23rd, at 3.22 P.M. She will be nearest to the earth on the morning of September 15th, and at her greatest distance on the 27th, at 1 P.M. On the 4th she will be near Jupiter, and on the 8th, at midnight, near Aldebaran. The distance between the moon and star will diminish gradually till 4.58 A.M. on the 9th, when Aldebaran will disappear behind the moon. At 5.46 A.M. the star will reappear on the opposite side of the moon. To view this phenomenon, it will be necessary to have the assistance of a telescope, as the daylight will be too far advanced to allow the star to be seen with the naked eye. One with a low power will be quite sufficient. The moon will be near Mars on the 12th, Venus on the 13th, Mercury on the 17th, and Saturn on the 21st.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER III.—VALENCIA.

VALENCIA, beautiful Valencia! whether we speak of the province or its capital, both bearing the same name, what can equal the delights of a residence in this favoured land? The province being encircled with mountains, the cold blasts from the north and east do not visit it; snow and frost, fogs and vapours, are alike unknown. Valencia has derived great part of her beauty and fertility from the abundant supply of water. Rice crops thrive here to perfection. Oranges, citrons,

lemons, grapes, the very finest figs, almonds, dates, and other semi-tropical fruits, such as the carob-tree, with its locust beans, grow in profusion.

The Valencians pleased me more than any of the Spanish people, as far as their outward attributes were concerned; they are gay, good-looking, amusing, and picturesque in their dress and appearance. But the picture has its dark side; they are very revengeful, nay, even treacherous, not unlike in some things what the French call “une caractère tigre singe.” I only saw the bright side. The high-born Valencians, to many of whom we had introductions, were as polished, intellectual, and agreeable as any foreigners I ever associated with. There is much of orientalism in the manner of life, in the dress, and even in the appearance of the Valencians. The peasant costume, especially that of the men, is most picturesque: they wear sandals, and their legs are generally bare, or sometimes they have what is called a Valencian stocking, viz., stockings without feet; full loose white linen drawers, a velvet jacket, a brilliant coloured silken sash wound round their waist, and in some instances, what they call a manta, which may be described as something like a shepherd's plaid; on their heads, instead of a cap of any kind, they wear a silk handkerchief, put on in the form of a close-fitting turban. They are very dark-complexioned, almost African in hue; but not so the women, they are only richly bronzed; their hair is beautiful, and they wear it entirely uncovered, rolled round in massy coils low down on their graceful heads, with only a long silver or gold pin run through it: nothing can be more classical than this head-dress.

We arrived at Valencia on the 2nd of May, and intended remaining there three weeks. It may be too warm and sultry in the height of summer, but at the season I am speaking of, the mode of living in the courts covered with awnings in the interior of the houses protects one from the heat of the sun; and these courts, with sparkling fountains, and all adorned with flowers, form the most delightful sitting-rooms imaginable. The mornings and evenings are cool, from the prevalence of the sea breezes, and the nights are delicious. The houses are decidedly eastern in appearance; the basement is generally three or four feet lower than the street. The balconies that adorn nearly every edifice are shaded from the sun by strips of gay matting, which is made in Spain with great taste and of different designs; the most beautiful convolvuluses twine all round the pillars and balustrades. The public walks are unrivalled, and no wonder, as Spaniards spend all their evening, and often many of the night hours on these alamedas.

Mulberry and orange groves seem to encircle the town with their luxuriant foliage. The former are a great source of profit to the Valencian farmer. The manufacture of silk is largely carried on here, and nothing can be more picturesque than the sight of the peasants seated under their vines and fig-trees, and winding out the soft golden tissue from the cocoons. To do this requires practice and a very light finger, to prevent the delicate thread from breaking. The black silk used for the mantillas, is said to be superior in Valencia to any other made in Spain. We could make no comparisons, but we saw that it was very beautiful, soft, lustrous, and rich.

Time was when no carriage of any kind could be procured in Valencia but the native tartana, a long narrow covered cart, without springs; I speak feelingly on the subject, as in other Spanish towns we sometimes were obliged to make use of one. Now more civilised

vehicles are being introduced, and in a very fair specimen of a carriage we drove about the picturesque old narrow streets, and visited the different objects of curiosity, for descriptions of which the reader must refer to Ford's "Spain," and other handbooks. I paid many visits to the old convent Del Carmen, where the spoils of many monasteries are collected.

It is a singular feature of Spanish churches that there are no chairs in them. The peasant, man or woman, would kneel down at once on the bare stone, without any preparation; the smart young Valencian would carefully spread his handkerchief and kneel on that, resting his hands and his head on his stick held up before him, while the prettily dressed *senoras* were always preceded by a servant carrying a square of Persian carpet, to put down wherever their mistresses might desire, that no dust or dirt might sully their dainty attire. The Calle de Caballeros, or street of Cavaliers, is the aristocratic quarter of Valencia: the houses are very handsome, and have an air of solid nobility something resembling the old Italian palaces; fine large portals open into a hall with arched colonnades, and staircases with richly carved banisters; and windows, either Gothic or else with a slender shaft dividing the opening, give altogether an ornamental picturesque aspect to these dwellings. Nothing can be lighter or more elegant than the effect of the long lines of open arcades under the roofs.

There are many traces of the Moors in Valencia. Certainly few conquerors of a foreign country ever left so many traces of beneficial influence behind them as the Moors did in Spain. Everywhere one meets traces of their sagacity, their courage, their high poetical feeling, and their refined taste.

In the very heart of the city there is a plaza, called El Mercado, where in olden times the tournaments were held. It is a fine open space. One large public building very greatly excited our admiration, the "Lonja de Seda," or Silk Hall; it is a most beautiful Gothic building of great antiquity. The saloon is splendid. It is a sort of exchange or hall where the great merchants meet and transact business. The Valencians may well be proud of their beautiful Lonja.

There are charming walks about Valencia, one especially I was very fond of, leading across the bridge called El Real. The royal residence of the viceroys, El Real, was on the other side of the river, or bed of the river, for the endless canals for irrigation have drained away the water for half the year at least. The river at this spot divides the Glorieta from the beautiful avenues of the alameda, whose charming shady walks continue down to the very steps that lead to the shore. In the bathing season this is the great resort of all the Valencians; it is known by the name of El Grao, or steps down to the sea. The Temporado de los Banos (the bathing season) is a time of great gaiety; the road leading to the shore is absolutely so crowded with vehicles of different sorts, that it is said to be a difficult matter to get along it when the bathing mania is at its height. The baths are thatched with rice straw to keep out the intense heat of the sun.

We made also pleasant excursions; one to the Alpuxera lake, and the nice grounds in the neighbourhood of Alcinas. In the course of one of our excursions we fell in with a very singular character, just at the foot of a wild and solitary pass, when we were pausing to consider our further way, having considerably deviated from it to see the pass we had just descended. He certainly had all the air of one of those rovers that we had so often heard described as making their haunt in the

mountains, and pillaging the traveller whenever an opportunity offered. He was mounted on a young active mule, and he wore the Andalusian hat and jacket, and pantaloons bordered by silver lace; he had a cartridge-belt of crimson velvet slung over one shoulder and passing under the other arm, two carbines slung behind his saddle, and a long Spanish knife in the pocket of his vest in a sheath ornamented with silver.

Gandia is a striking place, with curious old remains in and about it. At Denia, in the immediate neighbourhood, are grown raisins for the English market. They are not equal to the real Valencian raisins, but there is a great demand for them. The Huerta, or garden of Gandia, as it is called, is famed for the luxuriance of its crops of all kinds. The celebrated lake that we were anxious to visit is about ten miles from Gandia; the lake is said to be about thirty miles in circumference.

The number of birds that breed on the banks of this lake is astonishing. Between seventy and eighty different varieties of wild fowl and other kinds of birds resort to its shores. There is nearly as great a variety of fishes. There are two days during which the shooting is thrown open to the public, and according to the accounts we received the scene must be a most singular one; many hundred sportsmen assemble, and either go on the lake, or ramble along its shores, or fish in the waters. At one time this lake was royal property, and it was valued at £300,000. The time to see it to the best advantage is in the winter, but even as we saw it, it was a singular sight. The country all around is charming from its wonderful fruitfulness. We only returned to Valencia after a pleasant little tour, just to make final arrangements. We were to go from Valencia to Alicante, then to Elche and Murcia, on to Almeria, and so finally get to the district of the Alpajurros, which we greatly wished to explore. Our last two days were very busy ones: we had kind friends to take leave of, some last sights to see, etc. Amongst others we went to see where the beautiful Valencian fans are made, a trade that in its great perfection is essentially Spanish. Calominaio, in the Calle de Zaragoza, is, by all the most fastidious Spanish ladies, reckoned the greatest master of the art, and his fans are sent to many distant parts of the world. A real old fan is very difficult to procure at all. Our last day was spent in the beautiful botanical gardens, where the magnificent growth of tropical trees in the open air speaks plainly of the beauty of the climate. We remained there late on into the evening, and turned away with great regret, feeling it was our last among the beautiful sights of Valencia.

We had a charming last look the following day at the beauty of Valencia from the summit of the castle tower at Xativa, a charming town enjoying a delicious climate, and surrounded by a perfect paradise of fruits and flowers. We spent the day at Xativa. The alameda is delightful and very oriental; fountains, bright and sparkling, abound. The view from the terraces of Monte Calvario with their beautiful cypresses is charming, the castle is fine and of vast size.

Our onward journey led us through scenery varying in character, at times stone pines and cypresses gave an Italian character to the scene, and then again the road wound round beautiful headlands, on through extensive orchards of different kinds of fruit-trees, or else the vines covered every part of the country. The profusion of almond-trees everywhere is very remarkable. Apropos of these trees I must notice the exceeding love of the Spanish women for sweetmeats of all kinds, but especially of a kind of cake made of honey, almonds, and

sugar; it is called *mazapanes*, and in French *nourgat*, and I must admit its excellence, though, from the ingredients that compose it, it is very rich; the quantity of it consumed by the Spanish women is hardly credible, had I not been told it on very good authority. This also is an eastern taste, the women in the harems being all celebrated, not only for their consumption of these dainties, but also for their skill in preparing them. Many interesting villages we passed before reaching Alicante. Alcoy is curiously situated in a deep hollow amidst hills, the houses are built on their precipitous sides, and from a little distance look as if they must slide off into the ravine. Tibi is also very picturesque; we paused there awhile to see the old Moorish castle, which seems to be suspended over the village as its protector. The houses are all crowded round the old fortified building; rocks and mountains are everywhere around you; the rocks in many places have a rich red colouring, which has a very fine effect in the scenery, and gives a mellow, softened tone to what might otherwise be too glaring. The fine castle Xijona delighted us all very much, a most interesting spot for an artist, as the views both of the castle itself and of the surrounding scenery from the hill on which the castle stands are all beautiful in their way. Alicante, where we only intended remaining long enough to arrange for our onward progress, was the least interesting Spanish town we had come to. It is very healthy, and many English engaged in trade reside there.

We preferred driving from Valencia to Alicante to making the journey by steam, a voyage of from ten to twelve hours. We hoped thus to see much more of the people and the country. Elche itself is worth any one's while to go considerably out of their way to see, it has so completely the appearance of an oriental town; the houses are flat roofed, the domes are of glazed tiles in imitation of brass and copper, that glisten against the deep blue sky, and seem to increase the sultry look of the place; and the town is literally surrounded by immense groves of the date-bearing palm-trees. We felt as if suddenly transported to the east; to me it seemed as if I had been taken back without my knowledge to Egypt where I had been two years before. The journey from Elche to Murcia is most interesting. The road winds along the most fertile country, which has been compared to the Delta of the Nile; it is perfectly level, and is a continued garden for many miles, covered with groves of orange, citrons, and pomegranates, with palm and date-trees. We passed the night at Orihuela, situated in most lovely and romantic country. Indeed the whole valley of the Seguras is reckoned one of the most beautiful parts of Spain. Great rocky mountains enclose the plain, picturesque in their outlines, and sublime from their very nakedness and sterility. Murcia, which we reached the following day, pleased us much. Not having expected anything, our satisfaction was all the greater. It is situated on the banks of a little river, in the midst of delightful gardens and orchards filled with the finest southern fruits, with here and there lofty palm-trees to give an oriental character to the scenery.

The people of Murcia are thorough Africans in feature and colour, and they very much resemble them in many qualifications; they are constantly emigrating to Algeria; they partake the arid dried-up nature of a great part of the soil, and are fierce and fiery in temperament. Their superstition is really incredible: there is no legend, however wild and impossible, if it is of supernatural agency, that they will not greedily devour, and their terror at any bad omen, when about

to undertake any important business, is most deplorable to witness in these civilised days. They are also very revengeful, like the Corsicans. They have a proverb about themselves to the effect that the earth is good, and the heaven is good, and all between them bad, "El cielo y suelo es bueno—el entre suelo malo." This is akin to Bishop Heber's contrast—"where every prospect pleases, and only man is vile."

Murcia is rich in metals of different kinds, and at the time of my visit the Murcians were smitten with a mining mania. It is said that the identical shafts sunk by the Carthaginians have been opened again.

From Murcia we intended to ride to Lorca, as we liked that mode of travelling far better than being shut up in a carriage; and whether we had horses or mules we had no cause for complaint, we were always very fortunate both as to the animals we rode and the guides who had the care of them. We halted both at Potana and Librilla; these places are the head-quarters of the Murcian gipsies. Their costume is most striking, so gay and ornamented that it is more like a brilliant fancy dress. Their complexions are of most African darkness, and their whole appearance remarkable. We were at Potana on a festive day, a day of rejoicing amongst this strange community. And we therefore saw them in all their best dresses, and, moreover, we were interested by seeing some of their national dances. They used a curious sort of guitar, drawing most melodious sounds from it, accompanied at times by a low murmuring recitative, and at times bells were brought in of most silvery sound. All the innkeepers in the district belong to this tribe; they trade considerably in the snow of the Sierra di Espana, which begins near Potana; they have monopolised it almost entirely, and make a very profitable thing of it, as the demand for snow in the towns during the tremendous heats of summer is very great. We had taken great pains at Murcia to engage good mules. Our cavalcade presented a very imposing appearance. It was now the first week in June, we were all in excellent spirits, feeling that we had a prospect of most unusual enjoyment before us. We were to ride first to Gandise, thence to Almeria, where we should be very near the district we wished to explore—the Alpajurros, the last part of their beautiful country that had been left to the Moors, and where numerous traces of them still linger. The grand old Castle of Xiguena, and the magnificent stone pines in the neighbourhood, attracted our attention and admiration.

Soon after making the little detour to see the castle, we left Murcia for the mountainous districts of Granada and Ronda. The climate here is very different from the more southern plains near the sea-shore; the fine mountain air renders this part of the country healthy and bracing in no common degree; and in summer this cooler district is much resorted to. Here hill forts abound on dizzy heights like the nest of the eagle, and they must have added greatly to the strength of the country formerly. The inhabitants of these mountain regions partake greatly of the nature of their country, their occupations varying from the pursuits of the chase to those of the smuggler. The smuggler enjoys in Spain anything but a bad reputation, for the mass of the people sympathise with him and his adventures. In England many do with the poacher. Of this I have frequent instances, during the time we spent in these wild mountainous districts. I have seen half the village population surround some of them, as in their brilliant dress (which always calls forth the admiration of these people) they burst forth in their well-known song, "Yo

que soy, contrabandista, yo ho!"* and express their delight by the loudest acclamations.

Almeria, once one of the most flourishing and richest towns on the coast, is now in a complete state of decay. The Moorish castle was repaired and strengthened in the reign of Charles v, and a bell of large size was placed there to give timely notice of the approach of pirates. There is a curious cape on this coast, called El Cabo de Gata, with a white mark called Vela blanca, on the rock, forming a well-known landmark with sailors.

We were very well pleased with the arrangements for our prolonged ride. One of the mountain horses in our train carried stores, including tea, sugar, and such eatables as we were not likely to meet in out-of-the-way inns. Shall I ever forget the delight of travelling far on into the beautiful nights, having rested during the glare and the heat of the noonday?

LIFE IN JAPAN.

VII.

FAC-SIMILE FROM A JAPANESE SKETCH.

FAMILY RELATIONS.

THE Japanese are affectionate towards each other in their family relations. Amongst the lower classes fathers may often be seen caressing their children. I have before me now a native sketch of a family, father, mother, and children, walking along the shores of one of the numerous inlets of the sea which intersect these islands in all directions. The father bears a single sword, and therefore belongs to a class above that of a labourer or tradesman. By the sumptuary laws of Japan, doctors, for instance, are permitted to carry one sword, while the retainers of princes, and all who are accounted gentlemen, wear two. This father carries on his back his son, a stout child, who is stretching out his hand to his mother. The boy's head is carefully shaved with the exception of a small

tuft on each side above the ear, which, as he grows older, will be permitted to lengthen, and finally will be drawn up and stiffened into a coiffure similar to that of his paternal parent. The mother has the aid of a stick, necessitated by her using tall pattens. Her large straw hat hangs from her shoulders. She also carries a parcel strapped by a thong round her waist. We may conclude that they are travellers who have had wet ground to pass over, from the careful way in which their feet are protected, the husband wearing, instead of his ordinary sandals, others that are adapted for bad roads. In the distance rises Fusi-yama. Possibly, therefore, these travellers are proceeding to Yeddo, the capital city of Japan. The sea is dotted with rowing and sailing boats, most of which are employed in fishing operations, so necessary where the population depends mainly on the finny tribe for their maintenance.

In the summer-time, almost naked copper-coloured fathers may often be seen carrying in their arms entirely naked copper-coloured children, who seem perfectly contented with their nurses.

Sometimes drink is the cause of much unhappiness in Japanese homes, as in those nearer to us, but as a rule domestic matters roll on smoothly enough, thanks to the forbearance of the wives, for the habits of the husbands are not always conducive to the happiness of married life.

Once a year a feast is celebrated to commemorate the births of children. Houses where there has been an addition to the family are decorated with flags and streamers of coloured cotton. Over the threshold small figures, dressed in gay colours, are suspended from long poles; two denote the birth of a son, one that of a daughter.

Amongst the higher classes the heads of families often show their devotion to their relatives by the extremest self-sacrifice, killing themselves by the *Hari-kari*, or happy despatch, when through any circumstance the law has been violated, in order that the consequences of the act may not fall upon their relatives, who would otherwise be liable to forfeiture of property, or perhaps death, if the untoward act were not at once acknowledged and atoned for by this shocking kind of suicide. Amongst the high officials it is a point of honour to perform this act if any failure occurs in their department which would render them liable to the displeasure of the supreme power, and by so doing all bad consequences are averted from their children, and their sons are sometimes placed in high offices as a reward for the fathers' self-abnegation.

As another instance of self-devotion, the servant of a much-loved lord will sometimes cause himself to be placed in a small stone enclosure, and covered with earth, a pipe conveying sufficient air to the mouth to support respiration. The devoted servant prays incessantly for his master, until death from inanition puts an end to his self-inflicted sufferings.

Parents are said by the old Dutch writers frequently to give up their property to their children on the latter attaining their majority, and from the tender care of the latter for their father and mother, they have seldom cause to regret this abdication of power and property.

Toy-shops abound in Japan, and this fact is regarded as a proof of the thoughtfulness of the seniors for the young people. By-the-bye we may mention here the admirable way in which the squeaking Dutch dolls are imitated by Japanese toy-makers with a few bits of bamboo and paper. These babies, which have the

* "Here am I! a contrabandista."

unmistakably Dutch features, squeak on pressure quite as successfully as those which amuse our own children.

Female domestics wait on their mistresses, attend them to the baths, hold umbrellas over their heads to protect them from the glare of the sun, or from rain or snow, cook food, and sweep, and do the small amount of housework requisite in Japanese houses.

The system of noblemen assembling around them all their most distant retainers, makes the ramifications of Japanese families extend as widely as did those of the Highland clans in the last century, and these retainers are as devoted to the interests of the head of the family, and as willing to sacrifice life and all that makes it valuable for their prince, as the dunnie wassels were to fight and die for their chieftains.

The kago is a lighter, but equally inconvenient vehicle, carried by two men. Its framework is like two great wicker Vs, joined together. A wadded quilt is folded upon it, and on this a mother and her babe may be seen passing up the hillsides, the former doubled up as if she had been amputated at the knees.

The great princes spend half the year at Yeddo, the governmental city, and half the year on their territories. Their wives and families are supposed to be left at Yeddo as hostages for their good conduct. This frequent change of residence causes the ladies to travel about more than is usually the case in Eastern countries. A ford has often to be crossed, and then they quit their norimons and sit on a light kind of platform, which is carried across on men's shoulders. Women of

THE HALT OF THE NORIMON.—From a Japanese Sketch.

TRAVELLING.

The norimon, a kind of palanquin in which travellers both male and female are carried, is constructed on a principle only adapted for a people whose ideas of repose and comfort are utterly at variance with our own.

Our sisters in Japan, when fatigued by moving about, sit down on their heels in an attitude suggestive of cramps and stiffness, and appear to be as well rested by remaining in that position as we are by sitting on a chair or reclining on a sofa, and so they submit to be packed for hours in a sort of lacquered cage, which is suspended from a strong pole borne on men's shoulders. Two bearers go in front, and two behind. The norimon only clears the ground by about one foot. In cold weather the bearers are dressed in a long cotton tunic, which they tuck up under their waistband when they are carrying an important personage, in order that the limbs may be moved freely. The badge of their master is stamped or embroidered on the shoulders and back, but in summer even this garment is dispensed with. They carry the norimon with its live freight at the rate of about three miles an hour; the movement is very unpleasant, and tiring to those unaccustomed to this kind of locomotion. There is an opening at the side, but it is almost impossible to look out of it without straining one's neck, so that one is conveyed across the country very much like a bale of goods, and can only catch an occasional glimpse of the passing scenery.

the lower classes, who are unable to pay for the extra accommodation, frequently sit on the stalwart porters' shoulders. These men are responsible for the lives of their passengers, and as death is the general penalty for grave misdemeanours, in cases of accident they frequently prefer meeting death with their burdens rather than face it at the hands of justice.

Accompanying this is a sketch, by a native artist, of coolies resting for a while upon their heels (the uncomfortable position previously referred to) by the roadside. They have deposited their burden on the ground, and its peculiar shape, and the heavy pole from which it is suspended, when carried, are well drawn. The stolid faces of the bearers' countenances show clearly that they belong to the inferior grades of society. A far more intellectual expression is given when it is wished to represent persons who belong to the educated classes.

Behind them is a high bank, on which some fir-trees, resembling the Scotch fir, are growing, and a row of thatched cottages is also seen, that gives an excellent idea of the buildings in which the Japanese peasantry live. They are mean erections, but there is an air of neatness about them which redeems their appearance from anything squalid or poverty-stricken.

A large number of bearers are always taken on long journeys, in order to serve as relays.

The rugged paths along the steep mountain sides, and the uneven character of this hilly and volcanic country render a norimon-bearer's life a hard one.

They must ford the numerous shallow streams, toil up the rocky paths, often merely the dry beds of mountain torrents, and carry the norimon and its contents for many a weary mile. Even in the towns the labour is not slight, for high flights of stone stairs are often necessary in the streets, in order to facilitate locomotion. Up and down, up and down these out-of-door staircases the bearers and their burdens must go. It is no unusual thing in some of the southern cities for a temple to be approached by flights of granite steps, numbering a hundred or a hundred and forty, and up these the norimons frequently pass when conveying Japanese ladies to their devotions. Ponies, also, can run up these staircases almost as safely as cats. They are spirited and somewhat vicious animals, tolerably easy to ride but always snapping and biting at each other. It is a Japanese custom to shoe them with straw shoes, which of course are rapidly worn out. They are then left on the roadside, and a fresh pair tied on. A supply is attached to the saddle.

Japanese women are never seen on horseback.

MY FIRST CURACY.

CHAPTER IX.—LECTURES, READINGS, NIGHT SCHOOLS.

My anecdote about the vicar's wife has caused me somewhat to digress from the immediate subject we were engaged upon, namely, the utility of lectures.

I cannot help thinking, one great reason why our series were more successful than many others, arose from the fact that they were not dry nor very learned. Another reason was, that an hour and a quarter was the well-kept limit allowed to each lecture. A kind friend, quite unintentionally, placed the whole series in jeopardy by keeping us two entire hours in the moon, clothing his ideas in a mist of the most scientific language, and far-fetched words. The room was densely crowded at the commencement of the lecture, but gradually thinned as it proceeded. I am sure that not more than four persons of the whole audience could understand five consecutive sentences. The preparing of the lecture must have involved much labour, and its materials showed great powers of research and a very high order of intellect. But he might as well have delivered a Greek oration, for all the benefit or amusement our people obtained. I did not again ask my learned friend to assist us.

These kind of unsuitable lectures do more harm than good. You cannot expect uneducated persons to sit quiet, and to be interested in a subject which in itself may be highly instructive, but which, from the peculiar organization of the mind of the lecturer, or from the absolute want of common sense, he is unable to present in a popular manner.

After three years' trial of lectures alone, we thought it wise to introduce a little variety; accordingly, the lectures (which were held every fortnight) we alternated with readings of poetry and prose. Now, these readings took remarkably well, partly because we had a different reader every ten or twelve minutes, and partly because there was a continual change of subject from grave to gay, though, of course, great care was exercised lest anything vulgar or coarse might crop up. We found, also, that in these readings we were enabled to obtain far more assistance than we could in our lectures, and thus our own burden was considerably lightened. Under the name of "Penny Readings," these entertainments have lately become

quite "an institution," but our adoption of them was entirely our own experiment.

In summing up the practical results, both lectures and readings, I think they were chiefly these. First, they formed a subject for conversation, both before and after the event itself. Now, the gaining of this simple point alone was worth the trouble taken, for I am sorry to say our village was much given to scandal and gossip. Secondly, they certainly imparted a large amount of instruction and information to the people generally. Thirdly, by frequent reference to particular books in the lending library upon kindred subjects, they very much aided in the circulation of these particular volumes, thereby creating a taste for reading which was, of course, a great object attained. And lastly, I found that they tended to produce a more kindly feeling among the parishioners themselves. The more distant ones were asked by those dwelling nearer the lecture-room to come and spend a social evening, of which the lecture was to be the centre of the night's amusement. In thus drawing the people together, and inculcating a love of hospitality, which from various causes is not very general among the middle class in the country, much good, I believe, arose, and there was produced a kinder feeling.

I do not, for one moment, pretend to say that the lectures or readings succeeded in drawing old drunkards from the public-houses, or in attracting all the idle characters of the village. This would have been simply impossible to bring about by any form of entertainment we could have established, in which plenty of good eating and drinking, especially the latter, did not form the principal attraction. But I subsequently found that the minds of many of the parishioners were enlightened upon numberless subjects, concerning which they had hitherto possessed but little knowledge, and among the young men especially, a desire to hear and to read more about them was certainly created. And when you consider the long winter evenings, the early hour at which, of necessity, the farm labourer must leave off work, the unoccupied time hanging upon his hands, unless some instructive amusement is provided for him by others, the result is in nine cases out of twelve that the evenings are spent unprofitably, and too often foolishly and sinfully. I know that the getting up of these things, and the keeping them going when set on foot, entails a vast amount of extra work, but it must be done—and by the clergy too, for we get very little help and still less sympathy from the laity of our respective parishes in our desire to raise the tone of our rural population. Our efforts are very often frustrated, and our schemes of usefulness brought to nought, because we are not supported as we ought to be by the employers of labour.

With regard to night-schools and adult classes, I had three evenings a-week devoted to them during the winter months, two for all ages, one exclusively for young men. How fearfully these classes were wanted! I never could have believed that such ignorance existed as I found to be the case. I would not disgrace these pages by the unintentionally absurd, and even blasphemous answers given in reply to my various scriptural questions, but I think the reader will easily imagine they were bad, when he remembers that I have told him in a previous chapter, that all the Bible history the children had been taught at school, was contained in the two books of Leviticus and Revelation, not forgetting the earlier part of the first chapter of the Gospel according to St. Matthew. Let one answer showing genuine simplicity in a little girl suffice. A lady of my acquaintance was asking her some questions about a

chapter in the Second Book of Kings, which the class had just been reading, and among the questions asked, was one, "What did the little Hebrew maid do for Naaman's wife?" The unexpected simple answer was, "Please, ma'am, I think she cleaned the knives."

The first thing in our night school we had to set about was, to reform the filthy habits of the boys, to teach them common decency, and to wash their hands and faces, and to comb their hair. They sadly wanted not only Christianising, but also civilising. To promote this end, I called in the assistance of the vicar's wife and the services of the younger of two maiden ladies, who lived in the village, not far from the church; and their united help was most valuable, especially that procured from this single lady. The vicar's wife was delicate and could not always attend; but this lady was always at her post. Wet, cold, and snow, never prevented her attendance, and the knowledge of this fact not only acted as an inducement to the boys to come regularly, knowing that their teacher would be there, but it also acted as a spur to my own exertions.

Oh what walks I sometimes had to these night schools and choir practices! My road, for a mile and a half, was up and down a steep lane, with high banks on each side: it was also so narrow, that frequently I have had to rush up the banks in order to avoid being driven over by drunken carriers returning from the market town. In addition to sometimes finding the lane blocked with snow, at other times finding nearly impassable pools of water in the hollows, I could fill many a page with the curious adventures I met with in this lane, in the dark evenings of both summer and winter; the frights from poachers and gipsies, the laughable incidents too that happened to me—as falling over a donkey, most unexpectedly lying in the middle of the lane, on one of the darkest nights I ever remember to have been out in; the tumbling into ditches, the running against gates, and the like accidents; but I forbear, as I wish to continue my narrative concerning our evening classes.

During the whole of my stay in the parish, this lady was my firmest friend, most uncompromising champion, and resolute fellow-labourer. I believe she would have made any sacrifices for the boys and youths of the parish; indeed, she suffered much inconvenience from them, and even persecution at times. For instance, I have known her to have been pelted, frightened, snowballed, fired at by a pistol, her garden run over, the beds trodden down, the flowers gathered, and the plants destroyed. I have known her shutters repeatedly rattled, her door-bell violently rung very frequently, disgusting valentines and anonymous letters sent to her; and yet, notwithstanding all this cruel ingratitude shown to her by individuals with whom she had taken the greatest possible pains, she did not grow weary in well-doing. She possessed a sharp eye and a quick ear, both necessary qualifications in an efficient teacher, and what is more rarely found among ladies, she had a perfect knowledge of arithmetic. She understood music, though she played but little herself, so that she was of great assistance also in that stumbling-block of so many parishes, a village choir.

We were accustomed to keep the boys two hours nightly, the last half hour being invariably devoted to scriptural instruction, ending on alternate evenings with prayer and praise. The attendance of boys at first starting the evening school was very numerous, so much so, that I was obliged to limit the admissions; but, in course of time, as the novelty wore off and the boys saw that we intended to make them work, there was no further necessity to do so.

Now, the advantages of the night school were twofold. Firstly, to the boys themselves, for, by the education we imparted to them in the course of two or three winters, they were enabled to obtain various situations in the neighbouring towns, and even in the metropolis itself. They thus escaped the painful privations during their manhood, and the extreme amount of penury which so many of their parents endured in that particular agricultural district. The second advantage arising from our evening classes, chiefly concerned our neighbours and ourselves. Many of the boys became gradually less noisy in their conduct and at their various games, though some of our enemies, for all persons who try to better existing evils will have enemies, called them "stuck up" and "self-conceited." They certainly came more regularly to church, and behaved much more reverently when there. They were more respectful and gentle in manner, and some of them learnt that difficult but all-important lesson—self-respect. I do not mean to allege that this change was wrought in a month, or in the course of a single year's teaching; but it was as the heaven working in the meal. I will not pretend either to say that our instructions produced the same good fruit in all; that would not be true—far from it. There were many disappointments with particular individuals, who showed by their after conduct, that our influence had only been temporary and not lasting.

After I had become really acquainted with the boys and the young men of the parish, I made it a point, which I still retain, of corresponding with each youth as he left the parish. I did this about every six weeks or two months. This plan, I allow, adds much to one's labour, especially as I have removed to a more extensive and difficult sphere of duty; but I am frequently convinced, by practical knowledge, that very much good results from this practice; and though my correspondence grows apace, yet, under God's blessing, I mean to continue to write to them all as often as possible. The course I pursue is not to be "sermonizing" in my letters; and, consequently, the replies I receive are open and confidential. Numberless are the secrets entrusted to me, and advice is asked on a variety of subjects.

With the class of young men I stood in even closer relationship. I wished them to look upon me as an elder brother. In this I succeeded with some; and many is the tale of sorrow, of deceit, and of sin, I have had poured into my ear, not as to a priestly confessor, but as to a friend ready to sympathise both with advice and with my purse, as largely as it lay in my power.

Poetry.

WRECKED.

O soul, storm-driven on the shoreless sea,
Which thought of man ne'er fathoms, nor can bound,
No helper seeing through the darkness round,
But borne alone towards dread immensity,—
Is this proud reason's glorious destiny?
So drifts the wreck on ocean's great profound,
While winds pursue, and restless waters sound,
The noblest form reduced their toy to be:
No sovereign hand controls the ready helm,
No cheerful voices rise above the wave.
Not thus forsaken, though the billows whelm,
Is he whom Christ hath walked the seas to save:
Above the stormiest day the clouds shall break,
And the worn spirit in His presence wake.

Varieties.

"THE ABANDONED."—Our coloured illustration this month is taken from the well-known picture of the late Clarkson Stanfield, R.A., painted for Thomas Baring, Esq., and, as one of the most characteristic of his works, selected by himself, with three other paintings, for the first Paris Exhibition. Mr. Stanfield, whose loss the artistic world had recently to deplore, commenced life as a sailor, and thus acquired that familiarity with the sea and with all nautical matters, which distinguishes his productions. In 1827 he exhibited at the British Institution his first large picture, "Wreckers off Fort Ronge;" and in the same year at the Royal Academy, "A Calm;" and from that time he became a regular contributor of pictures ranking among the most attractive in the public exhibitions. His visits to the continent were frequent, and his constant practice was to work up in the studio pictures of great elaboration from the well-stored portfolios of sketches laid in during foreign travel. The subjects of his canvases were gleaned from Italy, France, and Holland, the silent streets of Venice, the lovely spots which stud the Adriatic and the Bay of Naples; other romantic points amid the Italian mountains and lakes, amid the Pyrenees, or the rivers and coasts of France; or again, picturesque scenes in the grey Scheldt, the Texel, and the Zuyder Zee, and Ireland.

LETTER-WRITING AND EDUCATION.—The total number of letters delivered in England and Wales in 1866 was 623,400,000, as compared with 597,277,616 in the preceding year, or an increase of 4.38 per cent., or 30 to each person. In Scotland they numbered in 1866, 70,100,000, or about 22 to each person, and having an increase of 4.35 per cent. In Ireland they numbered in 1866, 56,500,000, or 10 to each person—the total for the United Kingdom being in 1866, 750,000,000, as compared with 720,467,307 in 1865.

LONDON CEMETERIES.—Twenty-one cemeteries within the metropolitan district supply 577 acres appropriated to the burial of the dead. There have been already about half a million interments in these cemeteries, and at least 40,000 burials are added to them every year. Some of the cemeteries are getting much fuller than others. In the 33 acres provided by the City of London and Tower Hamlets Cemetery Company, 113,173 burials had taken place at the close of the year 1865; the interments there are at the rate of about 10,000 a year—one-seventh of the whole number of the deaths in the metropolis in a year. In the Abney Park Cemetery of 33 acres there had been 38,639 burials at the end of 1866; and in the 27 acres of the St. Marylebone Cemetery, at East End, Finchley, only opened in 1855, there had been, in the middle of the present year, 28,092 interments. In another cemetery at Finchley, belonging to St. Mary, Islington, burials are proceeding at the rate of 100 per acre every year. The drainage of the metropolitan cemeteries is generally into the public sewer, but not always. There are instances of drainage into an open stream, a brook, the Wandle, the Brent, the Thames. In St. Marylebone Cemetery, Finchley, drainpipes are laid at the bottom of every grave, discharging into a ditch which runs into a small stream; but little or no water passes out of the cemetery, in consequence of nearly every grave having planted on it a tree or shrub. Graves re-opened show roots of trees more than sixteen feet deep. Willow and poplar trees planted on graves have this year made from four to six feet of wood.

SOCIAL SCIENCE ASSOCIATION.—The following are the special questions which have been agreed to for discussion at the Congress at Birmingham, to be held on the 30th of September next:—I.—Jurisprudence Department.—Section A, International Law.—1. Ought private property at sea to be exempt from capture during war? 2. Under what circumstances ought change of nationality to be authorised? Section B, Municipal Law.—1. Is it desirable to re-organise our courts, superior and local, and, if so, on what system? 2. What amendments are required in the existing law of bankruptcy? 3. Is it desirable to amend the present law, which gives the personal property and earnings of a wife to her husband? Section C, Repression of Crime.—1. What are the best means for the suppression of vagrancy? 2. Ought the principles of the reformatory system, including voluntary management, to be extended to adults? 3. What are the principal causes of crime, considered from a social point of view? II.—Education Department.—1. Is it expedient to make primary education compulsory; and, if so, on what conditions? 2. In what form and by what means can instruction in science and art be provided so as to promote the improvement of our manufac-

tures? 3. What measures are required for the further improvement of the Universities of Oxford and Cambridge? III.—Health Department.—1. Can the public hospitals and dispensaries of this country be so administered with regard to the system of giving advice gratis as to conduce more to the welfare of the community? 2. What ought to be the functions and authority of medical officers of health? 3. What is the relation of the water supply in large towns to the health of the inhabitants? IV.—Economy and Trade Department.—1. Is it desirable to have an international coinage, and, if so, in what form? 2. In what manner can arbitration and conciliation be best applied in the settlement of disputes between employers and employed? 3. To what classes, and on what conditions, should out-door relief be administered? 4. What are the social results of the employment of girls and women in manufactories and workshops?

GREAT GLACIER OF NEW ZEALAND.—The "Westland Observer" has an account of a visit paid recently by the chief officers of the Geological Department to the great glacier on the west side of Mount Cook. The foot of the glacier, which is but thirteen miles from the sea, is 1900 feet wide. Neither the glacier nor the immense field of snow which feeds it is visible from the river until within a quarter of a mile of it, when the stupendous mass of snow and ice at once breaks upon the view. Below the glacier a recent moraine extends for several hundred yards, consisting of *débris* of the rock, twenty feet deep, underlain by ice and snow, through which considerable streams of water run, which are rendered visible in round holes, caused by the giving way of the ice and by cracks in the surface. On the southern side there has recently been a great fracture of the ice and breach of the rock, which had fallen in immense masses. The party ascended on the northern side, where the snow or ice formed rounded hills, undisturbed by any cracks or fissures. The glacial matter is porous, and presents tolerable footing; it is of a grey colour, full of small dirt with occasional stones, fallen from the surrounding hills. The great peculiarity of this glacier is not only its immense size, but the fact of its descending to so low a level—640 feet above the sea level—instead of ending, as is usually the case, at an altitude of some 3000 or 4000 feet, close to the limit of perpetual snow, among Alpine vegetation. Here the green bush extends some thousands of feet above the glacier, on the steep sides of the range in which the glacier has cut the deep narrow gorge. Not a single Alpine plant rewarded the research of the party, and the temperature on the glacier was scarcely below that on the flat beneath. With some ceremony the party named it the Victoria Glacier. The height of the peak is found to be 12,362ft.

YOUNG LOBSTERS.—The young lobster, as soon as born, makes a way from its parent, rises to the surface of the water, and leaves the shores for deep water, where it passes the earliest days of its existence in a vagabond state, for a period of from thirty to forty days. During this time it undergoes four different changes of shell, but on the fourth it loses its natatory organs, and is therefore no longer able to swim on the surface of the water, but falls to the bottom, where it has to remain for the future; according, however, to its increase of size, it gains courage to approach the shore, which it had left at its birth. The number of enemies which assail the young embryos in the deep sea is enormous; thousands of all kinds of fish, molluscs, and crustacea are pursuing it continually to destroy it. The very changing of the shells causes great ravages at these periods, as the young lobsters have to undergo a crisis which appears to be a necessary condition to their rapid growth. In fact, every young lobster loses and remakes its crusty shell from eight to ten times the first year, five to seven the second, three to four the third, and from two to three the fourth year. However, after the fifth year, the change is only annual, for the reason that, were the changes more frequent, the shell would not last long enough to protect the ova adhering to the shell of the female during the six months of incubation. The lobster increases rapidly in size until the second year, and goes on increasing more gradually until the fifth, when it begins to reproduce, and from this period the growth is still more gradual.—*Land and Water.*

LITERARY RELIC.—A copy of Eliot's Indian Bible, a work which no living man can read, was sold at auction in this city lately, for the extraordinary sum of 1,130 dols., the highest price ever paid for a printed book in this country.—*New York Tribune.*

THE BARBARA CHASED.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XIV.

I AT length lost all patience at the non-arrival of the expected interpreter, and rising, made a profound salaam to the chief, which was, I saw, accurately imitated by Jack, who was at my side with a comical expression of countenance not indicative of much respect for the great man. The chief said something which I understood to mean that he hoped I would remain longer, but as I really was anxious to return on board, I only bowed again lower than before, and pointed

towards the harbour, continuing to move in the direction of the entrance. He did not attempt to stop me, and the people who had come with me were, I saw, prepared to accompany me back. I had just reached the outside, when I saw approaching an individual dressed in the native shirt and *sarong*, or kilt, whom I naturally took to be a Javanese. He stopped and looked at me attentively, saying in Dutch, "I was sent for by the chief to come and interpret for a French gentleman who has arrived here on some diplomatic business of importance. I shall be happy to do my best, but you are aware that some of the troops of your countrymen

will be here soon, and that then there will be no lack of people better able to interpret for you than I am. You of course know that the English attempted to make a landing, but have been defeated, and it is thought probable that they will make another attempt in this direction." He appeared to say this in a very significant manner. The information he gave might or might not be correct, but there was a friendliness in his look and tone which led me to suppose that he knew I was English, and that he wished to warn me of my danger. I was doubtful what to say in return, but quickly resolved to hurry down to the watering party to advise them to return on board and to warn Captain Hassall, that he might be ready immediately to get under weigh. I turned to the seeming native, whom I now discovered to be a Dutchman, and thanked him for what he had told me, remarking that our business was of no consequence, and that as it was possible the wind might change, I proposed returning on board at once. He smiled, and said that he thought it was the best thing I could do. This convinced me of his good feeling, and that he knew I was English. Just at that moment a guard of soldiers emerged from the palace, and their officer addressing the Dutchman, made signs to me that I was forthwith to return.

"I am sorry," observed the Dutchman to me in English, "we must attend the summons, but your boy need not, and you may send him to let your companions know where you are."

I took the advice and ordered Jack to find his way down to the boats, and to tell the mates to hurry on board with or without water, and to advise Captain Hassall to get under weigh immediately. I added, "Tell him to stand off and on for a couple of hours. If I am at liberty I will put off in a native boat, but if I am detained, tell him to save the ship and cargo, and that I hope before long to make my escape."

Jack fully understood my message, but I must say to his credit, that he seemed very unwilling to leave me to my fate.

"I am in no danger," I remarked, "I may possibly be detained a few days, but I am not likely to suffer any other inconvenience. Now, quick, my lad, or the ship and all hands may be caught in a trap."

Jack gave me a nod, and was off like a shot. I scarcely expected, however, that he would be allowed to go free; but no one I suppose had received orders to stop him, and so he pursued his way unmolested. The officers of the guard had, in the meantime, been speaking to the Dutchman, who told me that I must return forthwith, as the chief was waiting to receive me. I of course could do nothing else than face about, and with my new friend accompany the guard. The men were armed with formidable long spears and daggers, but the officer carried a musket, which looked more like an ensign of authority than a weapon to be used. As I returned through the courtyard I considered what I should say to the chief. "Tell the truth and be not afraid," said conscience. I determined to do so.

When I re-entered the hall of audience, the chief was seated on his divan, and evidently intended to receive me in greater state. Some of the assemblage sat down cross-legged on cushions in front of the divan, while others stood with their bodies bent forward on either side, the guards who remained turning their backs on the great man. The Dutchman and I took our seats on cushions directly below the divan. I found afterwards that among the Javanese a sitting posture is considered more respectful than an upright one. The chief, through the Dutch interpreter, now

asked me a number of questions, which, according to my previous determination, I answered correctly. The great man, I thought, looked somewhat surprised at finding that I was not so important a person as he had at first supposed. Occasionally my Dutch friend remarked that I had better not reply to some of the questions put to me, but I answered that I was perfectly ready to stand by the consequences of any thing I might say. Such has been my practice through life—I might say, more modestly, my endeavour—to do right on all occasions, to avow whatever I have done, and to take the consequences, whatever they may be. I do not say that such a mode of proceeding may not occasionally get a man seemingly into trouble, but I do say that it is the only right course, and that he is equally certain to get out of it again; whereas an opposite course must lead him into difficulties, and involve him more and more as he tries to extricate himself by prevarication, subterfuge, or falsehood. I therefore told the chief that I had come on shore hoping to open up a trade with him, under the belief that the country was no longer either in possession of the Dutch or French, but that it was now under the rule of England. If I was mistaken I was ready to undergo the penalty, and must run the risk of being treated as a prisoner of war should I fall into the hands of the French, but that as the English were the friends of the rulers and people of Java, I expected to be treated by him as a friend. This answer, which I had reason to believe the Dutchman faithfully interpreted, seemed to please the chief. However, he made no direct reply to me, but spoke for some time aside to his companions, whom I took to be officially counsellors or advisers. One made a remark, then another, and at last one said something at which I thought my friend the Dutchman looked rather blank. A good deal of discussion took place, when I heard the chief issue some orders to the officers of the guards. Immediately on this, two of the counsellors got up, and with the officer and several other persons and part of the guard, left the hall.

The movement seemed to give great satisfaction to the counsellors, especially to the gentleman who had made the suggestion, as I fancied, which led to it, while a pleased smile played over the countenance of the chief. All the time the honest Dutchman looked very much annoyed. At length I asked him what it was all about.

"I suppose that I shall not be found fault with for telling you," he answered. "And I assure you that I would much rather not have to give you such unpleasant information. Do not look surprised or annoyed, and no harm can come of it. The fact is that the chief here, the governor of this district, Mulock Ben Azel, is not a bright genius, and though he had made up his mind to detain you, it had not occurred to him to detain your vessel. The idea, however, was suggested to him just now by one of these cunning gentlemen, and he has sent a party to stop her. The Javanese are rather daring fellows, so that the captain must be smart if he could get away from them."

This was indeed a disagreeable announcement. I congratulated myself, however, at having sent off Jack to warn Captain Hassall, and I had great hopes that he would have followed my advice, and got the Barbara under weigh before the Javanese could reach her. I thanked the Dutchman for his sympathy and kindness.

"I have a warm regard for the English," he answered; "I have received much kindness at the hands of your countrymen, and am glad of an opportunity of proving my gratitude. As far as you are concerned I may be of service, but if these gentry get hold of your vessel, I

am afraid that they will not let her go till they have cleaned out her hold."

I, of course, on hearing all this became very impatient to go and see whether the *Barbara* was leaving the harbour, but, as far as I could, I concealed my feelings, and desired my Dutch friend to inquire of Mulock Ben Azel whether he desired my presence any longer; and if not, I begged leave to go forth into the open air that I might gaze on the beautiful scenery amidst which he had the happiness of dwelling and I had the happiness of finding myself. I fancy that the interpreter gave my request a more oriental turn. The chief was at all events pleased to comply with it, and directed some of his attendants and my Dutch friend to accompany me. I made a profound salaam, as if I was highly pleased at all that had occurred. The act was somewhat hypocritical I must confess, but, at all events, I was heartily glad to get over the audience, which was becoming very tedious.

As soon as I got out on the terrace I have before described as affording a magnificent view of the surrounding country, I eagerly looked seaward in search of the *Barbara*. I almost gave a shout of satisfaction as I saw her with a strong breeze offshore, standing away under all the canvas she could carry. She had good reason to make the best use of her heels, for a whole fleet of boats, some of considerable size and full of men, were in hot chase after her. I stood with my companions eagerly watching the chase, though the objects of our interest were very different. I was anxious that the *Barbara* should escape, they that she should be caught. I knew for one, though, that if good seamanship would enable him to get away, Captain Hassall would give his pursuers the slip. I knew too that he would not be taken, even if the boats should catch him up, without a fight. My earnest hope was therefore that the breeze might continue. In that climate, however, the land wind often falls towards the evening, and if it should do so, it would give the Javanese a great advantage. I found my new friend by my side, I glanced at him.

"Your vessel sails well, and I am glad of it," he observed. "The orders were to bring her in at all risks; at the same time, if her captain shows a bold front I do not think the natives will dare to attack him at a distance from the land."

My hopes and fears alternately rose and fell as I watched the chase. Sometimes the boats seemed to be gaining on her. At other times she appeared to be obtaining the advantage. She continued to increase her canvas till every stitch she could carry was set on her, studding sails on either side, royals, and even still lighter sails above them, which we used to call sky-scrappers. I now observed that although there were several large boats engaged in the chase, they were but slow sailers, and that the small ones were drawing ahead of them. These of course would be more easily dealt with by the *Barbara's* crew than the larger craft. The latter were vessels of about forty tons, carrying fifty or sixty persons. The hulls of those I had seen on landing were neatly built, with round heads and sterns; and over the hulls were light small houses, composed of bamboos, and divided into three or four cabins. The sides were formed of split bamboos about four feet high, with windows in them to open and shut at pleasure; the roofs were almost flat, and thatched with palm leaves. The oars are worked by the crew standing at the fore and after part of the vessel. I thought that probably the boats now in chase of the *Barbara* were modifications of this sort of craft, and more adapted to warlike purposes than they were. The natives became at length

even more excited than I was as the breeze occasionally fell and gave their boats an advantage. They knew also that the land breeze would soon set in, which I did not. They probably fancied that when it did, the vessel would be caught in a trap, not knowing that she could haul her wind and still keep ahead of them.

I stood watching the various circumstances of the chase, till at length, greatly to my relief, I saw the boats, as if by signal, begin to return together towards the shore, while the *Barbara* continued standing off shore till she met the sea breeze, when she hauled her wind and stood away to the northward. My Dutch friend congratulated me on her escape.

"And as it appears that you are not to be detained as a prisoner, the sooner you get out of this place the better," he observed. "I will gladly welcome you to my abode, where you can remain till we gain further information as to the result of the British expedition against Batavia. If it is ultimately successful, your ship will put in at that place, and you can rejoin her there."

I gladly accepted his offer. As we passed through the large entrance-court he pointed out two large Indian fig-trees, and told me that under them was the place where criminals were executed. On each side of the court was a row of the same description of tree. We descended the hill towards the harbour. On approaching it I heard the shrill voice of a boy crying out loudly amid the shouts and chattering of a number of natives. I soon recognised the voice of Jack Dobbs, who had, I had hoped, made his escape in the boats. The people, seeing me accompanied by guards, made way for Jack, who ran towards me crying out—

"Oh, save me, Mr. Braithwaite, save me, sir. These savages are a-going to cut off my head, or to hang me up and cook and eat me. They eat people in these parts, and they look as if they would make nothing of devouring me."

In vain I tried to pacify him. He seemed to fear that the natives were going to treat me in the same way he thought that they were about to treat him.

"But what made you come back, Jack?" I asked. "I thought that you had gone off to the ship."

"What, leave you all alone among the savages!" he answered, looking up reproachfully at me. "No, no, sir. After you have been so kind to me, and always took me with you wherever you've been, and we was nearly all drowned together! No, no, if harm is to come of it, I says to myself, I'll go shares with Mr. Braithwaite, whatever happens; so, when the boats shoved off, I scud away, and when the men called me to come along with them, and not to mind you, for that I could do you no good, I wouldn't go back, but kept beckoning them to be off; so away they went, and I ran up in shore and hid myself. The savages, howsoever, found me out at last, and as long as they thought that they should get hold of the ship they treated me civil enough, as they might a pet monkey; but when they found that they could not catch her, they turned their rage on me, and what they are going to do with us I'm sure I don't know, oh dear! oh dear!"

Jack's fears were very natural, for the dark-skinned, half-naked Javanese, with their glittering kreeses or daggers in their hands, which they flourished about while they vociferated loudly, were very ferocious-looking fellows.

"They are disappointed," said the Dutchman, "at the escape of your ship, and they accuse the boy of being the cause of the boats going off and giving her warning. Let him, however, keep close to me, and I will do my best to protect him."

My new friend, who, by-the-by, told me his name was Peter Van Deck, now addressed the people and told them that the boy was not to blame; whatever he had done was in consequence of the orders he had received, and that he had no intention of offending them. I had slipped a few small pieces of coin which I had fortunately in my pocket into his hand, and on his distributing these among the most influential of the assemblage public opinion was turned completely in our favour, and we were allowed to proceed without further molestation. A small sum bestowed on the officer of the guard had a like beneficial effect, and after receiving an assurance from Mynheer Van Deck that we would not run away, and would be found at his house if wanted, he and his men, very much to my relief, took their departure, while the Dutchman, Jack, and I, set off in an opposite direction.

The island of Java, it must be remembered, runs about due east and west. Our course was towards the west, or in the direction of Batavia. There was, however, not far off, about twenty miles I understood, a town and fort, garrisoned by French troops, called Cheribon. The scenery was very fine, heightened by the luxuriance of tropical vegetation. On our left rose a succession of heights beyond which appeared the summits of the ridge of lofty mountains which runs down the centre of the island, dividing it longitudinally into two parts, of which, however, the northern is the largest, most fertile, and best known. My Dutch friend was very communicative respecting the productions of the country, and the manners and customs of the inhabitants. I noted down, therefore, the information I received from him, which I give in as concise a form as I can.

The climate is certainly hot, as might be expected from being so near the equator, but it is much more endurable than I had expected to find it, and on the sides of the mountains it is often quite cool, so that thick clothing is necessary. As also the nights are nearly the same length as the days, there is time for the air to cool while the sun is below the horizon. The bad or unhealthy monsoon blows from the west, from the end of November to the beginning of March. This is the rainy season. After it the easterly winds blow for some time. The breaking up of the monsoon is the most unhealthy season of all. There are no navigable rivers, but numerous streams descend from the mountains and irrigate the land. One of the chief productions of this country is pepper. It is produced from a plant of the vine kind, *Piper nigrum*, which twines its tendrils round poles or trees, like ivy or hops. The pepper-corns grow in bunches close to each other. They are first green, but afterwards turn black. When dried they are separated from the dust and partly from the outward membranous coat by means of a kind of winnow, and are then laid up in warehouses. The white pepper is the same production as the black. It undergoes a process to change its colour, being laid in lime, which takes off the outer black coat and leaves it white. Rice is also produced in large quantities. It grows chiefly in low fenny ground. After it has been sown, and has shot up about half a foot from the ground, it is transplanted by little bundles of one or more plants in rows; then, by damming up the many rivulets which abound in this country, the rice is inundated in the rainy season, and kept under water till the stalks have attained sufficient strength, when the land is drained by opening the dams, and it is soon dried by the great heat of the sun. At the time of the rice harvest the fields have much the same appearance as our wheat and barley fields, and indeed are uniformly covered

with a still more brilliantly golden hue. The sickle is not used in reaping the rice, but instead of it a small knife, with which the stalk is cut about a foot under the ear; this is done one by one, and the ears are then bound in sheaves, the tenth of which is the pay of the mower. The *paddee*, which is the name given to the rice while in the husk, does not grow, like wheat and barley, in compact ears, but, like oats, in loose spikes. It is not threshed to separate it from the husks, but pounded in large wooden blocks hollowed out, and the more it is pounded the whiter it becomes when boiled. Rice, with fish or a little meat chopped up, constitutes the chief food of the inhabitants. Sugar, coffee, and indigo, are also largely produced. For the purposes of agriculture buffaloes are used instead of horses. They are very large animals, bigger and heavier than our largest oxen, furnished with great ears, and horns which project straight forward and bend inwards. A hole is bored through the cartilage of the nose, and these huge animals are guided by a cord which is passed through it. They have little eyes, and their colour is generally ashy grey. They are so accustomed to be led three times a day into the water to cool themselves, that they cannot without doing so be brought to work. The people themselves, by-the-by, are great bathers, both men and women, the children, who seldom wear clothes till they are seven or eight, being constantly in the water. That said custom must be a great saving of expense to the parents of a large family. The people are generally of a light brown colour, of a middle height and well proportioned, with a broad forehead and a flattish nose, which has a slight curve downward at the tip. Their hair is black, and is always kept smooth and shining with cocoa-nut oil. The dress of the women consists of a piece of cotton cloth wrapped round the body and covering the bosom, under which it is secured; it then hangs down to the knees, and sometimes to the ankles, while the shoulders and part of the back remain uncovered. The hair of their head, which they wear very long, is turned up and twisted round like a fillet, fastened with long bodkins of different sorts of wood, tortoise-shell, silver, or gold, according to the rank of the lady. It is often adorned with a variety of flowers. The Javanese are nominally Mohammedans, but in the interior especially a number of idolatrous practices are still kept up.

Pleasantly conversing we at length reached the residence of Mynheer Van Deck. It was built in the best style of native architecture, that is to say, on a raised platform of stone or brick; the outer walls were of brick, with a verandah of bamboo, all round which the partitions, as was most of the furniture, were of bamboo, which had a very cool appearance, and was sufficient for a hot climate. My host was a bachelor, not from choice, he assured me, but from necessity, on account of the scarcity of European ladies in the island.

"Those who are born here are so ill-educated, and so indolent, that a man is better without their society," he remarked.

In spite of this drawback he received me very hospitably and kindly, and though I was vexed at having again been separated from my ship, I confessed to myself that I had very little cause to complain of my lot. I was leaning back on an easy bamboo chair and gazing out through a vista of palm-trees on the deep blue sea when the clatter of horses' feet coming along the road caught our ears. As they drew near the clank of sabres was heard at the same time. The voice of an officer crying "Halt," was heard, and soon afterwards

we saw him approaching the house. My host, with a look of considerable annoyance, rose to receive him. He was a young and pleasant-looking man.

"Ah, Mynheer Van Deck, bonjour," he said. "You have in your house, I am given to understand, a foreigner, supposed to be an English spy. I am come to demand him from you."

"I am the person to whom you allude, monsieur," I said, rising from my seat and going forward. "You are, however, wrongly informed. I am an Englishman, but not a spy. I landed, not knowing that this part of the island was in possession of the French, and had I not been detained I should have returned to my ship."

"I am not here to dispute the point, monsieur," he said, bowing politely. "I must perform my duty, and that is to convey you with me to Cheribon, where my superior officers will investigate the matter. You have supped, I conclude; we will therefore take advantage of the cool of the evening, and make good as much of our journey as the waning day will allow us to perform."

My Dutch friend shrugged his shoulders. There was not much time for consideration. I saw that I had no resource but to obey, though I must own that I did so with a very bad grace.

JOHN PHILLIP.

Among the artists of our own time there has been none who rose more steadily and deservedly to reputation than the late John Phillip. His merit was emphatically of that sterling kind which never achieves fame by a sudden stroke, because it does not appeal to the half-educated eye, and will not play fast and loose with artistic truth in order to win popular favour. But it was of a kind that was sure to make its way among those best qualified to judge, and who are the natural

and rightful leaders of public opinion. Thus it was that, although Phillip did not at any time "take the town by storm," as some now nearly-forgotten celebrities have done, he yet advanced regularly from good to better, and from better to best—never, during the whole of his too short career, retrograding a single step—and eventually took his right place in the very foremost rank of his profession, that place being assigned him not merely by the applause of his countrymen, who hailed with delight every fresh production of his genius, but also by the concurring suffrages of his brethren and rivals in art. Any time during the last twenty years it has been evident to all competent judges that he was pursuing his upward course with undeviating certainty, and that he was destined, if he lived, to attain to the greatest eminence. His contributions to the Royal Academy were anticipated with eager interest, and were received year after year with more lively admiration and ever warmer praise. Such praise and admiration were richly due, because his works, his later ones especially, embodied the highest excellencies of the limner's art: in design simple and tender, playful or serious, romantic or humorous, according to the nature of the subject, they were always marvellous in their execution, revealing the possession of a power in the management of his material such as few artists ever attain, and which none of his contemporaries could fairly claim to rival. The colouring of his later works—those which he produced after studying the best specimens of the Spanish school—may be worthily classed with that of Velasquez, whose manner he seems to have studied carefully, while he as carefully steered clear of mere surface and technical imitation. In his Spanish pictures the atmosphere and general tone are as Spanish as the figures, while the entire subject is invariably rendered with a force and vigour equal to, and sometimes surpassing, that of the old Spanish masters themselves. This result of study is the more remarkable, that Phillip's earliest works, which we can recall to mind as they were exhibited nearly thirty years ago, gave little or no intimation of this dormant power.

John Phillip, one of the artists of whom Scotland has reason to be proud, was born at Aberdeen in April, 1817. His parents were of humble origin, and without the means of cultivating the talent for art, of which he gave promising indications very early in life. They apprenticed him, however, to a painter and glazier in his native town, and while following this craft the boy appears to have made his first attempt at oil painting, and to have produced some portraits, probably executed with house-painting materials, affording unmistakable evidence of a capacity for art which wanted but the opportunity to be developed. Mr. G. Huntley Gordon, writing in the "Athenæum," states that his father, the late Major Pryse Gordon, was the first to discover Phillip's genius. The boy, he tells us, had been sent by his master to the major's house to put in a pane of glass, being strictly charged to get the job done before that gentleman should come down to breakfast. But when the major came down he found that nothing had been done, and he accordingly reproved the lad for his idleness, when the latter, somewhat shamefacedly it may be assumed, excused himself on the ground that he had not really been able to take his eyes off the pictures that hung in the room. It was not surprising that the major should feel interested in such a youth, or that he should stretch out a hand to befriend him. Ere long he gave him a letter to

Lord Panmure, recommending the bearer of it to his lordship's favourable notice. The reply was characteristic: in it Lord Panmure undertook the charges of Phillip's education as an artist, urging his friend the major to use all diligence in freeing the lad from his present engagements, "to be prompt and spare no expense," and enclosing at the same time a cheque for £50. "Thus," says Mr. Gordon, "was Phillip made comfortable during his academical studies, and for some time after, until commissions began to flow in upon him."

In the summer of 1834 Phillip, then in his eighteenth year, came up on a holiday trip to London, to see the annual exhibitions. At that date he must have seen the works of Wilkie, of Collins, of Turner, and of Constable, on the walls of the Royal Academy Exhibition, and he doubtless drew from them incentives to sedulous labour and study. Three years later he came again to London, and this time remained in town two years, residing near Fitzroy Square, and entering himself as a student at the Royal Academy, and even sending some of his own productions (portraits) to the exhibitions of 1838 and 1839. He appears to have had from the first great facility in portraiture, and he continued to practise this branch of his art, of which he had formed a high estimate, to the end of his life. What were his first essays at subject painting does not appear, but he sent his first picture of this class, "Tasso in Disguise relating his Persecutions to his Sister," to the Royal Academy Exhibition in 1840, where it failed to attract attention or excite remark, being hung with the miniatures and water-colours in the architectural room.

The next seven years of his life Phillip passed in his native city, earning a competence by his portraits and his subject pictures of Scottish social life, the majority of them illustrating events connected with the Kirk of Scotland, to which he always showed a partiality, and one of which, the "Presbyterian Catechising," first brought him into notice in London. This picture he exhibited on his return to town in 1847, and from that date he sent his compositions regularly to the Academy, not always reaping the encouragement he deserved, but working on with energy unsubdued, and maintained by the inward conviction that the success he aimed at would be won. His exhibited pictures for the next few years were, "A Scotch Fair," in 1848; "Drawing for the Militia," in 1849; "Baptism in Scotland," in 1850; "Scotch Washing," and "The Spae Wife," in 1851.

Phillip's health was never very robust, and about this time it showed evident symptoms of giving way; he was advised, therefore, to leave England for some more genial climate, at least for a time, until the unfavourable symptoms should disappear or abate. Most English artists, when thus exiled by necessity, betake themselves to Italy as the land of art, and to Rome as the home of the artist. If Phillip had done the same, it is possible that he would never have won the fame that has crowned his life, although he would not have failed to distinguish himself. Happily for himself, and for the arts of England, his inclinations led him to Spain, where he took up his residence in Seville, remaining there several months, during which his health improved, while he industriously sketched the various features of Spanish life, and laid up a rich store of materials for future use. The result of his studies in Spain was strikingly manifest in two pictures which he sent to the Academy in 1853—"La Perla de Triana," and "Life among the Gipsies at Seville;" and still more re-

markably in two exhibited in the following year, one being the portrait of Lady Como Russell, and the other "The Spanish Letter-writer," which he painted for the Queen. He made no secret of the fact that he had adopted the method of the Spanish painters, and was pleased when the remark was made that the influence of Velasquez was clearly traceable in his work. Indeed he had intended nothing less, for he had studied the manner of that great painter with the determination that it should become his own, and he copied some of his finest pictures as closely as they could be copied—executing such tasks, it is said, with incredible rapidity, to the utter amazement of the native students who watched him as he worked.

Phillip repeated his visits to Spain from time to time, and during the remaining years of his life continued to enrich our home collections by the production of a series of unrivalled pictures, chiefly of Spanish subjects, which were received by the public with almost unvarying delight and commendation. Among the most remarkable of the Spanish pictures were, "The Gipsy Musicians of Spain," of which we give an engraving; the "Aqua Bendita," a picture beyond all praise, both as to design and execution; the "Boy Murillo selling his Pictures in the Market-place;" and the grand touching picture, "La Gloria, a Spanish Wake," a large canvas flooded with light, alive with the forms of mingled revelry and sorrow, and evidencing in every part the wondrous power and facility of hand the painter had by this time acquired. Alternating with the Spanish subjects were occasionally some masterly portraits, and some themes of Scottish life, such as "Sunshine in the Cottage," and "Collecting the Offerings in a Scottish Kirk," which the reader will perhaps remember; and two remarkable pictures of national interest, "The Marriage of the Princess Royal," painted by order of her Majesty, which picture has been truly described as the best pageant picture ever hung on the walls of the Academy; and the "House of Commons," painted for the late Speaker, which drew such crowds of admiring spectators around it a season or two ago. The last pictures from the easel of this distinguished artist—at least, so it is stated—are two fine Spanish subjects, relating to the national lottery, one representing the purchase of the tickets, the other the results of the drawing. In the first, the crowd are thronging to buy, eager to get their lucky numbers, and all hoping to win; in the second, the die is cast; the winners who laugh are few, and the losers with their long faces are many. In both of them there is a fund of humour and character, and of covert yet caustic satire; and both are distinguished by the painter's customary strength of colour and vigour of treatment. These two pictures were exhibited, not at the Royal Academy, but by the Messrs. Agnew, during the summer of last year.

As a man, John Phillip was genial and generous, ever ready to do a kindness to others. He hated bickerings, and resentments, and quarrels of all kinds, almost as much as he loved his art, and would rather at any time make a concession not due from him than risk a disagreement. The circumstances of his death were as sad as the event was unexpected. He was sitting as a guest with a brother artist, conversing on the subject he liked best, when he was struck by paralysis. He was taken home speechless, and never rallied, but died after a few days, on the 27th of February, 1867, having nearly completed his fiftieth year.

John Phillip was elected Associate of the Academy in 1857, and a Royal Academician in 1859.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER IV.—THE ALPAJURROS.

THE town we first stopped at, after Almeria, was Macael, one little known to the generality of travellers, but more singular than half the places they visit, and more full of association with the past. It lies beneath the Sierra de Filabres, a most remarkable country. Hence came the thousands of pillars, columns, slabs, gateways, and arches, with which the Moors embellished their matchless cities, Granada and Seville. The white marble looked dazzling in the sunshine, or rosy beneath the influence of its rays when rising or setting. The ancient chronicles give the most graphic description of the working of these quarries. Now solitude reigns where once resounded the carver's chisel, the hammer, the mallet, the gay songs of the women, and the busy hum of the workmen. Truly a deep melancholy seems to brood over everything in any way connected with that unhappy people. It was in the town of Purchena, in the immediate neighbourhood, that Boabdil, the last Moorish king, resided after his downfall. Parts of his alcazar, or palace, are still to be seen.

We were greatly struck on visiting the pine-forests, which are unequalled in Europe. At night in the winter season these lonely woods are much dreaded by the peasants, on account of the great number of wolves that frequent them; they do great damage to the sheep in the neighbourhood, and often the shepherd's life is sacrificed to his faithful guardianship of the flock. A very fine young man was pointed out to us, who had lost an arm, and would probably have lost his life, but for the courage of his faithful dog. We had local guides as long as we remained in the woods, as strangers would be lost amongst the numerous roads and paths. At the house inhabited by one of the foresters, the young girl (his only daughter) who waited upon us, told us that she was often left quite alone, when her father was absent at his work; we asked if she was ever frightened; she said not in the daytime, but that when she was left alone at night, the howling of these wild animals did sometimes terrify her, though she knew they could not get at her, and she always had at least two splendid Spanish mastiffs to guard her. At length we emerged again into the open country, the river Guadiana running through it, which is much used for floating down the immense masses of timber from these forests. As we were anxious to reach Baeza that night, we loitered no more on our way, but hastened on; still it was somewhat late, and the beautiful moon had been up some time ere we rode through the gates of the town, once prosperous under the dominion of the Moors. We spent one whole day at Baeza, partly to rest the horses and mules after the rough roads of the forest. Certainly my love of visiting unknown places was gratified here, for we could not make out that any English lady had ever been here. We were to retrace our steps to Almeria in one of the small carriages of the country, leaving our guides to bring on the horses and mules.

Guadise, our next point in our retrograde movement, is a charming place, the most cheerful town possible, buried in groves of mulberry-trees. It has fabulous claims to antiquity, the inhabitants being said to have been converted by San Torquato, one of the seven prelates sent expressly to Spain by St. Peter and St. Paul. The environs of this city are perhaps as curious as anything one can see in Spain: there are lofty crags, and picturesque defiles, and the arid soil contrasts

with the snowy glittering mountains of the Sierra, while the whole country is pregnant with metal and marble. Conical and pyramidal hillocks rise up on every hand, and caves are excavated in many of their sides, where dwell some of the poorer inhabitants.

It was delightful again to find ourselves on the shores of the beautiful sea at Adra, where we were again to start for a mountain ride into the Alpajurros. We were told that we had chosen the very best time of the year for seeing this country. From the watch-tower of Adra, in the olden times, called La Torre de la Vela, a tocsin rang out to summon all the inhabitants to arms on the approach of the African pirates.

I should think it impossible to attempt these roads in a carriage, for it was difficult even to ride. Our attention was also distracted by a variety of objects, the beauty of the flowers, and, as we passed through the villages, the curious, though certainly not pretty, faces of the women, who looked out at us from tiny holes, windows they could not be called, with their African-like faces, clear black eyes, and long black hair.

We rested in the Posada Nueva, at Berja, a town lying immediately under the Sierra de Gador, a mountain of lead. It is said that the working of the mines is very injurious to the health. The miners lodge on the hill, and owing to some odd regulation or superstition, neither women nor dogs are ever allowed to go near this hill. They are a most superstitious and ignorant race. We made a second excursion to see these mines from Llanjaron.

We were off early the next morning; and before the sun had cleared the golden mists from the mountains and valleys, we were riding past Ujjar, the capital of the Alpajurros, lying buried in hills, with the river Adra at the foot of them. So steep are these declivities, and yet so great the fertility of the land, that the peasants have to be fastened with ropes, and so let down to gather the wonderful fruit crops with which the valley teems.

The territory of the Alpajurros was assigned to the unfortunate Boabdil by the treaty of Granada, of which every stipulation was broken with the greatest perfidy. The wretched Moors were hunted out like wild beasts from their last strongholds, until finally expelled by the contemptible Philip III, who was a mere fool in the hands of the priests. Still it was no easy matter to root them out of their dearly loved glens and hills, and their resistance was desperate. When finally conquered and forced to go, they betook themselves to Tetuan and Sali, on the opposite continent, and taking up the trade of piracy they bitterly revenged themselves by their ferocious attacks on the Christians. The familiar name of "Sallee Rovers" had this origin. The folly of the Spaniards, who first of all expelled the Jews, and with them all commercial enterprise, from their country, and then drove out the eminently industrious agriculturists the Moors, could hardly be believed. The result was that the Spaniards, lazy, ignorant, unenterprising, and contented to go plodding on in the old way, soon found all the prosperity of their country disappear; and though the gold and treasure poured into its lap from the New World may have given for a time a fictitious prosperity, and revived something of its former greatness, Spain has never really prospered in later days. Many date her downfall from the establishment of the Inquisition, which, as well as the final expulsion of the Moors, occurred in the reign of Ferdinand and Isabella. The spirit of such an institution is as hostile to social as to religious progress.

The pretty little town of Llanjaron is much resorted to as a refreshing resting place when the heat on the coast becomes scorching and unbearable. It is at the head of the beautiful valley of Locrin, with the glorious Sierra Nevada closing it in behind. We spent a few days at this delicious spot, making excursions in the neighbourhood. The whole country is full of objects of artistic and natural interest, and as to the historical associations connected with every town, we might almost say every yard, of the district known as the Alpujarras, they are endless. The Sierras of Gador and Contrameja are thought by some authorities to be the hills called by the Moors "the hills of the sun and moon;" while the Sierra Nevada is the "snowy mountain." It is singular how poor and miserable the lower orders seem in the midst of all this wondrous fertility.

After leaving Llanjaron we made an excursion to the

mines of Berja, already referred to. A guide belonging to the district undertook to take us by a more direct route through the mountains. This change of route procured us some curious variety of scenery. Our way, for the most of the day, lay up the dry bed of a river, which in times of rain must swell to a great size, but was now shrunk to a tiny stream. It was bordered by arid mountains; there were neither villages nor hamlets; the whole country was solitary and savage. Towards sunset we arrived at the village of Cadior, surrounded by olive orchards with a small Vega, through which ran the river, bordered with willows. Here we put up at certainly the most wretched posada we had yet encountered; but we made light of the discomforts, and thought only of what we had seen and were to see on the morrow.

The next morning we resumed our journey; we procured still another guide to show us the way through some of the most intricate parts of the mountains. It was in this day's journey that we passed through scenes, the extraordinary rudeness and savage sublimity of which I shall never forget. Those who would know the Alpujarras in their true wildness must explore such lonely passes. We were at one time on the dizzy verge of vast precipices, with a chaos of marble mountains spread before us; at other times we travelled through deep ravines, with red rocks of immense height impending over us. Our guides went very cautiously, and praised our courage not a little. It appeared that ladies were often frightened at the reports of the roughness of the road, and so kept to more beaten

paths. After emerging out of one of these passes, which would have furnished a fine subject for the pencil of Salvator Rosa, we came to an open part of the country, where the sternness of the mountains was softened by the verdure of a small valley. The bed of the river passed at the foot of a height on which was a Moorish-looking village with flat-roofed houses, with vines, fig-trees, and oranges growing about them. Here we halted, and arranged our mid-day repast on a piece of flat rock in the dry bed of the river.

CHAPTER V.—GRANADA.

GRANADA, beautiful Granada! After passing the famous bridge of Vinos, the scene of many a fierce encounter between the Moors and the Christians, and more remarkable as having been the place where Columbus was overtaken by the messengers of Isabella when about to abandon Spain in despair, we turned a promontory of the arid mountains of Elvira, and Granada with its towers, its Alhambra, and its snowy mountains, burst upon our sight. The evening sun shone gloriously upon its red towers as we approached it, and gave a mellow tone to the rich scenery of the Vega. The glowing light over the natural scenery was like the magic glow that poetry and romance have so long shed over this enchanting place.

Who could remain many hours in Granada and not hasten to the matchless Alhambra? It is not my purpose to repeat details which may be found in any guide-book, but to give my own impressions as day after day I wandered about these beautiful remains. Strange that in an age so remote the Moors should have shown tastes so refined, and habits as elegant as those of the most advanced nations of the present day. The delicately ornamented walls, the aromatic groves, the refreshing and enlivening sound of fountains and running water; the exquisite retired baths, bespeaking purity and refinement; the balconies and galleries open to the fresh mountain breezes, overlooking the loveliest scenery of the valley of the Darro and the magnificent expanse of the Vega—in fact, everything around excites admiration. It is impossible to wander through this delicious abode, and not feel surprise at the genius and the poetical spirit of those who first planned and constructed it.

At the time of our arrival the foliage of the trees was still tender and fresh. The pomegranate had not shed its brilliant crimson blossom, the orchards of the Xenil and the Darro were in full bloom, the rocks were covered with wild flowers, and Granada seemed completely surrounded by a wilderness of roses, among which innumerable nightingales sang. I think the sight that interested me the most after the Alhambra was the tombs of the conquerors of the Moors, Ferdinand and Isabella. I could not be satisfied with one visit, but I often rambled there by myself to contemplate Isabella's statue and moralise. It is still possible, notwithstanding the numerous revolutions and storms that have shaken nearly every nation, to gaze at the veritable coffins of Ferdinand and Isabella. No indignity has ever been offered to these royal coffins, no desecrating hand has sought to unveil their mysteries; there they lie, these coffins, rough, uncouth in shape, and singularly unornamented for the coffins of such magnificent sovereigns. The letter F. alone marks that of Ferdinand; and the vault where they rest is very small, and the door so low that I had every time to remember my head as I entered; but if one wishes to see their remains duly honoured, one must visit the Capilla de los Reyes, or Royal Chapel attached

to the cathedral, and visit it as often as I did; for its beauty, and the interest attaching to it, are both very great. The carved figures of the king and queen are most remarkable because they are the exact resemblance of them as they really were, not only their features,

likeness, it so entirely expresses the character of the woman and the queen.

The situation of Granada alone suffices to give it high rank among beautiful cities. It seems to rest upon its hills with a proud stateliness, overlooking the matchless

height, air, etc., but the very dress is known to be most accurate. The dominant wish of both—the expulsion of the Moors, and the bringing back the heathen to the true church—is displayed by carvings representing different scenes in the tragic history of that time. The giving of the key of the Alhambra by the unfortunate King Boabdil to the Cardinal Mendoza, is most curious, and appears as if it must have been a faithful representation of what occurred. But the splendid monuments of the Catholic sovereigns attracted me the most frequently; they are of the most beautiful alabaster, and on these sepulchres lie the figures of the king and queen side by side. Near them are the figures of Juana, their unfortunate daughter, and her handsome, utterly good for nothing husband. One feels that Isabella's statue must be a

Vega, or plain; snowy peaks towering aloft, present to the mind a perpetual idea of coolness, while they secure that luxurious supply of sparkling water which is a treasure beyond price in such a climate. Of the Generalife, the summer palace of the Moorish kings, but few traces remain to tell of former beauty and magnificence, only here and there a fragment telling of past glories. The cypresses are very picturesque and of immense age, and the view from the top of the hill on which the palace stood is lovely beyond description. The curious subterranean corn granaries which have been partly filled up, struck me very much, both at Granada and other places in Spain.

The beautiful Cuarto Real, formerly a Moorish residence, I visited more than once. I never wearied of gazing at those splendid bay-trees and myrtles, and

breathing the air scented with the perfume of the leaves. There is a good deal still preserved there. Some delicate white tiles I remember, with shining gold designs on them, which are unique, and some other rarely beautiful remains.

Here, as in other Spanish towns, the public walks are unrivalled in beauty. The walks, especially on the banks of that clear dancing river the Darro, are most delightful, with charming views on all sides. But what most delighted me in Granada, was the part of the town called Zaccatissi; it is the regular old Moorish quarter of the town; why it has been left so unmodernised, no one can tell. It is picturesque beyond any place I ever saw of the kind; the most curious portions of houses still remain in so tottering a condition, that it almost seems as if the strong stems of the vines that cover them held them together. And the inhabitants are as picturesque as their dwellings: here one sees a balcony thoroughly Moorish in character, there an Eastern arch, or a wall that is a picture in itself, perhaps a group of women crouched down by some fountain. The Xenil is a most lovely river; many a walk have I taken along its banks. Then another favourite haunt was the unrivalled fruit market. What a wonderful assemblage of the fruits of the earth! The different kinds of fruit were arranged with the utmost taste in booths shaped like tents. All the fruit was beautiful of its kind. What this market must be later on in the year, when more fruits are ripened, I really cannot imagine. All one's interest, all one's admiration almost, is so entirely given to the beauties of the Alhambra, during one's stay in Granada, that one is apt I believe to neglect many other objects worthy of attention; still I really think I have named the sights most likely to attract the attention of strangers.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."
COWPER.

NO. X.—CONCERNING COBBLERS.

I MAY not inaptly devote this October paper to a peep at the gentle craft, because the shoemakers claim October as their own special month. They form a truly large and important portion of the community. The last census showed that the members of the gentle craft throughout the United Kingdom were nearly 300,000 in number, more than 32,000 of whom belonged to the gentle sex; and the same census also established the fact that the greatest number in London of any class of workmen was attained by shoemakers, who headed the list of London trades with 33,481. In the various seats of the shoe manufacture, the gentle craft also takes the lead of other trades; and Sir Cusack Roney, in his recent work, "Rambles on Railways," even coins a word to express his contempt for "the shoddy shoeability," who kept the Birmingham railway a few miles distant from their metropolis of Northampton. That city was famous for its shoes from an early period, and was also the great mart for the "leather bottle." When King John was at Northampton, he gave one shilling for a pair of single-soled dress boots, and sixpence for a pair of slippers.* As the worth of money changed, it is

recorded that as much as seven shillings had to be paid at Northampton for the winter shoes of William of Blatherwyke, "fox hunter to Edward I," and his two assistants. Cromwell's army marched through Northampton to Leicester, in 1648, and being almost barefoot, were supplied by the citizens with 1,500 pairs of boots. The mud-boots for our Crimean soldiers also came from Northampton; and when Spencer Percival was member for the borough, he obtained Government contracts for the trade of the town, concerning which there is an old saying, "You may know when you are within a mile of Northampton by the smell of the leather and the noise of the lapstones." When the Queen passed through Northampton, in November, 1844, on her way to Burghley, the mayor presented to Prince Albert a pair of boots as a representation of the staple trade of the town. But when Queen Elizabeth passed through Northampton to Burghley, in 1564, it was considered politic to present her with a purse of 100 marks in place of shoes or slippers.

Shoemaking was one of the few manufactures in which, at the International Exhibition of 1862, the French confessed themselves to be surpassed by the English; although they limited this concession of superiority to men's shoes, and reserved to themselves the boast of making the best ladies' boots and shoes in the world. Dr. Johnson, who, in his Oxford student days, was too proud to attend lectures in his tattered shoes, said that "you might teach the making of shoes by lectures;" but it is taught experimentally at the Earlswood Asylum; and in the last report from that excellent institution, it is stated that among the various trades and pursuits that have been introduced for the benefit of the inmates, the one most sought after is that of shoemaking; but that although the sewing is well done, few of the afflicted patients can do the cutting-out work that is required in the trade. Some, however, have already been enabled to earn their bread outside the asylum by their proficiency in the shoemaking trade that has been taught them during their residence within the walls of the institution. The trade has well deserved the name of the gentle craft in its soothing influence on the mentally afflicted patients at Earlswood. On the other hand, in a return issued at the Horse Guards, March, 1865, it was stated that the largest number of any trade who had enlisted into the army were shoemakers. They headed the roll of trades with the figures 3,279, of whom 1,297 continued to practise their trade after enlisting.

The shoemakers claim October as their own month, because October 25th is St. Crispin's day, and St. Crispin is the patron saint of the gentle craft. The anniversary of that day, some four and a-half centuries ago, was a famous day, not only to shoemakers, but to all England; for, on October 25th, 1415, was fought the battle of Agincourt. The speech that Shakspeare has put into King Henry's mouth on the eve of that battle, has connected it with St. Crispin's name in words that will live so long as the English language exists.

"This day is called the Feast of Crispian:
He that outlives this day, and comes safe home,
Will stand a-tip-toe when this day is named,
And rouse him at the name of Crispian.
He that shall live this day, and see old age,
Will, yearly, on the vigil, feast his neighbours,
And say, 'To-morrow is Saint Crispian.'
Then will he strip his sleeve, and show his scars,
And say, 'These wounds I had on Crispin's day.' . . .
This story shall the good man teach his son;
And Crispin Crispian shall ne'er go by,
From this day to the ending of the world,
But we in it shall be remembered;

* "Pro I pari botarum singularum, xijd.," etc. See the "Historical Memorials of Northampton," by the Rev. C. H. Hartshorne.

We few, we happy few, we band of brothers ;
 For he to-day that sheds his blood with me,
 Shall be my brother ; he he ne'er so vile,
 This day shall gentle his condition ;
 And gentlemen in England, now a-bed,
 Shall think themselves accursed they were not here ;
 And hold their manhoods cheap, whiles any speaks
 That fought with us upon Saint Crispin's day."

King Henry V., act iv., scene 3.

And after the victory, when Montjoy the French herald comes to the king and says, "The day is yours," Shakspeare makes Henry utter the words, "Praised be God, and not our strength, for it !" and on finding that the neighbouring castle was called Agincourt, he says—

"Then call we this the field of Agincourt,
 Fought on the day of Crispin Crispianus."

The Crispianus or Crispian, or, as he is otherwise called, Crispinian, who is mentioned in King Henry's speech, was the brother of Crispin. According to Alban Butler, they were of noble descent and born at Rome, where they became converts to the Christian faith. They then travelled to France and established themselves at Soissons, where, following apostolic precedent, they supported themselves by the labour of their hands. During the day they taught and preached, but by night they worked as shoemakers. At length they were cast into prison by Rictius Varus, governor of Soissons under the Emperor Maximian, and were put to death with cruel tortures. The date of their martyrdom is fixed at 287 A.D. The old engraving by H. David represents them with the nimbus round their heads, dressed as shoemakers and working at their craft; and a pair of shoes was their emblem in the Clog Almanack.

So far, all is plain sailing, plainer even than usual; for Alban Butler does not assign any miracles to the two saintly shoemakers, though Lusius, in his "Acts of the Martyrs," makes the circumstances of their burial to have been miraculous. But when we turn to their history, as it is recorded in that quaint and rare little book, entitled "The History of the Gentle Craft," we are plunged into the sea of romantic fiction. This book, of which I possess a copy, is not to be confounded with those imaginary works, "The Hypodemia, or the History of the Passion of Shoe-buying;" "The Sutrina Hobeana;" "The Soleary System;" "The Ars Calcearia;" "The Scytotomical Decameron, or Ten Joyous Days in a Shoe Warehouse," mentioned in the prospectus of a book entitled "The Street Companion, or the Young Man's Guide and the Old Man's Comfort in the Choice of Shoes, by the Rev. Tom Foggy Dribble," to which an erudite article was devoted in "The London Magazine" for 1825, and which was an amusing burlesque, written by Charles Lamb, on the writings of his bibliomaniac and antiquarian friend, the Rev. Thos. Frognall Dibdin.

The book, however, is mentioned in that facetious and learned article by the gentle "Elia," as a "delectable little volume (him who possesses it I call neither an incurious nor an unhappy wearer of shoes) intitled The History of the Gentle Craft; imprinted in the yere of our Lorde, 1584." This *liber rarissimus*, Charles Lamb proceeds to say, was "marked in the catalogue of that most respectable house, Messrs Pain & Foss, at the very reasonable price of £15 15s.,"* at which communication, he adds, "let my old man instantly ring his bell, doff his padagian or sciatic envelopments, and autoschediastically hasten to the temple of the classic muse; let my heavy mettled young man, if he wish to

be thought worthy of wearing Spanish leather, instantly draw on a pair of hobbies, and fly to that far-famed spot, baiting his hook with a check for the sum; or, what is better, supplying the follicular foldings of his *bracee* with fifteen legitimate sovereigns." Charles Lamb's coinage of words in this sentence reminds me of Dr. Johnson, who, when Boswell challenged him with coining the word "depeditation," "owned he had made it, and added that he had not made above three or four in his dictionary."*

The narrative contained in this "History of the Gentle Craft"—which is illustrated "with a set of pictures entirely new;" woodcuts of the Catnach order—is far too long to be given here, even in a condensed form; but its compiler has acted precisely as so many novelists and dramatic authors do at the present day; he has boldly borrowed his plot and characters from the French, and has transferred them to English ground. He makes Crispin and Crispianus to be the sons of the King Logria—that district "which," he says, "is now called Kent;" and they lived at Canterbury. As they were of gentle blood, the trade of shoemaking, which they afterwards worked at, was called "the gentle craft." Glancing hastily over the tale of their adventures, we find their mother disguising them in mean attire and sending them out of the back-gate of the palace, in order that they might escape the cruelty of the tyrant emperor, who was exporting all the young princes and nobles to foreign countries, where they were sold into slavery. The two princes come to Faversham, where they hear some shoemakers singing at their work. They join them and become apprentices to a shoemaker, who, after they have worked for him five years, is appointed to be "the emperor's shoemaker." Crispin has to go to court to try on the new shoes of the Princess Ursula, who falls in love with him and very plainly tells him so. Crispin, in return, tells her that he is a prince, and proposes a secret marriage, to which she consents. He bribes a blind friar to marry them at Canterbury at St. George's Chapel, but the marriage is eventually solemnised in the King's Park. It is kept secret, and Crispin works on at his master's trade, while Crispianus is pressed to the wars, where he fights Iphicrates, the Persian general. As the Princess Ursula is expecting the birth of a child, Crispin confides his secret to his master and mistress, who receive the princess under their roof. There is a great hubbub at her disappearance, and her father, according to the accepted custom, proclaims that whoever finds her may marry her, provided that he be of noble birth. Thereupon Crispin takes his wife and child to court, and as Crispianus is also promoted to great honour for his victory over the Persian general, all ends merry as a marriage-bell. In relation to Crispin's child, the old saying is quoted, "A shoemaker's son is a prince born;" and this verse occurs in the Shoemakers' Song:—

"Our shoes were sewed with merry notes,
 And by our mirth expelled all moan;
 Like nightingales, from whose sweet throats
 Most pleasant tunes are nightly blown:
 The gentle craft is fittest then
 For poor distressed gentlemen."

There is another story in this same curious little book of "The History of the Gentle Craft," showing how it came to pass that shoemakers' tools came to be called "Sir Hugh's bones"—from some shoemakers having stolen the bones and converted them into tools. The story of Crispin and Crispianus, given in "The History

* I am unable to say whether any copy has actually been sold for this large sum. It was stated in the "Times" for February 24, 1853, that the copy sold at Lord Alvanley's sale was bought for £3 19s. I have met with reprints of the work bearing date 1723 and 1758.

* "Tour to the Hebrides," August 29.

of the Gentle Craft," is so far corroborated by an English tradition that connects them with the modern county of Kent; for Weever, in his "Funeral Monuments" (p. 271) says, that on the beach at Widde, near Stordend, there is "yet to be scene an heap of great stones which the neighbour inhabitants call St. Crispin's and St. Crispinian's tomb, whom they report to have been cast upon this shore by shipwreck, and from hence called into the glorious company of saints." They were not, however, the only two saints and martyrs of whom the gentle craft can boast, for, according to tradition, Anianus, the Bishop of Alexandria, had also been a shoemaker. Alban Butler says that Anianus had wounded his hand with an awl, and that St. Mark healed the wound and converted him to Christianity; but Robinson, in his "Ecclesiastical Researches," says that St. Mark, while walking in Alexandria, burst the stitching of his sandal and repaired to the stall of Anianus to have it repaired, after which he instructed him in Gospel truths.

St. Crispin's day is still observed on October 25th by all shoemakers, not only in England, but also in Scotland, where, at Stirling and elsewhere, the Crispin Club keep the feast in the modern degenerate way, testified to by the proverbial saying—

"On the 25th October
Ne'er a souter 's sober."

Dr. Rogers, in his "Familiar Illustrations of the Scottish Character," tells of a singular custom in connection with the sutors of Selkirk. "It was formerly the practice of the burgh corporation of Selkirk to provide a collation or *dejeuner*, on the initiation of a burgess. The rite of initiation consisted in the newly accepted brother passing through his mouth a bunch of bristles, which had previously been mouthed by all the members of the board. This practice was termed 'licking the birse;' it took its origin at a time when shoemaking was the staple trade of the place, the birse being the emblem of that craft. When Sir Walter Scott was made a burgess or 'sutor of Selkirk,' he took the precaution before mouthing the beslabbered brush, to wash it in his wine; but this act of rebellion was punished by his being compelled to drink the polluted liquor. This unrefined burghal habit continued till 1819, when Prince Leopold was created a sutor of Selkirk." (p. 140).

Glasgow is celebrated for its numerous clubs, and Dr. Strang has produced a learned work, bearing the title, "Glasgow and its Clubs." On Lord Palmerston's visit to Glasgow in April 1863, he was entertained at a breakfast given by the President of "the Gaiter Club," of which he was elected an honorary member. Here is his characteristic speech as recorded (by telegraph) in the "Times" of the following morning, April 2, 1863:—"Viscount Palmerston, having added his name to the list of members, said,—'I am very proud and flattered to be associated with such a distinguished body. I am informed, though gaiters have an intimate connection with legs, that no gaiterman is allowed to speak upon his legs. He may speak about his legs, but not upon his legs. Now, as we in these days never show our legs, inasmuch as trousers would conceal even the gaiter if we wore it, you will excuse me if I am very short in my thanks. I can only assure you that, whether I wear long gaiters or short gaiters, my memory of your kindness will be long, and not short.'" No man was happier when "on his legs" than Lord Palmerston, whether he had to speak as prime minister, gaiterman, or sutor.
